## PREFACE

The twentieth century has seen many startling developments in the first two-fifths of its course, but these—the automobile, the airplane, motion pictures, radio, and even the first World War, to name the high lights of the period—have been of comparatively slow evolution; they have unfolded from year to year as one turns the pages of a book, progressing from stage to stage with some degree of logical order. But the year 1940 has been a succession of shocks, of severe jolts not forecast by events of the preceding year nor dreamed of as remote possibilities in any future year. The European War of 1939, even with the devastating “Blitzkrieg” in Poland and the unexpected flare in Finland, did not seriously disturb the serenity of the world. It looked as if it might be a long-drawn affair, with the probability of ultimate German defeat as England and France gradually tightened the economic noose; but otherwise, except in Germany, the world was operating under the sign, “Business as Usual.”

By the end of 1940 that sign had been taken down—everywhere. No country in the world had altogether escaped some tremor, great or small, of the cataclysmic disturbance. War, until May confined to a few miles of a thin line between two countries, suddenly engulfed the whole of Europe, overflowed into Africa, and spread into ripples that touched and threatened the shores of every sea. Almost no line of industry or science or the ordinary affairs of life remained unaffected by the close of the year, anywhere on the globe. Hence, this issue of *THE NEW INTERNATIONAL YEAR BOOK* might rightly be called a “War Volume,” for almost no page does not reflect some touch from the innumerable tentacles of war. Music, literature, and art felt its fingers; medicine, sanitation, and engineering turned from peace to war problems; nations began to subordinate their programs for the normal progress of their peoples and to convert their factories into arsenals and their young men into armed forces.

To provide space for a full review of all the great developments of the year without increasing the bulk of the present volume over preceding issues and without sacrificing any of the former standards, certain modifications have been made in the presentation of some of the usual material. In each instance, however, the modification has permitted an extended amount of information. Thus, by the assembly of the data pertaining to universities and colleges into a tabular list, many more of such institutions are presented than heretofore. Similarly, a greatly extended list of “Societies and Associations” is offered under this title. Biographical sketches of the important persons who died during the year now appear under the heading “Necrology” without exception. Although these and other modifications were undertaken primarily as space-saving devices, it is believed that all of them tend to increase the convenience of the book for ready reference and to increase its value.

As with preceding issues of *THE NEW INTERNATIONAL YEAR BOOK*, the 1940 *YEAR BOOK* is also truly international in its scope. No country is so small that the most recent available facts pertaining to it are not included, and the larger countries of the world are treated with great fullness. Especial attention is given to statistics of population, education, production, trade, finance, government, and to historical developments, all as of the year 1940 or of the most recent date for which statistical information has been officially issued. Reviews in the fields of chemistry, physics, medicine, and other sciences are also international in character and treatment. It has been the intent of the editors to

▼

## PREFACE

omit no important development of the year in any major field of interest throughout the world. Naturally, however, as this book circulates chiefly within the United States, about one-half of its topics pertain to the commerce, industry, literature, sports, politics, transportation, and so on of this country.

The contents are, as usual, alphabetically arranged by subjects, and numerous cross-references serve to guide the consultant, not only to the main subject, but to the specific section within that subject that he may be seeking. For his further convenience, on page xvi is listed an index of certain special features to be found in the volume that he might otherwise overlook or be uncertain as to heading or location.

A book such as this, offered anew from year to year, must necessarily mark the appearance of new names among its contributing editors from time to time. Among those in this issue—new to these pages, but by no means new in the fields of their various subjects—are Dr. H. A. De Weerd, who presents a masterly review of the EUROPEAN WAR during 1940; Dr. Clarence B. Farrar, with a review of PSYCHIATRY; Dr. Ales Hrdlička, ANTHROPOLOGY; Philip Murray, CONGRESS OF INDUSTRIAL ORGANIZATIONS; Hans Olav, SCANDINAVIAN LITERATURE; Charles McD. Puckette, NEWSPAPERS AND MAGAZINES; E. E. Russell Tratman, various engineering topics, and Leroy Whitman, MILITARY PROGRESS. The editor welcomes these and other new contributors, and extends his gratitude to them, to the remaining contributors, and to the large number of men and women who, with no thought of recognition or remuneration, supplied numerous items without which much of the statistical information could not have been supplied.

The editor is unable adequately to express his deep appreciation of the services of his associates and his staff. Obstacles that seemed almost insuperable were met and overcome by their unremitting labor and unswerving loyalty. He is especially grateful to Mr. Ronald Kain who, faced with the tremendous complexities that the European War, the Russo-Finnish War, and the Sino-Japanese War thrust into the governments of the world, has labored far into many nights to present his usual clear accounts of the historical developments of all countries and to ensure the accuracy of statistical data affecting them. He is also deeply grateful to Miss Mamie Harmon who, aside from regular editorial duties, proposed and carried to their conclusions the solutions to many frustrating problems and also relieved him of many of the details connected with a work of this magnitude. Although he does not call the roll of the other members of his staff he is nonetheless appreciative of the value of their work and the earnestness with which they have carried it through.

THE NEW  
INTERNATIONAL  
YEAR BOOK

## SPECIAL FEATURES

A thousand or more titles will be found in the YEAR BOOK, arranged alphabetically from AAA to Zoology, and numerous cross-references will direct the reader specifically to the subject he seeks. For convenient reference, certain special features are listed below. For all other titles, see the main topic in its alphabetical position; as, "National Defense," see page 484.

	PAGE		PAGE
Agricultural Crops .....	14, 15, 338	Federal Expenditures .....	635

# THE NEW INTERNATIONAL YEAR BOOK

**AAA.** See AGRICULTURAL ADJUSTMENT ADMINISTRATION

**ABYSSINIA (ETHIOPIA).** See ITALIAN EAST AFRICA; EUROPEAN WAR under *Campaigns in Africa*

**ACADEMIC FREEDOM.** See EDUCATION; WYOMING under *History*.

**ACADEMY, French (Académie Française).** The oldest of the five academies which make up the Institute of France and officially considered the highest, founded in 1635. The membership is limited to 40. The list of the Immortals in 1940, in order of their election, was as follows: Gabriel Hanotaux, Henri Lavedan; Maurice Donnay, Marcel Prévost, Henri Bergson, Mgr. Alfred Baudrillart, Henri Bordeaux, André Chevillon, Édouard Estaunié; Georges Lecomte, Émile Picard; Louis Bertrand, Auguste de Caumont, Duc de la Force, Paul Valéry; Abel Hermant; Émile Mâle; Louis Madelin; Maurice Paléologue, Marshal Henri Pétain; André Chaulmeix; Gen. Max Weygand, Pierre Benoit; Abel Bonnard; François Mauriac, Maurice, Duc de Broglie; Léon Bérard; Marshal Louis Franchet d'Espérey; Claude Farrère, André Bellessort, Georges Duhamel, Louis Gillet, Edmond Jaloux, Joseph de Pesquidoux; Lucien Lacaze; Mgr. Georges Grente, Bishop of Le Mans; Jacques de Lacretelle, Charles Maurras; André Maurois; and Jérôme Tharaud.

On Jan. 11, 1940, the Academy elected Paul Hazard to the seat of the late Georges Goyau. The death of Henri Lavedan was announced from Vichy in September. See FRENCH LITERATURE.

**ACADEMY, Royal Italian.** See ITALIAN LITERATURE.

**ACADEMY, Spanish.** See SPANISH LITERATURE.

**ACADEMY OF ARTS, Royal.** See ART.

**ACADEMY OF ARTS AND LETTERS, American.** A society founded in 1904 by members of the National Institute of Arts and Letters for the purpose of furthering and representing the interests of literature, painting, sculpture, architecture, and music. Its membership is limited to 50 chairs, vacancies caused by death being filled by elections from the membership of the Institute.

The membership of the Academy as of Nov. 14, 1940, consisted of the following in the order of their election: George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Herbert Adams, Archer Milton Huntington, Newton Booth Tarkington, Charles Dana Gib-

son, Royal Cortissoz, Charles Downer Hazen, Wilbur L. Cross, Hermon A. MacNeil, James Earle Fraser, William Mitchell Kendall, Robert Frost, James Truslow Adams, William Lyon Phelps, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paulanship, Cecilia Beaux, Eugene O'Neill, Henry Dwight Sedgwick, Walter Lippmann, M. A. de Wolfe Howe, Frank Jewett Mather, Jr., Stewart Edward White, Deems Taylor, Charles McLean Andrews, Van Wyck Brooks, Herbert Putnam, William Adams Delano, Charles Warren, Bernard Berenson, Chauncey Brewster Tinker, Albert Spalding, Sinclair Lewis, Willa Cather, Stephen Vincent Benét, Ellen Glasgow, Thornton Wilder, Henry Osborn Taylor, Ralph Adams Cram, Edna St. Vincent Millay, and Carl Sandburg.

Beginning with Nov. 14, 1940, a joint exhibition of the works of Childe Hassam, a member of the Academy who died in 1935, and of Edwin Austin Abbey, a member of the Academy who died in 1911 has been shown in the art gallery, and will continue indefinitely. The Abbey paintings were lent by Yale University. This gallery and the permanent museum are open and free to the public from 10 a. m. to 5 p. m. weekdays and from 2 to 5 p. m. Sundays and holidays.

Officers of the Academy elected in 1940, were: President, Nicholas Murray Butler; Chancellor and Treasurer, Wilbur L. Cross; Secretary, William Lyon Phelps; Directors: Stephen Vincent Benét, Van Wyck Brooks, Walter Damrosch, William Adams Delano, Charles Dana Gibson, and Archer M. Huntington. Administrative offices are at 633 West 155th St., New York City.

**ACADEMY OF DESIGN, National.** An organization of American artists, established in New York City in 1825 and incorporated in 1828 for the purpose of "cultivation and extension of the arts of design." In 1906 the Society of American Artists merged with the Academy.

The Academy maintains annual Exhibitions of painting, sculpture, and engraving, to which all artists may contribute, subject to jury. At these exhibitions various prizes are awarded. It conducts an Art School at which no tuition is charged. It also administers the Henry W. Ranger Fund for the purchase of paintings, to be presented to various museums. Its membership is limited to professional painters, sculptors, engravers, and architects.

The Academicians elected at the annual meeting in April, 1940, were: Painters—Guy Pene du Bois, Dean Cornwell, Robert Brackman, Jon Corbino,

Ogden Pleissner, Roy Mason, Francis Speight, Theodore Van Soelen, Hugo Ballin. Sculptors—Gertrude Lathrop, Wheeler Williams. Architect—Grosvenor Atterbury. Graphic Arts—Thomas W. Nason.

The Associates elected in March, 1940, were: Painters—Isabel Bishop, Allyn Cox, Nan Greacen, George Harding, Robert K. Ryland, Ferdinand E. Warren, N. C. Wyeth. Sculptors—Cornelia Van A. Chapin, Nathaniel Choate, Janet de Coux, Donald de Lue, Herbert Haseltine, Gertrude V. Whitney. Architect—Eliei Saarinen. Graphic Arts—Roi Partridge, Grant T. Reynard, Cadwallader Washburn.

Elected officers were: Hobart Nichols, President; Edward McCartan, First Vice-President; John Taylor Arms, Second Vice-President; Charles C. Curran, Corresponding Secretary; Georg Lober, Assistant Corresponding Secretary; Charles S. Chapman, Recording Secretary; Frederick Ballard Williams, Treasurer; Charles Keck, Assistant Treasurer.

Headquarters are at Amsterdam Avenue and 109th Street, New York City, where there also is located the Academy's School, Charles L. Hinton, dean, and Virginia Ferrell, clerk of the Academy.

**ACADEMY OF SCIENCES, National.** The National Academy of Sciences was incorporated by Act of Congress in 1863 for the purpose of investigating, examining, experimenting, and reporting upon any subject of science or art whenever called upon by any department of the United States Government. Membership is by election, in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States. New members are elected by the Academy on nominations from its eleven Sections: Mathematics, Astronomy, Physics, Engineering, Chemistry, Geology and Paleontology, Botany, Zoology and Anatomy, Physiology and Biochemistry, Pathology and Bacteriology, and Anthropology and Psychology. The names considered by the Sections in their nominating ballots originate from suggestions made by members; consequently, there are no applications for membership.

At the Annual Meeting held in Washington, D.C., Apr. 22, 23, and 24, 1940, fifteen new members were elected, as follows: Rollin Thomas Chamberlin, Carl Ferdinand Cori, George Washington Corner, Louis Frederick Fieser, Wendell Mitchell Latimer, Karl Friederich Meyer, James Bumgardner Murphy, Isidor Isaac Rabi, Stephen Walter Ranson, William Jacob Robbins, Richard Edwin Shope, William Hay Taliaferro, Stephen Timoshenko, Ernest Glen Wever, Claus Hugo Hermann Weyl. Four foreign associates were elected: Bernardo Alberto Houssay, James Peter Hill, Giuseppe Levi, and Sir Henry Hallett Dale.

Three medals were presented at the dinner on Apr. 23, 1940:—The Agassiz Medal for Oceanography (gold), to Frank Rattray Lillie, past president of the Woods Hole Oceanographic Institution, for his important contributions to the science of Oceanography; the Public Welfare Medal (gold), to John Edgar Hoover, of the Federal Bureau of Investigation, for his application of scientific methods to the problem of crime prevention; and the Charles Doolittle Walcott Medal (bronze) and accompanying honorarium, to A. H. Westergaard, of the Sveriges Geologiska Undersokning, Stockholm, Sweden, for his eminent researches on the stratigraphy and paleontology of the Cambrian formations of Sweden.

raphy and paleontology of the Cambrian formations of Sweden.

The Autumn Meeting was held at the University of Pennsylvania, Philadelphia, Pennsylvania, on Oct. 28, 29, and 30, 1940. The Academy publishes an Annual Report, Biographical Memoirs of its deceased members, occasional scientific Memoirs, and monthly Proceedings. The officers are: Frank B. Jewett, President; Arthur L. Day, Vice-President; L. J. Henderson, Foreign Secretary; F. E. Wright, Home Secretary; J. C. Hunsaker, Treasurer; and Paul Brockett, Executive Secretary. The Academy building is at 2101 Constitution Avenue, Washington, D.C.

**ACCIDENTS.** The 1940 accident toll in the United States, according to National Safety Council estimates, amounted to 96,500 deaths, approximately 9,100,000 non-fatal injuries, and direct costs aggregating nearly \$3,500,000,000. These totals represent increases of about 4 per cent from the 1939 accident toll. In contrast, the preliminary estimate of property destroyed or damaged by fire alone was \$306,500,000, or 3 per cent below the comparable preliminary estimate for 1939. The trend of accidental deaths over the last decade has been mixed. In 1930 the total was 99,147. In 1932 it reached a low of 89,031, but in 1934 it was up to 100,977, and in 1936 to 110,052. These two high totals were in part due to a large number of deaths from excessive heat—also a factor in the 1940 increase.

The following table shows the 1939 and 1940 death totals for the four principal classes of accidents, together with the per cent increase in each class:

	1940	1939	Increase
All Accidental Deaths ...	96,500	92,623*	4%
Motor Vehicle	34,400	32,386*	6%
Public (not motor vehicle) .	15,500	15,500	No change
Home	32,500	32,000	2%
Occupational	17,000	15,500	10%

\* The 1939 figures for all accidents and motor vehicle accidents are from the U.S. Census Bureau. All others are National Safety Council estimates. The totals exclude the duplication of occupational and motor vehicle deaths.

Approximately half of the increase in total accident deaths came from motor vehicle accidents, and about a third from occupational accidents.

The 1940 accidental death rate per 100,000 population was 73.2. Comparable rates are: 1939, 70.7; 1930, 80.6; 1920, 71.3; 1910, 84.4. Heart disease, cancer, cerebral hemorrhage, and nephritis were the only causes of death exceeding accidents in 1939, according to U.S. Census Bureau data. Preliminary information indicates the same ranking for 1940. Among males, alone, accidents have for several years been either the second or third most important cause of death, being exceeded by heart disease and, in some years, cancer. From age 3 to 21 accidents caused more deaths than any disease in 1939. Among males they were first from age 3 to 38.

The 1940 accidental deaths were distributed by age as follows: 0-4 years, 6650; 5-14 years, 6550; 15-24 years, 12,500; 25-64 years, 43,400; 65 years and older, 27,400. The 1940 Census population figures are not yet available, but it is certain that the highest death rate per 100,000 population was for 65 years and older—in the neighborhood of 340. In contrast, the rate for children 5 to 14 years old was only about 27, or one-twelfth as much. In recent years the rate for elderly people has been

rising steadily, while that for school children has been going down.

**Motor Vehicle Accidents.** The 1940 motor vehicle accident death total of 34,400 represents an increase of 6 per cent from 1939. However, there were also 6 per cent more vehicle-miles driven in 1940, so the death rate per 100,000,000 vehicle-miles remained unchanged at 12.0. Since 1930, when the death rate was 17.4, there has been a 31 per cent reduction in the rate. In addition to the deaths, about 1,200,000 persons received non-fatal injuries in motor vehicle accidents during 1940, or one out of each 110 persons in the United States. Wage loss, medical and insurance costs amounted to about \$800,000,000, and property damage to approximately an equal amount—a grand total of \$1,600,000,000. The increase in motor vehicle deaths from 1939 to 1940 came principally from rural accidents. These rose about 9 per cent to a total of 20,700 while deaths from accidents in towns and cities went up only 3 per cent to 13,700.

Pedestrian deaths increased moderately—3 per cent, to a total of 12,600. Non-pedestrian fatalities totalled 21,800—up nearly 8 per cent from 1939. Children under 5 years of age were the only persons with a better motor vehicle death record in 1940 than in 1939. Deaths in this group numbered only 1100, compared to 1192 for the previous year, a decrease of 8 per cent. In contrast, deaths of school children, 5 to 14 years, rose 11 per cent, from 2339 to 2600. This is one of the few increases in school child death rates that have interrupted the general downward trend which started two decades ago. Deaths in the 15-24 age group went up 8 per cent from 6318 to 6800. In the 25-64 age group fatalities numbered 18,250, or 6 per cent more than in 1939. For persons 65 years or older the death total rose 6 per cent from 5328 to 5650.

**Public (not motor vehicle) Accidents.** There was no change from 1939 to 1940 in the number of deaths from public (not motor vehicle) accidents. In each year the fatality total amounted to 15,500. Since 1930, however, these deaths have decreased by 4500. The 1940 non-fatal injury total was approximately 1,850,000. Wage losses, and medical and insurance expenses amounted to about \$400,000,000.

Although the death total remained the same as in 1939 there were some changes in individual types of accidents in 1940. Outstanding in the year's record was the Natchez, Miss., dance hall conflagration in which 210 lives were lost. Air transport companies had three fatal accidents after having completed nearly 18 months of no-fatality operations. Thirty-five passengers were killed in these accidents, compared to a 1939 total of only 12 passenger deaths. Railroad passenger fatalities increased about 49, according to 11-month reports, but trespasser deaths decreased by 259. Fatal falls and deaths from excessive heat in public places increased.

**Home Accidents.** Deaths from home accidents rose from 32,000 in 1939 to 32,500 in 1940. In 1930 home accident deaths totalled only 30,000. Non-fatal injuries in 1940 numbered about 4,750,000. Wage losses, and medical and insurance costs amounted to approximately \$600,000,000. Little information is available on the trend of the different types of home accidents. However, it appears certain that deaths from excessive heat increased sharply due to the July heat wave. Available information indicates a small increase in deaths from burns, a slight decrease in fatal falls.

**Occupational Accidents.** The 1940 death total for occupational accidents was 17,000, an increase of about 10 per cent from the 1939 total of 15,500. However, the record is still favorable compared to the 1930 total of 19,000 deaths. There were approximately 1,400,000 non-fatal injuries in 1940. Total wage loss, and medical and insurance expenses amounted to about \$650,000,000.

Four coal mine disasters in Ohio, Pennsylvania, and West Virginia resulted in 257 deaths, or one-sixth of the total 1940 death increase. A New Jersey powder mill explosion killed 51 workers. The increase in occupational accidents was accompanied by greater employment. According to available data manufacturing employment increased 6 to 7 per cent over 1939, and total employment went up 3 to 4 per cent. However, accident rates based on man-hours worked, and covering both fatal and non-fatal injuries, were higher in 1940. Plant safety contest reports show an increase of 2 to 5 per cent in both the frequency rate (injuries per million man-hours) and the severity rate (days lost per thousand man-hours).

See AERONAUTICS; AUTOMOBILES under *Accidents*; INSURANCE under *Casualty Insurance*; LABOR CONDITIONS under *Health and Safety*; MINES, BUREAU OF; VITAL STATISTICS.

A. D. BATTEY.

**ACCOUNTS, Bureau of.** See FISCAL SERVICE.

**ADEN.** See under ARABIA.

**ADULT EDUCATION.** See AMERICAN FEDERATION OF LABOR; EDUCATION; EDUCATION, U.S. OFFICE OF; LIBRARY PROGRESS.

**ADVANCED STUDY, Institute for.** An institution of higher learning founded in 1930 by Mr. Louis Bamberger and Mrs. Felix Fuld. The Institute is different in character from any other American educational institution in that it is planned for students who wish to pursue advanced research beyond the level of the doctor's degree. It has no tuition fee, no routine requirements, no examinations, and awards no degrees. The work is largely individual, though there are seminars and courses of lectures in some subjects. Since the individuals who attend the Institute are in many cases extremely eminent in their subjects, the word "student" is not used, but they are rather designated as "members." The two groups, the faculty and members of the Institute, are in reality a body of scholars working together.

The Institute for Advanced Study is supported entirely by an endowment which amounts to just over \$8,000,000. In addition to the gifts made by the founders, the Rockefeller Foundation has contributed half the cost of the Gest Oriental Library, and the Carnegie Corporation and the Rockefeller Foundation have contributed funds which maintain a number of promising scholars. Located at Princeton, N.J., the Institute has no official connection with Princeton University, though there is a great deal of informal co-operation between the two institutions. In 1939-40 there were 46 members working at the Institute and 17 professors on the staff, in addition to the director, Frank Aydelotte. Abraham Flexner is Director Emeritus and Alanson B. Houghton is chairman of the Board of Trustees. Headquarters: Fuld Hall, Olden Lane, Princeton, N.J.

**ADVENT MOVEMENT.** A religious movement which originated in America with William Miller (1782-1849), who believed in the imminent, personal second coming of Christ. There are six

Adventist bodies in the United States, the largest being the Seventh-day Adventist Denomination, formally organized in 1860, which observes Saturday as the Sabbath of the Scriptures. Headquarters, Takoma Park, Washington, D.C. For statistics, see RELIGIOUS ORGANIZATIONS.

**ADVERTISING.** See FEDERAL TRADE COMMISSION; GARMENT INDUSTRY; NEWSPAPERS AND MAGAZINES.

**AEGEAN ISLANDS, Italian.** The islands in the Aegean sea, near Turkey in Asia, belonging to Italy. They comprise Rhodes, Castelrosso, and the Dodecanese group. Total area, 1035 square miles; total population (1936), 140,848 (natives, 85 per cent; Italians, 12 per cent). Chief towns, Rhodes (capital), 27,466 inhabitants (1936); Kalyrnos, 15,247. The chief agricultural products consist of grapes, olives, tobacco, oranges, and vegetables. Oriental carpets, wine, olive oil, pottery, and tiles are manufactured. Sponge fishing is an important industry. In 1938, imports were valued at 157,421,000 lire; exports, 21,851,000 lire. Budget (1934-35): 48,000,000 lire. The Italian navy has a station at Rhodes, and a base at Liros in the Dodecanese group. On September 4 a British Mediterranean squadron bombarded the Italian stronghold at Karpathos (Scarpanto) in the Dodecanese group. Numerous air attacks were made on the islands. Governor, Gen. Ettore Bastico who succeeded Count de Vecchi on Dec. 7, 1940. See EUROPEAN WAR.

**AERONAUTICS, Military Aviation.** The year of 1940 for all of its terrible demonstrations of the importance of air power in modern warfare still left a number of long-debated questions not yet finally decided. For example, despite some claims to the contrary, there was as yet no definite proof that an attacking aircraft or squadron of aircraft had been able to sink a first line battleship. There was also no complete proof that bombing attacks had been able completely to destroy the production capacity of a major industrial city or region. There was still no answer as to whether a nation could be driven to its knees solely or in large part through long-continued and heavy bombing attacks. Despite an overwhelming numerical supremacy, the German air force had not yet demonstrated that it was capable at will of securing air supremacy over its British opponent above any area where such supremacy was of vital importance. But if these general questions remained without definitive answer, the developments of the year (see EUROPEAN WAR) drove home with terrific emphasis other lessons in aerial tactics and strategy.

If the battleship versus bomber argument was not completely settled, it was nevertheless clear by the end of the year that attacking aircraft were capable of sinking or inflicting devastating damage upon all other categories of surface vessels when such surface vessels were in harbor or when such vessels were in the open sea and not otherwise protected by fog or night. Perhaps even more vital in the development of the war than the results of direct conflicts between bombers and naval vessels were the depredations wrought upon British commerce vessels by German aircraft operating above the sea lanes to England. Against such attack, even heavily escorted convoys have so far proven extremely vulnerable.

In the land campaigns of Western Europe, the events of the year once more emphasized the supreme importance of air mastery in the execution

of modern military campaigns. By establishing such clear supremacy, the Germans were able to drive home their victories in Norway, the Netherlands, Belgium, and France. By losing their supremacy temporarily, the Germans failed to prevent the rescue of the British Expeditionary Force at Dunkirk. On the other hand, the British, campaigning in Libya at the year's end, were tremendously aided in their land efforts by mastery over the locally effective Italian air squadrons.

As regards bombing of objectives of industrial or secondary military importance, the raids carried out during the last months of the year over England by the German air force, and over German-held territory by British airmen, seemed to indicate in general terms, (1) that mass daylight raids are extremely costly to the attacking air force, but that (2) night raids are almost impossible to stop completely through any defensive tactics so far developed.

Lessons learned in innumerable individual or squadron combats throughout the year reaffirmed once more the general importance of top speed, climbing speed, and maneuverability in the design of all types of military aircraft. New emphasis was placed upon the value of rapid-fire cannon in preference to machine-guns, or at least to machine-guns of the ordinary caliber, upon the desirability of furnishing at least light armor-plate protection for pilots, upon the value of mechanically operated gun-turrets; and upon the value of self-sealing fuel tanks. Ability to conduct operations at extremely high altitudes seemed to be emerging as a fundamental requirement for all types of bombing and fighter aircraft. See EUROPEAN WAR; MILITARY PROGRESS; NAVAL PROGRESS.

**World Air Transport.** A year during which the sound of an airplane overhead was a cause for alarm to a large portion of the earth's inhabitants would hardly seem one in which it would be logical to expect great activity in peaceful international air transportation. Yet, with the exception of Europe and Africa, international air transport either held its own or registered real progress during 1940. Even in Europe the war did not wholly stop international air traffic. German, Scandinavian, and Italian operators continued to fly routes which extended from Oslo to Luby, from Moscow to Lisbon. The British maintained connecting services with the Pan American Clipper service to Portugal and kept up at least skeleton services on its Empire routes south and east of Alexandria. The energetic Royal Netherlands Airlines, while barred of course from Europe, continued operations in the Netherlands East Indies and in the Caribbean.

In Asia the U S S R. continued development of its impressively long network of airlines connecting its component republics. Japan increased its services to the mainland. Even the China National Airways continued to operate schedules between Hong Kong and Chengtu via Chungking and from Chungking to Rangoon.

In the Western Hemisphere and across its two adjoining oceans, Pan American Airways effected improvements and extensions in its airline network which made 1940 one of the most constructive in its history. On August 4 a Pan American clipper completed the 200th crossing of North Atlantic route opened by that airline in the spring of 1939. Long before August however the clipper route had come to be accepted as the surest, safest, and certainly by far the quickest means of travel between

the United States and war-torn Europe. During its first 200 flights this service carried more than 2600 passengers and 300,000 lb. of mail. On July 12 another clipper inaugurated a service between San Francisco and Auckland, New Zealand, via Los Angeles, Hawaii, Canton Island, and New Caledonia. This new service to New Zealand was, of course, completely supplementary to the trans-Pacific service between San Francisco and Hong Kong which Pan American has conducted since 1935. Pan American also opened during the year a new year-round service between Seattle and Alaska and inaugurated a new high-speed service between Miami and Rio de Janeiro. The last service, which cuts the time of transit to three days, is carried on with big thirty-passenger Boeing-built four-engined "strato-clippers," designed to fly at extremely high altitudes without discomfort to passengers or crew, each ship being equipped to maintain a comparatively low-level pressure throughout its cabin by means of superchargers. The present service to Rio de Janeiro also is featured by the use of a new and shorter route to that city. Instead of following the long Brazilian coastline south from Belem, as Pan American coastwise clippers have done for a decade, the new planes now strike directly across the interior from Belem toward Rio de Janeiro, thus saving an almost exact 1000 miles. At the end of 1940 Pan American Airways were operating 69,464 miles of route through 53 countries or colonies, employed 6500 persons and had 144 aircraft in constant use.

See AUSTRALIA under *History* for crash killing Cabinet and military leaders.

**Domestic Air Transport.** During 1940 the sixteen operators of scheduled airlines within the continental boundaries of the United States once more adhered to the tradition of the industry by flying more miles, carrying more passengers, and handling more air mail and air express than in any preceding year. During the twelve months period the domestic operators flew an estimated 108,254,000 revenue airplane miles, an increase of 31 per cent over the corresponding figure for 1939; passenger traffic reached 1,054,393,000 revenue passenger-miles, an increase of 55 per cent over 1939 performance, express traffic gained 25 per cent over the previous year to a total of 6,826,150,000 pound-miles, and mail figures, not yet available, are known substantially to exceed the record set in 1939.

For the first time in the history of the American industry, national defense requirements raised serious problems for the air carriers. In former years the operators had always been able to count upon the nation's military or naval services for a constant supply of well-trained airmen. In 1940 this supply not only dried up, but younger airmen, still in the lower rungs of airline employment, were being attracted back to the services by the prospect of long terms of active duty. The procurement of flying equipment by the end of the year had also become difficult in the face of the national policy of allocating priority of deliveries to Great Britain or to our own military squadrons. While no final decision on airline deliveries had been reached by the year's end, it seemed unlikely that the airlines would receive more than a fraction of the new planes they had ordered in 1940 and which would be needed for continued expansion of services.

By no means for the first time, the air transport history of the past year in the United States demonstrated the inseparable relationship between air-

line safety and the acceptance of air transportation by the American public. On Mar. 26, 1939, an accident occurred on an airline operating out of Oklahoma City, Okla. Thereafter no accident fatal to any person in the air or on the ground was caused by domestic airline operation until Aug. 31, 1940. During those seventeen months indices of passenger traffic climbed at a rate which exceeded the most sanguine expectations. March is usually one of the leaner months in the airline traffic year. March, 1940, set a new all-time record for air travel, well above the best "good-weather" peak of 1939. Thereafter each succeeding month until September set another all-time record, August traffic being 66.69 per cent above the corresponding traffic for 1939. September traffic following the August 1940 accident showed a slight decrease from August. Apparently the first accident was not long in being forgotten, October witnessed another record. But then a second fatal accident occurred on November 4 followed on December 4 by still a third. In November traffic levels broke sharply. Preliminary reports on December show a continuing loss to a point where the airlines were carrying only 7 per cent more passenger traffic than in 1939 yet were flying approximately 19 per cent more airplane miles. The set back was nothing which a return to safety could not remedy but it caused the entire industry and the related governmental agencies the deepest concern.

The past year witnessed another substantial modification in the organization established by the U S government to control and develop the air transportation industry (and in fact all of American civil aviation). The Civil Aeronautics Act of 1938 (see 1938 YEAR BOOK, page 6) created an independent administrative agency, known as the Civil Aeronautics Authority. To the five members of this Authority were assigned full control of the economic affairs of interstate carriers, and the promulgation and enforcement of safety regulations for all civil flying. An official, known as the Administrator of the Authority, was charged with the responsibility of building, maintaining, and operating the system of emergency fields, beacon lights, and radio aids to navigation forming the Federal Airway System. Still another group of three officials was set up as an independent Air Safety Board within the Authority framework to investigate aircraft accidents and study safety measures. In April, 1940, President Roosevelt, exercising the powers granted him by the Reorganization Act, directed that the five-man authority should hereafter have control of economic matters, the promulgation of safety regulations (but not of their direct enforcement), and should assume responsibility for the work formerly conducted by the Air Safety Board. To the responsibilities of the Administrator were added the direction of all field inspections, all promotional functions, and control of the Civilian Pilot Training Program. The organization of the Administrator, now designated as the Civil Aeronautics Administration, was placed entirely within the Department of Commerce. The former five members of the Authority, now constituting the Civil Aeronautics Board, were left in a semi-independent status, dependent upon the Department of Commerce for such services as personnel, budgeting, and accounting. The reorganization was bitterly opposed by at least part of the aeronautical industry, and by many legislators. It was defeated in the House of Representatives but was finally approved by the Senate. Under terms of the Reorganization Act

the President's order thereby became law and the reorganization was made effective July 1.

**Private Owner Aviation.** Unrestricted flying by individual non-military pilots must perforce cease almost to exist in a nation engaged in modern warfare. Even when that nation is separated from the actual theater of war by thousands of miles of ocean—as, for example, Canada, Australia, and New Zealand were during 1940—all civilian aviation save scheduled airline transportation becomes quickly absorbed in the national military training programs. Privately owned planes are bought up or commandeered as trainers. Qualified pilots and mechanics are drawn into the military services or become instructors in military schools or in civilian schools now engaged entirely in the elementary instruction of military cadets. With the spread of war, it would be safe to say, private-owner aviation in its peacetime form became during 1940 almost non-existent throughout all the world save in the United States, its possessions, and Latin America. Even in the United States where this type of flying broke all previous statistical records, 1940 witnessed a marked shift toward an evaluation of its achievements and limitations almost entirely by the yardstick of military preparedness.

By any yardstick, the American achievement was spectacular. For several years preceding 1940, the number of individuals holding certificates of competency as pilots had been growing rapidly larger and planes registered by private owners had steadily increased. Production of aircraft for domestic civil use had been making gains reminiscent of the growth of automobile production figures thirty-five or forty years earlier. Yet all these once-exciting measures of progress were completely dwarfed in 1940. During the twelve months of that year, the number of certificated pilots increased from 31,264 to 65,000. The number of registered civil aircraft rose from 12,829 to 17,000. Aircraft production for domestic civil use reached 3715 during 1939, but last year it increased to more than 6750. Comparison of these figures with corresponding statistics for earlier years is shown in the accompanying table. The figures for 1940 are approximations based on very nearly completed surveys by the Civil Aeronautics Administration.

	1936	1937	1938	1939	1940
Civilian Pilot Certificates (As of December 31) . . . . .	15,952	17,681	22,983	31,264	65,000
Registered Civilian Aircraft (As of December 31) . . . . .	7,424	9,152	10,000	12,829	17,000
Aircraft Production for Domestic Civil Use (During year). . . . .	3,010	3,773	2,698	3,715	6,750

Much of this progress was obviously due to the Civilian Pilot Training Program directed by the Civil Aeronautics Authority and financed by the Federal government. But one must not lose sight of the fact that a substantial part was also due to the fact that Americans in increasing numbers are taking the time and trouble expending their own funds to qualify themselves as pilots. Except for the few hundred per year who found their way into civil flying from the military or naval services, all those qualifying prior to 1939 did so on this basis. During 1939 only a few hundred qualified for certificates after C.P.T.P. training, but during 1940 some 9000 of the approximate 34,000 increment in

certificated pilots was over and above the product of the Federally-subsidized program.

The Civilian Pilot Training Program, launched in 1939 (see 1939 YEAR BOOK, p. 6) underwent a swift acceleration during 1940 as it became apparent that the United States must make every possible move to increase its military assets. Initiated on an experimental basis during the spring of 1939 with an enrollment of 330 students at 13 colleges, the C.P.T.P. received \$4,000,000 from Congress for the fiscal year of 1941 and launched training units at more than 500 colleges and at 70 non-college communities. By July 1, 1940, a total of 8327 students had received approximately 38 hours each of flying instruction in light planes and had qualified for their Private Pilot Certificates.

As originally conceived, the program was first a means of stimulating through governmentally financed education a phase of aviation which held promise of someday becoming a major industry; only secondarily was the program considered a means of creating a partly trained military reserve. The events of the spring of 1939 reversed that emphasis. Congress increased appropriations for the program to \$36,000,000 for the fiscal year of 1942. A summer term of the program was launched and the primary training course of 35 hours was telescoped from two academic terms to one. A secondary training course of approximately 45 hours of advanced pilotage was set up to be conducted in somewhat larger airplanes. By the year's end instruction units were in operation at 703 colleges and 202 non-college centers. Some 2416 aircraft were in program use at 586 different airports. Training was proceeding at such a rate that between July 1, 1940, and July 1, 1941, no less than 45,000 trainees would receive their first 38 hours of preliminary training and an additional 30,000 pilots already holding at least a Private Pilot Certificate would receive some form of advanced instruction. Both the elementary and advanced flying instruction continued to be co-related with extensive ground school classes.

As America became more anxious over the state of its defenses, criticism was leveled at the military worth of the C.P.T.P. Even its immediate sponsors admitted that cadets fully enrolled in the military or naval air arm, flying comparatively larger training ships, and working under service instructors, were capable of more rapid and immediately useful training. As the army and navy swung additional training centers into action it was obvious that the C.P.T.P. might well decelerate its efforts and the Bureau of the Budget consequently recommended only \$18,000,000. But as a means of promoting the interest of college students and other persons in the same age group in flight training and as a training method which did not require the interruption of a college career, the program was still unchallenged. As of Dec. 1, 1940, some 2600 graduates of its courses had applied for enrollment in the air arms of the U.S. forces. Five hundred more were waiting to apply and more than 500 instructors who had received valuable experience and training in the C.P.T. program had been used in setting up army or navy flying schools.

Long range observers are already speculating on the possibility that the immense pilot training programs now in progress throughout the world will at the end of the present emergency result in the daily use of private-owner aircraft by some hundreds of thousands of people. Forecasting on such a subject at this time is hazardous to the extreme.

Terms of any possible peace agreement, the future economic situation of nations and continents, and other such unpredictable factors might well act against any such development. There is every reason to believe, however, that the availability of cheaper, more reliable, and more useful aircraft, the comparative thoroughness of training, and the permanently increased air-consciousness of the entire human race should all be factors in making possible a far greater boom in private owner flying after this conflict than after the World War of 1914-18.

**Airports.** The swift increase of all types of flying activity in the United States and the certainty that new military and civilian developments would increase such activity several-fold in the near future, focussed widespread attention upon America's airport problems. At more than 20 airports, traffic surveys showed more than 10,000 aircraft landings or aircraft take-offs occurring each week throughout the summer season. At almost 200 airports the intensification of civilian training and general flying activities created serious traffic problems for the operators of scheduled airlines who themselves were in the process of steadily increasing airplane movements. The establishment of primary Air Corps training centers at some 29 municipal airports, provisions for basing large military tactical units at some 40 other municipal airports, and the construction of a number of huge military flying areas in regions already in active use by civilian aircraft, brought about a nationwide need for airport construction over and above that directly executed by the Army and Navy or carried out as in preceding years by the Works Progress Administration.

As a result, Congress appropriated the sum of \$40,000,000 to implement the building, extension, or improvement of 200 airports under the immediate direction of the Administrator of Civil Aeronautics. While airport projects carried out under this program were subject to the preliminary approval "as necessary for national defense" of a Board consisting of the Secretary of War, the Secretary of the Navy, and the Secretary of Commerce, the airports selected were primarily civilian in nature. The completion of these projects during 1941 and 1942 was expected to be of real benefit in handling the nation's rapidly growing air traffic problem, but it was felt by many experts that the program would eventually have to be many times expanded to effect a really adequate solution. At the end of the year there were a total of 2331 recognized airports or landing fields throughout the United States; 788 of these were municipal; 496 commercial; 796 were designated as intermediate or auxiliary in character; 21 were owned and operated by the Navy, 69 by the Army, and 134 were privately owned. Of the total of 2331, some 776 were partially or fully lighted for night operations.

DANIEL SAYRE.

**AFGHANISTAN.** A kingdom in central Asia. Area, about 251,000 square miles; population, variously estimated at from 7,000,000 to 10,000,000. Estimated populations of the chief towns: Kabul (capital), 80,000; Kandahar, 60,000 (with suburbs); Herat, 50,000; Mazar-i-Sharif, 30,000. Persian, Pashto, and Turki are the principal languages and Mohammedanism is the chief religion. Schools in 1940 included 130 primary, 4 secondary,

13 military, 1 normal, 1 medical college, and a few technical, art and commercial schools.

**Defense.** One-eighth of the male population of each city and village must serve in the army for two years. There is also a regular army recruited by life-long enlistment. The normal peace strength of the army is 60,000 men, including the small air force of 100 men with some European-trained pilots. The number of men under arms in 1940 was reported at between 150,000 and 250,000. Numerous tribesmen armed with modern rifles are available for service in time of war.

**Production and Trade.** Agriculture and stock raising are the chief occupations, the main products being cereals, fruits, vegetables, cotton, wool, hides and skins, and meat from the native fat-tailed sheep. Iron, gold, and lapis lazuli are mined. Other rich mineral resources remain undeveloped. There are state-owned factories at Kabul, Kandahar and elsewhere for the manufacture of arms, ammunition, boots, military clothing, furniture, matches, buttons, leather, and wool products.

Trade is chiefly with India, the U.S.S.R., and Iran, the main exports being Persian lambskins, fruits, nuts, other hides and skins, and vegetables. The government has a monopoly of exports of lambskins and of imports of sugar, gasoline, motor vehicles and spare parts. The aggregate value of the transit and direct trade with India in the year ended Mar. 31, 1939, was 46,400,000 rupees (rupee averaged \$0.3328 in 1939, \$0.3659 in 1938). Camels and ponies remain the chief means of transportation, but some 4000 miles of roads are passable to motor traffic in dry weather. Construction of an all-weather highway that would reduce the travel time by motorcar from Kabul via Jalalabad to Peshawar, India, to seven hours was under way in 1940. There are no railways. The large towns have telephone communications.

**Government.** Revenues of the state are estimated at 150,000,000 Afghanis (4 Afghanis equal 1 Indian rupee) annually. The government is a constitutional monarchy, with legislative power vested in a parliament consisting of the King, a senate of 45 members appointed by the King for life, and a national assembly of 109 elected members. King Mohammed Zahir Shah succeeded to the throne Nov. 8, 1933, upon the assassination of his father, Mohammed Nadir Shah.

**History.** The danger of a Russian attack upon Afghanistan, that led the Kabul Government to order a precautionary mobilization in the autumn of 1939 (see 1939 YEAR BOOK, p. 11), continued to keep the Afghan people in uneasy suspense during 1940. During January and February further consultations were held among the governments of Afghanistan, Iran, Iraq, and Turkey to discuss joint measures of defense against Soviet and German threats. In February the Afghan Minister to Turkey was recalled to Kabul for military discussions. Kabul authorities continued to co-operate with British-Indian military officials in curbing the activities of the Fakir of Ipi and other rebellious leaders among the tribes of the Afghan-Indian border region. However German propaganda, carried on by agents in Afghanistan and by radio broadcasts in Afghan from Berlin, was reported in July to have produced a pro-German tendency among some Afghan leaders, including the King's uncle, Minister of War Sirdar Ahmed Shah Khan. Nazi agents were said to be conspiring to place Ahmed Shah on the throne.

Conclusion of an important trade pact with the

Soviet Union was announced in Kabul July 24. It was hailed in Moscow as an evidence of increased Soviet-Afghan collaboration. Afghanistan agreed to export 10,000 tons of wool, 75,000 caracul skins and 1000 tons of sesame to the Soviet Union in return for specified quantities of Soviet agricultural implements, sugar, benzine, kerosene, etc.

**AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA).** An agency in the U.S. Department of Agriculture operating programs that carry out the purposes of the Soil Conservation and Domestic Allotment Act, the Agricultural Adjustment Act of 1938, the Sugar Act of 1937, and related legislation

The programs are pointed toward maintaining the Ever-Normal Granary, by which producers and consumers are assured of abundant supplies and emergency reserves of farm products at fair prices; conserving the soil resources of the Nation's individual farms; and assisting farmers in obtaining a fair share of the national income

To accomplish these purposes, the AAA program provides the agricultural conservation program, under which payments are made to farmers for complying with acreage allotments of soil-depleting crops and for carrying out specific soil-improving practices; parity payments to supplement farm income when prices for basic farm products are low; marketing quotas to promote orderly marketing of excessive crop supplies; commodity loans; and crop insurance on wheat. Stored commodities serving as collateral for loans and wheat stocks paid as premiums for insurance make actual the Ever-Normal Granary principle

The use of marketing quotas is subject to a two-thirds approval of farmers voting in referendums, participation in the rest of the program is voluntary. It is estimated that more than 6 million farmers, operating over 80 per cent of the Nation's cropland, took part in 1940.

Under the sugar program, the Secretary of Agriculture is required to estimate annually the sugar needs of American consumers and to allot the estimated quantity among the various areas, domestic and foreign, supplying this market. It also provides for payments to domestic sugarcane and sugar beet producers who qualify under its provisions

Congress appropriated for 1940 conservation payments, \$438,560,000 plus not to exceed \$60,000,000 of the unexpended balance of the previous year's appropriation; for parity payments on cotton, wheat, corn, rice, and tobacco, \$225,000,000; and for payments to sugar growers, \$47,975,000. Legislation provides for increases in payments under \$200, the percentage increase being larger for the smaller payments.

Local committees, elected from among their own number by co-operating producers, are in charge of the field administration of all phases of the AAA program, including commodity loans and crop insurance, made available through the Com-

modity Credit Corporation and the Federal Crop Insurance Corporation, respectively. These committees operated in more than 3000 counties and 24,000 communities during 1940. In the light of national defense needs, precipitated by the war in Europe, this committee organization assumes added importance as a means of making immediately available to farmers expedient changes in the program.

The 1940 AAA goal for soil-depleting crops (such as corn, wheat, rice, cotton, tobacco, potatoes, and peanuts) was set at from 270 million to 285 million acres which, with normal yields, it was estimated would provide ample supplies for all domestic, export, and reserve requirements.

Soil-improving practices included seeding green manure and cover crops, legumes, and grasses; applying phosphate and other fertilizers; planting, maintaining, and improving forest trees; strip cropping; contour listing or furrowing; contour farming intertilled crops; terracing; natural re-seeding of pasture; and constructing dams and reservoirs.

Three marketing quotas for 1940 were proclaimed by the Secretary of Agriculture, and growers approved their use by the following percentages: Cotton, 91.2 per cent; flue-cured tobacco, 90 per cent; burley tobacco, 83.3 per cent. New legislation enabled growers of flue-cured tobacco to vote on the question of marketing quotas for a three-year period instead of for one year; on July 20, 1940, quotas for 1941-43 were approved by 86.1 per cent of the farmers voting. Later in the year, farmers voted to use marketing quotas for cotton for 1941-42 by a favorable vote of 92.3 per cent. Tobacco growers approved quotas for 1941-43 by the following percentages: Burley, 76.5 per cent, dark air-cured, 84.2 per cent, fire-cured, 86.3 per cent

Crop loans may be made on any agricultural commodity; loans are mandatory on cotton, corn, and wheat under specified conditions of supply or price. Loans in 1940 for basic crops were made at the following rates: Corn, 61 cents a bushel in the commercial corn area, cotton, a minimum of 8.51 cents per pound for Middling  $\frac{7}{8}$ -inch gross weight basis, wheat, an average of 64 cents a bushel; rye, a maximum of 38 cents a bushel; and barley, a maximum of 35 cents on the basis of farm storage.

R M EVANS

**AGRICULTURAL CHEMISTRY AND ENGINEERING, Bureau of.** This bureau, established in 1938 by order of the Secretary of Agriculture, supersedes two former bureaus. It has co-ordinated and continued scientific and technological research on agricultural products, formerly conducted by the Bureau of Chemistry and Soils, and some of the engineering research, formerly conducted by the Bureau of Agricultural Engineering. The new bureau was authorized by the Secretary to administer and operate the four regional research laboratories established by the Department, pursuant to provisions in the Agricultural Adjustment Act of 1938, to develop new uses and wider industrial outlets for farm products and by-products.

Construction and equipping of the regional laboratories were nearing completion at the end of June, 1940. Active research was expected to begin in at least three of the four laboratories early in 1941.

The Eastern Regional Laboratory for Research

on Utilization of Farm Products, at Wyndmoor, Pa., near Philadelphia, is concerned with promoting industrial utilization of tobacco, potatoes, apples, vegetables, tanning materials, hides and skins, animal fats and oils, and milk products; the Northern Laboratory at Peoria, Ill., is giving first attention to corn, wheat, and agricultural residues; the Southern Laboratory at New Orleans, to cotton, sweet potatoes, and peanuts; and the Western Laboratory at Albany, Calif., near San Francisco, to western fruits and vegetables, potatoes, wheat, alfalfa, and poultry products and byproducts.

New fruit products developed in collaborative work include frozen apple slices for pies, frozen fruit purees for ice cream and sherbets, dehydrated sugared strawberries, clarified strawberry juice, butter and candied pomace from strawberry pulp, fresh prune beverage, fruit-and-milk beverages and improved packed juices of several fruits.

Hesperidin, the glucoside in orange peel, was found to be non-toxic. Cadmium compounds were found to have a toxic effect like that of fluorine compounds; both produce mottling of teeth and inhibit the action of the enzyme phosphatase.

The principal allergenic constituent of cottonseed was isolated and characterized as a protein-like compound not conforming to any type in existing classifications. The name "Natural proteose" was suggested.

Improved mechanical equipment was designed for use after a mild chemical treatment for removing most of the water from sweet potatoes before drying with hot air. Dried sweet potato meal was found to be a good source of carbohydrate for balancing cottonseed meal in feeding cattle.

As high as 99.5 per cent of the oil in ground tung nut kernels was extracted by solvent alone, without regrounding.

An application was filed for a public service patent on a process for making plastics from hemicelluloses and phenols; patents were procured on processes for preparing a plastic from lignin and alkyl resins from lactic acid.

Rosin soap solutions were found to be more active as germicides against *Staphylococcus aureus* than were solutions of soaps made from natural fats and oils.

A formerly unknown biological activity of bacteria, the production of 2-ketogluconic acid, was discovered; the bacterium was isolated.

In studies on farm structures, it was found that grass silage exerts greater pressure on silo walls than does corn silage, that low temperatures help to preserve wheat in storage, and that wind-pressure ventilators on grain bins reduce moisture content.

HENRY G. KNIGHT

**AGRICULTURAL MARKETING SERVICE.** The Agricultural Marketing Service, established July, 1939, as an agency of the U.S. Department of Agriculture, continued to emphasize marketing service and regulatory work during the 1940 fiscal year. Approximately 300 co-operative agreements were in effect with State Departments of agriculture, State agricultural colleges, and other agencies.

**Agricultural Statistics.** In the issuance of statistical reports, over 9 million questionnaires of various types were mailed to 800,000 voluntary reporters during the year, and the information furnished became the basis for over 5000 separate reports that were mailed to almost 11 million indi-

viduals. The reports issued contained information on the acreage, yield, production, farm utilization, and sales of more than 100 crops; on numbers of livestock on farms; on milk and egg production and consumption; on prices paid and received by farmers; on wages of farm labor and on the number of farm workers employed; on the rail, express, boat, and truck movement of farm commodities; on the utilization and stocks of most major farm products, and on cotton by grade and staple lengths. Research went forward on acreage estimates, soil moisture, crop-weather relationships, farm labor, and farm-product prices.

**Market News.** Information on the movement, supplies, quality, and prices of all major farm commodities was obtained at terminal markets, shipping points, and producing sections and was rapidly and widely disseminated to markets throughout the country by means of an extensive leased wire system. The market news was further distributed through trade and farm publications and by commercial and financial institutions. A new high record was set in 1940 with 400 radio stations regularly broadcasting market news one or more times daily.

Special emphasis was placed on the dissemination of fruit and vegetable market news in 1940. A broadcast from New York City, going on the air at 6:30 each weekday morning, was very helpful to nearby growers who sell to farm-to-farm buyers. Consumer broadcasts developed during the year stressed the products in heavy supply or new products on the market. Such broadcasts were prepared by market news offices in several cities, including Cincinnati, Boston, Cleveland, and Kansas City.

A new livestock market news office was opened at Peoria, Ill. The coverage of tobacco markets was greatly improved; and it is thought that more farmers received usable price quotations on cotton in 1940 than ever before in the history of the cotton industry.

**Standards for Quality of Farm Products.** Standards of quality were already established for grain, cotton, tobacco, livestock, meats, 57 of the fruits and vegetables, and for most of the other farm products. During 1940, additional quality standards were developed for shelled and unshelled walnuts, sweet cherries for sulphur brining, pears, canned blackberries, canned freestone peaches, canned red raspberries, dried prunes, and frozen lima beans. Grades were revised for canned apples, asparagus, beets, carrots, red sour pitted cherries, sweet cherries, grapefruit juice, yellow clingstone peaches, pears, and plums.

Official standards for soybeans became effective under the U.S. Grain Standards Act, Nov. 20, 1940. Also, rather drastic changes were made in the standards for American-Egyptian cotton because the old standards had been rendered obsolete by the production of a new variety and by other changes in the crop. Revised standards for wool top, which became effective Jan. 1, 1940, include 13 grades, 8 of which are on a specification basis.

Almost 56,000 farmers and farm boys were reached through demonstrations, meetings, and farm visits, aimed at showing proper methods of preparing tobacco for market. Short courses on tobacco grades were held at seven agricultural colleges. Officials of the Service demonstrated the application of the official grain standards and discussed grain quality at 154 meetings in 23 States. Approximately 8500 grain producers, grain deal-

ers, county agricultural agents, and high school agricultural teachers attended these meetings. It is estimated that 25,000 people attended livestock grading demonstrations in 1940.

**Inspection, Classification, and Grading.** The services of Federal or Federal-State inspectors, classers, or graders were available for most standardized farm products in the principal producing areas, receiving centers, or in other convenient localities.

One of the most significant developments in this line of work during the past three years has been the free classification and market news services for members of cotton improvement groups. During the first season the plan was in operation—in 1938—18,589 grower members of 311 improvement groups became eligible for the services. For the current 1940-41 season, the number of approved groups exceeds 1570, with a membership of over 128,000 and a combined acreage of 4,108,500. By late December, 1940, samples representing nearly 1,500,000 bales had been classed for eligible growers. The class on any of these bales is acceptable for Government loan purposes.

Material expansion was made in work under the Tobacco Inspection Act. Seven additional markets were designated for free and mandatory inspection, and the inspections increased from 255,231,000 lb. during the 1939 fiscal year to 489,310,000 lb. the past year.

Inauguration of the "continuous inspection service" on canned fruits and vegetables blazed a new trail in grade labeling. Under this service, such lots as are sold by the canner for labeling in terms of the United States grades bear the grade statement incorporated in the shield insignia authorized for that purpose. The new service is on an experimental basis at the present time. Only canned products packed under the continuous observation of trained inspectors can carry the prefix "U.S." in connection with the grade designation. When the grade is indicated on the label, such as "U.S. Grade A (Fancy)," it is accompanied by the statement, "This product was packed under the continuous inspection of the Agricultural Marketing Service, U.S. Department of Agriculture, and the above grade officially certified."

Other commodities whose quality can be readily identified by the individual homemaker under certain conditions because of the device, or stamp, or certificate, or other visual indication of grade include beef, veal, lamb, poultry, eggs, butter, cheese, rice, honey, and certain fresh, canned and frozen fruits and vegetables.

During the 1940 fiscal year, 463,886 cars or carlot equivalents of fresh fruits and vegetables were inspected at shipping points and 47,256 cars were inspected at receiving markets. Approximately 642 million pounds of meat and meat products were graded, of which about 547 million pounds were beef. The quantity of dressed poultry inspected for condition and wholesomeness at plants where full-drawn poultry is prepared increased by half, and the volume of turkeys graded about doubled. The Federal-State egg-grading program was further extended, notably in Michigan and Virginia. A total of 1,174,933 inspections of grain were made, covering 1,877,000,000 bu.

**Regulatory Work.** In its service and regulatory work, the Agricultural Marketing Service administered 20 specific Acts of Congress in addition to the authority granted by the annual appropriation act. Administration of the Insecticide Act

and the Naval Stores Act was transferred to the Agricultural Marketing Service from the Food and Drug Administration in July, 1940. The Federal Seed Act, passed by Congress during the year, became effective for imported seed and agricultural seed in interstate commerce on Feb. 5, 1940, and for vegetable seed in interstate commerce on Aug. 9, 1940. The Service co-operated with State agencies and members of the seed industry in the framing of a uniform State seed law aimed at facilitating the enforcement of the Federal Seed Act.

At the end of the 1940 fiscal year, 20,750 licenses were in effect under the Perishable Agricultural Commodities Act, a statute that makes nine practices unlawful in the interstate marketing of fruits and vegetables. During the year 2168 complaints were filed. Informal amicable settlements were effected in 782 cases involving payments of \$277,000; and 203 formal orders of the Secretary were issued, of which 165 awarded reparations totaling \$72,000. One license was revoked; 5 licenses were conditionally suspended; and 36 licenses were automatically suspended by operation of the Act through failure to pay reparations as ordered.

In the enforcement of the two Standard Container Acts in 1940, 123 manufacturers were involved in 166 instances of technical violation, 91 of which had been corrected when the year closed. Enforcement of these statutes involved the removal of 232,763 non-standard containers from the channels of the fruit and vegetable trade.

Approximately 200 posted stockyards operated under the Packers and Stockyards Act in 1940. Sixteen poultry markets were designated under the Act, and there were 1781 licenses in effect. The capacity of licensed warehouse space set a new record with facilities for 10,048,500 bales of cotton and 187,745,000 bu. of grain.

**Marketing Research.** Various fields of marketing were explored in 1940 to learn more about the special problems that complicate the distribution of farm products.

Cotton mill requirements and preferences were analyzed, and the first full year of research in cotton packaging was completed. An analysis of gin packaging, transportation, storing, and handling of bales in marketing channels indicated that a 500-lb. bale with a density of about 25 lb. has advantages over other bales in commercial channels. Work is in progress on the development of a mechanical device for automatically sampling cotton at the gin. Spinning tests have thrown light on the utility of new cotton varieties.

Research in wool shrinkage went ahead in 1940 in an effort to develop a reliable method for ascertaining the clean-wool content of grease wool before either the entire clip or a large sample has been scoured.

To an increasing extent, the Service was endeavoring to bring about more efficient operation of receiving markets. During 1940, a survey of New York City's wholesale fruit and vegetable markets was made in co-operation with the Bureau of Agricultural Economics. The study showed that a new market to replace outmoded facilities would save growers, distributors, and consumers large sums of money every year.

CLARENCE W. KITCHEN.

**AGRICULTURE.** Agriculture in the United States in 1940 was co-operating to the fullest extent in the defense program, although faced with

new difficulties caused by the war. The farming industry, through State, Federal, and local co-operation, was maintaining its output for all requirements, adjusting the crops to changing demands, conserving soil, and mobilizing human and material resources for the general welfare. The cash farm income including Government payments was more than \$452,000,000 above that of 1939 and the second largest since 1929. Crop production, on fewer acres but responding with high yields per acre to a generally favorable season, improved practices, and light losses from pests, was larger than in any recent year except 1937, and was well distributed with few bumper crops. Supplies of foods, feeds, and fibers were enough for current needs plus carryovers. Prices received by farmers were tending to rise, although part of the increase might be offset by higher production costs. Important trends during the year included a slight gain in values of farm real estate; a decline in volume of farm-mortgage debt to the lowest level in 22 years—but with increased financing through the Farm Credit Administration; adequate credit on increasingly favorable terms; a gain in volume of short-term loans; the largest farm population since the record of 1916; increased expenditures for farm machinery; higher costs for building materials and certain other supplies; and rising wages for farm labor. Agricultural exports had shrunk and continued to decline as continental European markets were cut off by war blockades, whereas domestic markets had expanded and increase in demand in 1941 was prospective. Substantial gains were registered for both competing and complementary agricultural imports.

Major problems of agriculture were being attacked by the agricultural adjustment program with its provisions for soil conservation, for benefit payments to farmers, and for commodity loans and storage in the ever-normal granary; crop insurance; land-use reorganization efforts; surplus storage and disposal plans; systems of marketing quotas and agreements; efforts directed at expanding of domestic and foreign markets for farm commodities; farm credit on easy terms; rural electrification; and by research of the State experiment stations and bureaus of the U.S. Department of Agriculture, and the activities of the extension services. Definite efforts were being made to distribute the beneficial effects and to cushion or minimize possible adverse effects of important technological developments during the last 20 years in the production and distribution of farm products. Aids for needy farmers comprised the rehabilitation of low-income families through loans and guidance; improvement of tenure; debt adjustments and live-at-home efforts; community and co-operative services including medical care; emergency grants in drought and flood areas; work grants to the destitute; the tenant farm purchase program; several types of homestead projects; and camps for migrant farm labor. A number of these and other significant trends and problems of the farming industry are elaborated in the following pages. (See also sections on *Agriculture* under the States; sections on *Production* under foreign countries; separate articles on leading crops, as CORN, COTTON, TOBACCO, WHEAT; CO-OPERATIVE MOVEMENT; DAIRYING; ENTOMOLOGY, ECONOMIC; FARM MACHINERY AND EQUIPMENT; FERTILIZERS; FORESTRY; HORTICULTURE; LIVESTOCK; METEOROLOGY; POULTRY. For government activities in the field of agriculture, see the agencies listed under AGRICUL-

TURE, U.S. DEPARTMENT OF, and UNITED STATES under *Legislation*.)

**Agricultural Situation. Farm Income.** The cash farm income for 1940 was estimated by the U.S. Department of Agriculture at about \$9,119,903,000 (1939, \$8,668,434,000), which would include \$8,354,104,000 (1939, \$7,861,369,000) from marketings and commodities placed under loan and \$765,799,000 (1939, \$807,065,000) government payments. A gross farm income of about \$10,469,903,000 (1939, \$9,897,434,000) was indicated when the farm value of products retained for home consumption \$1,250,000,000 (1939, \$1,229,000,000) was considered. The cash income from all crops \$3,535,712,000 (1939, \$3,371,701,000) included grains \$1,018,150,000 (1939, \$913,787,000); cotton and cottonseed \$659,835,000 (1939, \$628,575,000); tobacco \$240,639,000 (1939, \$268,597,000); vegetables \$624,422,000 (1939, \$588,168,000); and fruits and nuts \$441,237,000 (1939, \$445,043,000); and from all livestock and livestock products \$4,818,392,000 (1939, \$4,489,668,000) including meat animals \$2,427,181,000 (1939, \$2,276,076,000); dairy products \$1,501,126,000 (1939, \$1,355,067,000); poultry and eggs \$727,732,000 (1939, \$718,215,000); and wool \$109,339,000 (1939, \$84,324,000). Cash income from farm marketings averaged \$1370 per farm and government payments \$126 per farm in 1940. The largest increases in cash farm income from 1939 to 1940 were in the hard spring wheat area and in the Corn Belt, where above-average yields of crops were accompanied by increased income from livestock and livestock products. The declines in income were in those southeastern States where production of cotton or tobacco was reduced sharply in 1940 and in Florida, where a severe freeze reduced sales of crops and fruits.

**Farm Real Estate.** Values of farm real estate during the year ended Mar. 1, 1940, rose one point reaching an index of average values per acre of 85 per cent of the 1912-14 level compared with 84 in 1939 and 85 in 1937 and 1938, and yet about 15 per cent above the 1933 low of 73. The increase during the year reflected in part an increase in prices of farm products and the generally higher level of farm cash income in 1939. The average per-acre value continued upward in all groups of States, except the West North Central region, which showed a 1 per cent decline to 67 per cent in 1940. The largest average gains were in the East South Central group, 3 per cent to 112, and West South Central, 2 per cent to 99. Farm real estate holdings by leading groups of lending agencies were reported to total \$1,012,963,000 as of Jan. 1, 1940, slightly below holdings on Jan. 1, 1939, and largest holdings were by life insurance companies, amounting to \$700,530,000. The number of farms in the United States on Apr. 1, 1940, as reported by the U.S. Bureau of the Census totaled 6,096,789 (1930, 6,288,648); land acreage in farms, 1,060,507,355 acres (1930, 986,771,016 acres); and the valuation of land and buildings \$33,644,263,247 (1930, \$47,879,838,358). The frequency of distress transfers of farm real estate, 1936-39, resulting from mortgage debt difficulties was found by the U.S. Department of Agriculture to have declined to new low levels, while the frequency of voluntary sales was at higher levels than those prevailing in the 1926-30 period. Farmer bankruptcies were reported in 1940 to have totaled 1422 during the year ended June 30, 1939, 3.2 per cent of all bankruptcies, as compared with 1799 in 1938, 2479 in 1937, and 5917 in 1933.

**Taxes.** Taxes on farm real estate in 1939, according to the U.S. Department of Agriculture, rose about 2 per cent over taxes levied in 1938, the fourth time in 5 years that for the country as a whole small increases had appeared. The index of taxes per acre for the United States on a 1909-13 base stood at 190 in 1939 compared with 186 in 1938, 178 in 1934, 281 in 1929, and 244 in 1920. Taxes per \$100 of farm real estate value averaged \$1.16 in both 1938 and 1939 compared with \$1.13 in 1936, the lowest since 1926. For most States, changes in taxes per acre between 1938 and 1939 again were very small, and few of the fluctuations in the State series could be attributed to important changes in property-tax laws, as in some recent years. Current information was that little change in the average levies on farm real estate would be expected between 1939 and 1940.

**Farm Credit.** That a somewhat larger volume of credit was used by farmers in 1940 than in 1939 was reported by the U.S. Department of Agriculture. There was an increase in the volume of loans made by agencies supervised by the Farm Credit Administration, and interest on all types of loans through this administration continued at low levels. Debt secured by liens on farm real estate in the United States on Jan. 1, 1940, was estimated by the U.S. Department of Agriculture at \$6,909,799,000, the smallest amount outstanding at any time since 1919, 2.3 per cent below the \$7,070,896,000 on Jan. 1, 1939, and about 64 per cent of the peak of \$10,786,000,000 on Jan. 1, 1923. Declines in farm-mortgage debt during 1939 were the most marked in the West North Central States and increases were most evident in the New England and East South Central regions. Factors contributing to further decline in debt included principal repayments consequent upon the better income position of farmers, lower interest rates and, to a decreasing extent, foreclosures and other forced sales. Factors making for increase in debt showed little change as compared with previous years.

The total amount of farm mortgage loans made in the 1940 fiscal year was slightly larger than in 1939 and the Federal land banks, the insurance companies, and commercial banks were more active in this field than individual creditors. Farm mortgage debt outstanding in 1940 held by Federal Land Banks and Land Bank Commissioner totaled \$2,525,714,000 (Oct. 1, 1940); by life insurance companies (Jan. 1, 1940) \$883,414,000; commercial banks \$543,341,000 (July 1); joint stock land banks \$51,722,000 (October 1) and Farm Security Administration tenant purchase and development \$60,836,000, and farmstead improvement construction \$7,269,000 (October 1).

The volume of personal and collateral loans to farmers held by commercial banks tended to follow the movement of farm-commodity prices, although loans lagged behind prices. Loans by Federal agencies, similar in character to such personal and collateral loans had not increased substantially since 1934, while a large increase had taken place, however, in emergency crop and feed, rehabilitation, and commodity stabilization loans. Short term loans to farmers held by selected lending agencies comprised those by commercial banks \$1,183,846,000 (July 1) in 1940 versus \$1,193,466,000 in 1939; and Federal agencies (October 1), including intermediate credit banks, \$40,902,000 versus \$37,645,000; production credit associations \$194,558,000 versus \$174,032,000; regional agricultural credit corporations \$7,010,000 versus \$9,127,000; emer-

gency crop loans \$126,522,000 versus \$122,163,000; drought relief loans \$51,384,000 versus \$53,504,000; Farm Security Administration \$319,997,000 versus \$280,271,000; and Commodity Credit Corporation \$274,726,000 versus \$191,379,000. See also FARM CREDIT ADMINISTRATION; FARM SECURITY ADMINISTRATION; AGRICULTURAL ADJUSTMENT ADMINISTRATION; COMMODITY CREDIT CORPORATION; ELECTRIC LIGHT AND POWER.

**Prices.** Local market prices of agricultural commodities averaged 98 per cent of the August, 1909-July, 1914 (prewar), average during 1940 versus 93 in 1939. Although holding most of the gains made in September, 1939, when prices increased sharply with the outbreak of hostilities in Europe, the price index for all farm products declined from 101 in February to a low point for the year of 95 in June and July. From then on, it rose steadily and ended the year at 101 per cent. Prices received by farmers during 1940 averaged higher than in 1939 for all groups of commodities, except meat animals. Compared with 1939, truck crop prices averaged 14 points higher; grains 13; dairy products 9 points; cotton and cottonseed prices 8; and fruit, chickens, and eggs each 2 points higher, while meat animal prices at 108 per cent of the prewar level were 3 points lower.

The average prices received by producers Dec 15, 1940, based on reports to the U.S. Department of Agriculture, with preliminary seasonal average prices for crops in parentheses, were estimated for wheat 71.5 cents (67.0) per bu., corn 54.5 (62.4), oats 32.3 (29.1), barley 41.6 (38.7), rye 41.3 (40.6), flaxseed \$1.41 (\$1.341), soybeans 81 (75.8), rice (rough) 76.3 (70.2), potatoes 54.9 (56.4), sweet potatoes 80.1 (84.4), apples 86 (80.7) cents per bu., tobacco 15.0 (16.5), cotton 9.33 (9.40) cents per lb., and cottonseed \$24.08 (\$21.48) and hay \$7.53 per ton. Beef cattle sold for \$7.56 per 100 lb., hogs for \$5.59, veal calves \$9.01, lambs \$7.88 and sheep \$3.99. Eggs brought 26.8 cents per dozen, butter 30.5 cents per lb., and whole milk whole-saled at \$2.07 per 100 lb. Wool sold for 31.2 cents per lb. and live chickens 13.0 cents. Milk cows brought \$63.10 each, horses \$69.10, and mules \$87.30. The corn-hog ratio (number of bu. equal in value to 100 lb. of hogs) was 10.3 versus 10 in December, 1939, and 11.9 the 1909-14 average. The ratio of prices received to prices paid by farmers rose from 79 in December, 1939, to 83 in December, 1940.

**Foreign Trade in Farm Products.** The agricultural foreign trade of the United States during the year ended June 30, 1940, as viewed by the U.S. Department of Agriculture was featured by cross currents. For exports, excluding cotton, there was a decline in value of 22 per cent, while cotton exports, responding to extraordinary circumstances, nearly doubled their value had in 1938-39. The gain in cotton raised the total value of all agricultural exports 8 per cent above 1938-39. Considering imports, the 1939-40 trade in products similar in type to those produced in the United States was 17 per cent larger than in 1938-39, and as a consequence, the ratio of farm imports to farm exports rose. Imports of complementary (noncompetitive) items rose 30 per cent. The European War and measures taken to prepare for it were major factors influencing international trade in 1939-40 and other recent years. To place their national economies on a war basis, a number of foreign governments restricted imports or bought them from sources expected to be accessible in wartimes,

which curtailed trade, and created war industries requiring large supplies of imported raw materials, which in general expanded trade. United States agricultural exports were influenced primarily by the restrictive measures. Imports were affected to the extent that American industry responded to war stimuli supplied either by domestic policy or by foreign-buying programs.

The exports of farm products from the United States, exclusive of forest products, rose in value to \$739,571,000 during 1939-40, as compared with \$682,962,000 during 1938-39. As a result of trade-restrictive effects of the war, agricultural products formed a smaller proportion of total United States exports than ever before in history, 20 per cent compared to 24 in 1938-39. The indexes of quantity indicated that all major groups of these exports, except cotton and linters and lard were lower for 1939-40 than for 1938-39. Cotton exports were \$169,936,000 higher in value than in 1938-39 while exports of other agricultural products declined \$111,327,000. There was a decline of \$58,247,000 in grain and grain products, \$79,204,000 in tobacco, \$27,886,000 in fruits, and smaller declines in feed and fodder and pork and lard exports. Gains were made in certain other agricultural products especially soybeans and fresh pork. The volume index was 72 per cent of prewar, compared with 63 in 1938-39; 79 in 1937-38, 56 in 1936-37; 83 per cent in 1933-34; and with 136 in 1926-27. Exports of farm products continued to decrease during the latter months of calendar 1940 largely because of progressive closure of foreign markets due to the spread of the European War and various trade controls. Total exports of farm products were not likely to show any substantial improvement as long as the war continued.

Imports of farm products into the United States during 1939-40 were valued at \$1,239,389,000, an advance of 24 per cent from 1938-39, which totaled \$998,648,000 and compared with \$1,155,136,000 in 1937-38, \$1,536,695,000 in 1935-36, and \$614,000,000 in 1932-33, the low point of the depression. The supplementary agricultural imports in 1939-40, \$571,346,000, were about \$85,181,000 more than in 1938-39, a 17 per cent rise expected in view of the improvement in domestic economic activity. This 17 per cent rise included increases of \$29,000,000 in imports of sugar, \$22,000,000 in imports of wool for clothing and other uses except carpets, \$7,000,000 in hides and skins, \$6,000,000 in feeds, and \$6,000,000 in vegetable oils. Imports of pork decreased by \$9,000,000 and of flaxseed by \$5,000,000. The complementary group of agricultural imports, consisting largely (about 95 per cent) of rubber, coffee, silk, coarse wool for carpets, bananas, cocoa, tea, and spices, during 1939-40 were 30 per cent above the level of 1938-39. The principal increases were in rubber and silk. Agricultural imports made up about 50.6 per cent of all imports, \$571,346,000 being supplementary (competitive) items, and \$668,043,000 non-competitive. Consult TRADE, FOREIGN. Aspects of and factors involved in foreign trade in farm products were discussed in the *Report of the Secretary of Agriculture for 1940*, pp. 1-8, 14-16, 21-27, 31-34, 114-132 and in *Foreign Crops and Markets* 41 (1940) pp. 296-328 (Sept. 5, 1940), pp. 926-956 (Dec 18, 1940), all U.S. Department of Agriculture.

**Population.** The farm population in the United States, estimated by the U.S. Department of Agriculture to total 32,245,000 on Jan. 1, 1940, compared with 32,059,000 a year before, was the larg-

est since the record of 32,530,000 in 1916. Movement to farms totaled 805,000 and to cities 1,063,000, but the net loss by migration 258,000 was more than offset by the surplus of births over deaths. Largest increases in farm population in the last decade were in the Southeastern and Pacific Coast States and decreases were noted in areas most severely affected by drought, especially in the West North Central States.

**Outlook.** The outlook for 1941 as observed late in 1940 included prospects for continued improvement in the domestic demand for farm products, smaller agricultural exports, a higher general average of prices, and larger total cash income from marketings. Features of the agricultural situation in 1940 and indicated developments in production and marketing in 1941, concerned with domestic and export demand for farm products, prices and income, farm credit and labor, equipment and fertilizer, farm family living, and the status and future of field crops, fruits, truck crops, nuts, livestock, poultry and their products, prepared by the U.S. Department of Agriculture, co-operating with State agencies, were published in a number of special articles and in *Agricultural Outlook Charts Books for 1941*, and *The Agricultural Situation* (1940), monthly, (all U.S. Department of Agriculture).

**Crop Production in 1940.** The harvest of farm crops in 1940 was featured by high yields per acre and the total crop production, on a smaller acreage, was larger than in any year except 1937. Unlike the huge crops of that year, which came when reserves were greatly depleted, the U.S. Department of Agriculture points out, crops of 1940 were harvested after three good years so supplies of some products were much higher than indicated by production figures alone. The production of the principal field crops in 1940 was 104.5 per cent of the pre-drought (1923-32) level compared with 99.8 in 1939 and 109.9 in 1937. Fruit production was 33 per cent above pre-drought, and commercial vegetables 43 per cent above, and production of all these crops in 1940 was 107.9 per cent of the base average, exceeded only in 1937. Production was well distributed, with only a few bumper crops. The total production of bread and feed grains was about the average for the last three years; flaxseed made almost the largest crop on record; cotton exceeded the crops of 1936, 1938, and 1939, but was only two-thirds that of 1937; tobacco was about average; crops of hay and forage and hay seeds were larger; and sugar beets made a record. The favorable showing of individual crop yields in 1940 compared with several years ago was not accompanied by correspondingly heavy production because of the smaller acreages and the smaller proportion of crop land devoted to more intensively cultivated high-value crops. The total acreage of all (46) crops harvested, 333,825,000, was about 8,000,000 acres above the low area of 325,845,000 acres in 1939 and compared with a 1929-38 average of 340,138,000 acres.

Composited acre yields of field and fruit crops were 118.5 per cent of the "pre-drought" average, compared with previous high records of 117.7 in 1937 and between 113 and 114 in 1938 and 1939. Practically all of the principal or million-acre crops, except grain sorghums, yielded better than in either 1929-38 or the ten years before the 1933 drought. In parts of the central and eastern Gulf States, growing conditions were generally unfavorable and several crops grown extensively as sugar

cane, sweet potatoes, sorgo for sirup, cowpeas, and velvet beans showed below-average yields. Tobacco, peanuts, and sugar beets made record yields per acre and cotton, potatoes, oats, and flaxseed were much above average. The good yields of 1940, like those of 1937 to 1939, were due in part to favorable weather conditions and such related factors as relatively light losses from insects and diseases. In 1940, weather particularly favored cotton and potatoes, appeared primarily responsible for good yields of tame hay, oats, spring wheat, and flax, but was much less favorable for corn than in the three preceding years, yet better than average. Winter wheat suffered severely from drought in the fall of 1939, but the acreage surviving was helped greatly by favorable growing conditions. Other facts conducive to good yields in the last

three years included more people on the farms and fewer acres to handle with resultant better care, use of more fertilizer and lime, diversion of low yielding crop land to pasture, improved farming practices under the Agricultural Conservation Program, and better varieties of the crops being planted. The acreage and production of farm crops in the United States, as estimated by the U.S. Department of Agriculture, and yields for cereals in foreign countries, as reported by the International Institute of Agriculture and other agencies are shown in the accompanying crop production tables and in the articles on individual crops; as, CORN, WHEAT, ETC.

**Experiment Stations and Extension.** Research and extension services continued to be potent factors in the American farming industry. Many new and significant contributions to the improvement of agriculture and rural life resulted during 1940 from the research of the State agricultural experiment stations, usually located at the agricultural college in each State and territory. The current trend of investigation had been directed to meet local and national long-time as well as present needs for greater agricultural stability and permanency, and to promote highest standards of living and health. The more than 8500 active research projects of the stations, many co-operative with other stations and the U.S. Department of Agriculture and financed from Federal and State funds, were concerned with the improvement, production, marketing, and utilization of field crops, vegetables and fruits, and farm animals and their products; protection against diseases and insects, development of effective cultural and field methods and harvesting and storage practices; soils and plant foods; improvement in farm machinery, soil conservation, irrigation, farm structures, and electrification; research relating to foods and human nutrition, textiles and clothing, and the management and equipment of the household; and rural social science investigation on agricultural planning and land use, production costs, farm income and real estate, taxation and credit, population movement, rural welfare and rural-urban relations, and social groups. The results of the broad program of research were being published in numerous bulletins, reports, and journals of the stations or those of the Department and in a wide range of technical journals. A comprehensive review of recent results, with appropriate statistical data, is included in *Report on the Agricultural Experiment Stations, 1940* (U.S. Dept. Agr.). Federal grants provided \$6,848,750 and State and other supplementary sources \$14,391,546, making a total of \$21,240,296 for the administration and research of the stations for the fiscal year 1940.

Work and accomplishments of nine special research laboratories, established 1935-39 under provisions of the Bankhead-Jones Act of June 29, 1935, and co-operative among Departmental bureaus and State stations and supplementing their research, were set forth in *Report of the Chief of the Office of Experiment Stations, 1940* (U.S. Dept. Agr.). Each dealing with a research problem of significance in the region served, these include laboratories for improvement through breeding of vegetables (Charleston, S.C.), swine (Ames, Iowa), and sheep (Dubois, Idaho); pasture (State College, Pa.) and poultry viability (East Lansing, Mich.) improvement; animal diseases (Auburn, Ala.) ; soybean industrial products (Urbana, Ill.) ; salinity of irrigation waters (Riverside, Calif.) ;

ACREAGE AND PRODUCTION OF FARM CROPS IN THE UNITED STATES IN 1939 AND 1940

Where no data are given, statistics are not available. <sup>a</sup> The production shown for countries in the Southern Hemisphere is for the crop years 1939-40 and 1938-39. <sup>b</sup> Present boundaries for 1940 estimates. <sup>c</sup> 1938. <sup>d</sup> Average 1933-37.

and relation of soils to plant, animal, and human nutrition (Ithaca, N.Y.). Regional laboratories for research on new and extended uses for surplus farm commodities, located near Philadelphia, Peoria, New Orleans, and San Francisco also made distinct progress during the year.

The Extension Service, co-operative among the U.S. Department of Agriculture, land-grant colleges and county governments, carried on varied activities during 1940 in every county of agricultural importance in the United States. The extension aids covered the entire range of farm and home activity from the preparation and storage of foods for consumption on the farm to the marketing of commercial crops. Its agents gave usable information and practical guidance to farm people of every group, and devoted special attention to needs of the lower-income groups. Exceptional conditions, resulting in part from the unresolved economic crisis and the European war, threw into the foreground the human problems of agriculture—those that result from misuse of soils, unbalanced or inefficient farming, contraction of export markets, and from the displacement of farm personnel through progress of agricultural technology. Owner-operators and tenant farmers in the low-income groups were helped to increase their cash crop income, to develop supplementary income from fruits and vegetables, to improve their homes, diets, health, and living standards through better management of incomes, and to co-operate more effectively with their neighbors. The services rendered aids to better economic and social organization as well as to better farm production and home economics. Extension agents assisted a total of about 5,500,000 farm families, white and Negro, and some 2,500,000 of these families were non-owners. White extension agents worked with Negro as well as white farmers and about 500 Negro agents worked with Negro families. The result was a definite raising of standards of farm practice and of farm living.

The Extension Service gave attention to technique of farm production for sale and encouraged production for consumption on the farm; helped about 1,000,000 low-income rural families in more than 12,000 communities to obtain surplus cotton and make it into mattresses for their own use; and provided technical knowledge and building plans leading to construction of thousands of inexpensive new farm homes and to the remodeling of many old dwellings. They helped farmers also to improve their kitchen facilities and other essentials of efficient home living. This program, making considerable use of farm-grown lumber, complemented extension work in economics of consumption, e.g. of food and clothing. Farm and home demonstrations assisted farmers to use farm outlook information better and to co-operate more effectively in the agricultural conservation program. Landlord-tenant co-operation was encouraged, particularly in improvement and stabilization of leasing systems. In 46 States the service co-operated with more than 70,000 farm men and women in organizing and conducting the work of more than 6800 community and county land-use planning committees. The total of \$33,052,000 of funds available in 1939-40 for all co-operative extension work comprised \$18,530,181 from Federal grants to the States, \$6,348,011 from State funds, \$7,181,799 from county appropriations, and \$992,009 from farm organizations.

#### World Conditions and American Agricul-

ture. Lost export markets for United States agricultural products as a result of the impact of the European war (treated above under *Foreign Trade in Farm Products*) was a major world condition affecting the American farming industry during the year. A number of measures employed or indicated as desirable to offset or soften the blow of this depressive factor included commodity loans, surplus disposal plans, and to cope also with increased consumer purchasing-power, adjustments in regional agriculture, e.g. widespread shifts in production of major farm commodities among producing regions. Increased attention was being paid to the development of closer inter-American co-operation, especially by encouraging the development of complementary agricultural products in the other American republics. Other movements and activities in foreign countries which had affected or might affect United States agriculture in its world trade relations, also discussed in detail in *Foreign Agriculture* (vol. 4, 1940), and in *Foreign Crops and Markets* (vols. 40 and 41, 1940), both U.S. Department of Agriculture, included the food and feed situation in continental Europe, 1940-41; wartime agricultural surpluses of the Danube Basin; the cession of important crop areas by Rumania; wartime agriculture and food control in Germany; agricultural conditions in Denmark, Finland, Netherlands, Norway, and Sweden, particularly as affected by the war; decline of hog numbers in many countries; Italian agriculture under fascism and war; Turkish agriculture and the changing agro-economic policy; expansion of cotton production in Southeastern Europe to meet needs of industry; the Russian peasant household under the *mir* and the collective farm system; British price policy and price developments in wartime, and control of agricultural prices in the United Kingdom; increase in Argentine production of vegetable oil and oil-seeds, and pastures and the cattle-grazing industry in Argentina; wartime agricultural measures in Canada, Japan's food self-sufficiency; the agriculture of Chosen, the Netherlands Indies, and the Philippine Islands and its problems; tobacco in the principal producing countries of the Far East; and United States re-exports of agricultural products, and agricultural trade with noncontiguous territories. See the respective countries under *Production*.

**Bibliography.** Books published in 1940 or late in 1939, which considered current problems of agriculture, included: H. P. Andersen, *Your Career in Agriculture* (New York, 1940); L. B. Bacon and F. C. Schloemer, *World Trade in Agricultural Products: Its Growth, Its Crisis, and the New Trade Policies* (Rome, 1940); P. W. Chapman, *Successful Farming in the South* (Atlanta, 1939); P. W. Chapman and R. H. Thomas, *Southern Crops* (Atlanta, 1939); R. T. Ely and G. S. Wehrwein, *Land Economics* (New York, 1940); W. F. Gerrish, *A Complete Guide to Soilless Gardening* (New York, 1940); N. S. B. Gras, *A History of Agriculture in Europe and America* (2d ed. New York, 1940); P. de Hevesy, *World Wheat Planning and Economic Planning in General* (New York and London, 1940); J. A. Hopkins, *Elements of Farm Management* Rev. ed. (New York, 1940); N. Jasny, *Competition Among Grains* (Palo Alto, Calif., 1940); D. E. Lindstrom, *The Church in Rural Life* (Champaign, Ill., 1939); W. G. **AIRPLANES, AIRPORTS, AIR TRANSPORT, AIRWAYS.** See AERONAUTICS

**AIR RAIDS, AIR WARFARE.** See AFRO-NAUTICS; EUROPEAN WAR; FIRE PROTECTION, NAVAL PROGRESS

**ALABAMA.** Area, 51,998 square miles, including (1930) 719 square miles of water. Population, Apr 1, 1940 (census), 2,832,961 (30.2 per cent urban), 1930, 2,646,248 (28.1 per cent urban). Birmingham had (1940) 267,583 inhabitants. Montgomery, the capital, 78,084; Mobile, 78,720.

**Agriculture.** Alabama harvested 7,847,980 acres, in 1940 of principal crops. Cotton, still the foremost of these, occupied 1,980,000 acres and gave 790,000 bales, of which the estimated value, to the growers, totaled \$37,130,000. Corn, on 3,476,000 acres, made 43,450,000 bu (estimated value, \$33,891,000); tame hay, on 852,000 acres, 606,000 tons (\$7,030,000); peanuts, 290,000 acres, 210,250,000 lb (\$6,097,000); sweet potatoes, 82,000 acres, 4,920,000 bu. (\$4,428,000); potatoes, 48,000 acres, 4,176,000 bu (\$2,174,000); oats, 150,000 acres, 3,000,000 bu. (\$1,650,000).

**Manufacturing.** Yearly production of manufactured goods in Alabama totaled \$574,670,690 for 1939, \$573,763,522 for 1937. Other manufacturing totals for 1939 (with those for 1937 subjoined) follow: 2052 (1874) manufacturing establishments paid \$92,018,670 (\$96,058,401) in wages to 116,800 (120,301) persons and contributed \$247,383,611 (\$237,435,861) as value added to goods by manufacture.

**Mineral Production.** Alabama's yearly production of native minerals was reckoned, in the *Minerals Year Book of 1940*, at \$46,496,293; a large additional total resulted from the processing of crude minerals to make coke and iron. Mines' output of coal rose to some 11,995,000 net tons for 1939, from 11,061,493 (value, \$26,769,000) for 1938. Coking ovens' yearly output totaled 3,854,505 net tons (1939) and 3,378,044 (1938); in value, \$10,917,559 and \$9,888,292. Mines' production of iron ore mounted to 5,960,507 gross tons for 1939, from 4,303,329 for 1938. The mines' shipments of iron ore totaled 5,985,208 tons (1939) and 4,281,332 (1938); in value, \$9,971,024 (1939) and \$7,341,620 (1938). The blast furnaces' output of pig iron, increasing to 2,717,502 gross tons for 1939 from 1,990,342 tons for 1938, rose in yearly total value

to \$43,902,681 for 1939, from \$29,190,091 for 1938. Shipments of cement, approximating production, rose to 5,042,921 bbl. for 1939, from 4,548,079 for 1938; in value, to \$6,690,765, from \$6,114,246. The yearly output of clay products (except pottery and refractories) attained \$1,487,067 for 1938.

**Education.** Alabama's inhabitants of school age (from 6 years to 20) were reckoned for the academic year 1939-40 at 875,019. The year's enrollments of pupils in all public schools numbered 686,767. Of these, 496,973 were in elementary study and the rest, 189,794, in high school. Expenditures for public schools, reported for the previous year, 1938-39, totaled \$25,027,706, of which \$18,828,876 was current expenditure. Teachers in the public schools and the distinct vocational-training system numbered 18,686, and their pay averaged \$696, in that year.

**History.** Alabama's statute making it a misdemeanor to picket for the purpose of hindering, delaying, interfering with, or injuring lawful business or to go near or loiter at premises in order to restrain persons from dealing or being employed there was overthrown by the U.S. Supreme Court; the decision held the statute an infringement of free speech. A newly created State Board of Pardons denied, March 8, a motion for the release of the five Negro convicts in the Scottsboro case; the Board indicated, however, a purpose to give future consideration to the cases individually, as the prisoners might show improvement under institutional care. The city of Bessemer engaged in canvassing with the aid of police, to win customers from the Birmingham Electric Company to the municipal system distributing electric current from the TVA, disputes between the city's and the company's men occurred, and some of the latter were arrested. See FLOODS

At the general election (November 5) the usual heavily Democratic vote went to Roosevelt for President; for Roosevelt (Dem.) 250,726; Willkie (Rep.) 42,184. Nine Democrats, all of them incumbents save one, were elected U.S. Representatives; there was no election for Governor.

**Officers.** Alabama's chief officers, serving in 1940, were Governor, Frank M. Dixon (Dem.), Lieutenant Governor, A. A. Carmichael; Secretary of State, John Brandon; Treasurer, Charles E. McCall; Auditor, Howell Turner; Attorney General, T. S. Lawson; Superintendent of Education, A. H. Collins.

**ALAND ISLANDS.** See FINLAND and SWEDEN under *History*.

**ALASKA.** Non-contiguous Territory of the United States. Area, 586,400 square miles, inclusive of inland waters. Population, 1940 (taken Oct. 1, 1939) 72,524; 1930, 59,278, whites (1930) numbered 28,640; Indians and Eskimos, 29,983. Capital, Juneau, population (1930), 4403. Governor, Ernest Gruening.

**Mineral Production.** The value of native minerals produced in Alaska in 1940, as stated by the U.S. Geological Survey, totaled \$27,658,000; to this sum, gold contributed more than nine-tenths. The value of gold in the material mined in 1940 was \$25,375,000, this exceeded the corresponding amount for any previous year of the Territory's mineral production. Such was not the case, however, with gold's yearly quantity. The gold in material mined in 1940 made some 725,000 Troy oz. Greater quantities had been produced yearly throughout the period 1905-16; they brought less, in each case, because the price of gold, set at \$35

an oz. in 1934, had previously been \$20.67. The mining of gold produced about \$2,100,000 more in 1940 than in 1939; an increase in placer mining activity brought a greater yield in 1940 from this type of gold-mining, and this additional yield was the main element in the higher production of 1940; the placers produced \$17,912,000; the lode mines, \$7,463,000. The Yukon region yielded \$11,636,000 of the placer gold Dredges brought in much the greater part of all placer production.

The production of platinum increased to 28,860 oz. for 1940, by value, \$1,092,000, surpassing previous yearly totals. Most of the platinum continued to come from the Goodnews district, near the mouth of the Kuskokwim River; it was obtained mainly by dredging. Coal was mined in the Healy River field (northern slope of the Alaska Range) and the Matanuska field (Cook Inlet). The production of coal totaled about 170,000 tons (value estimated at \$680,000) for 1940; the quantity exceeded that recorded for any previous year. The Healy River product was high-grade lignite, the Matanuska coal was bituminous. Copper-mining, which had formerly rivaled gold-mining in returns, dwindled further in 1940 to a mere production of some 70,000 lb. of recoverable metal, worth around \$7900; all of it was a by-product of ores of other metals.

**Fisheries and Furs.** The salmon fishery took, in 1939, 79,220,420 salmon, chiefly pinks and reds; the pack of canned salmon, 5,263,153 cases, was valued at \$34,441,082. The totals fell below those of 1938, also an off year. Salmon, nevertheless, came to 73 per cent in bulk and 91 per cent in value of the production of all fish in 1939. Herring products attained \$2,090,743; the catch of halibut, \$893,686.

At the Pribilof Islands the Government took, in 1939, 60,473 skins of fur seals; it sold at St Louis 51,257 dyed sealskins, which brought \$1,066,250. A computation at the Pribilofs in 1939 showed the fur seals as still on the increase and numbering 2,020,774. The value of other furs, shipped from Alaska in 1939, totaled \$1,892,968; beaver, mink, and blue fox furnished the greater part of the total.

**Transportation and Roads.** The Alaska Railroad, owned and operated by the Federal Government, connects Seward, on the Southern coast, with Fairbanks, to the north, and maintains transportation by water, in the open season, thence to places on the Yukon River. It hauled by rail, in the operating year 1939-40, 194,467 tons of freight and 29,510 passengers. The freight, mainly coal, paid \$2,311,152, or somewhat under \$12 to the ton; the passengers paid \$264,715, or \$9 to the passenger, on the average. Including river traffic the system's receipts, \$3,058,055, exceeded operating expenses, \$2,712,628, by more than \$340,000. Aviation rivaled the railroad in number of passengers, if not in freight. In the fiscal year 1939-40, aviators reported making 14,296 trips, covering 3,598,790 miles, and carrying 31,435 passengers and 4,315,660 lb. of freight. The Alaska Road Commission, a part of the War Department, maintaining 1932 miles of road and a great mileage of trail, had spent, up to June 30, 1939, \$27,783,560 in 34 years, to build and maintain roads in the Territory; it spent \$240,766 for new construction and \$704,056 for maintenance in the year that followed.

**Agriculture.** Interest in the possibilities of agriculture still centered on the Federal colony in the Matanuska Valley. The colony, despite some defec-

tions, comprised (1940) 147 occupied tracts; these had about 4200 acres cleared and planted, mainly to peas, oats, and hay, but also to other grains and a variety of vegetables. There were some 500 milch cows in the valley. The colony's co-operative association took over from the Government (Jan. 15, 1940) the direction of a hospital, power house, and other public services.

The colonists and other farmers of the Matanuska Valley were reported to have sold, in the crop season of 1939, \$9521 of vegetables, \$4469 of butter fat, \$4517 of eggs, and \$7661 of meat. Of these sums' total, \$26,168, the colonists sold \$21,680. There were prospects that the aeronautical base at Anchorage would create much additional demand for the produce.

**History.** Governor Gruening gave particular attention, in his annual report, to Alaska's relative freedom from taxation. He indicated the absence of a general tax on property (save in incorporated places), and of taxes on incomes and on corporations, and concluded that the system of taxation needed revision in the interest of the Territory's aspirations.

The construction of aeronautical bases for the Army and Navy, at Anchorage and other points, went on actively during the year. Laws to hasten colonization for the aid of defense were sought in Washington.

The Federal Government put in motion early in 1940 a project of distributing reindeer among the Eskimo population. It was estimated that, before this distribution, 4700 natives, mainly Eskimo, owned in all some 300,000 reindeer, while 46 whites, engaged in reindeer-herding, had about 180,000. Despite the widespread Eskimo ownership, it appeared that families in considerable number possessed no reindeer and lacked sufficient support of other kinds. The plan was to buy animals from white herders at three dollars a head or thereabout and donate them to the non-possessors.

The Territorial Legislature enacted changes tending to increase payments obtainable under the unemployment-compensation law. That law, even before amendment, brought about a fairly big distribution of money—\$349,923 for the calendar year 1939, or about 44 per cent more per capita than the corresponding rate for the Union. In the first half of 1940 the payments ran to \$283,749. In consequence of labor troubles that had interrupted the salmon fishery sailing yearly from San Francisco, people formerly employed in these expeditions' canneries claimed a relatively great total in unemployment compensation; the Territorial unemployment-compensation commission's examiner held the claims invalid; they were still in course of adjudication late in the year. Their amount was said to exceed the sum on hand from the levies on the canners and to threaten the stability of the whole fund for unemployment compensation in Alaska.

See GENERAL LAND OFFICE; METEOROLOGY; TIN.

**ALBANIA.** A former Balkan kingdom on the east shore of the Adriatic Sea, occupied by Italian troops on Apr. 7, 1939, and proclaimed an Italian protectorate the following day. Area, 10,629 square miles; population, estimated at 1,057,000 on Dec. 31, 1938 (1,003,124 at the 1930 census). Capital, Tirana (pop. 30,806 in 1930); other chief towns, Scutari (Shkodër), 29,209; Koritsa (Korçë), 22,787; Elbasan, 13,796; Durazzo (Durrës), the chief port, 8739.

**Defense.** The Albanian army was incorporated in the Italian defense establishment May 29, 1939.

**Education and Religion.** Primary education is nominally compulsory, but illiteracy remains high. In 1939 there were 663 state primary schools, with 56,936 pupils; 19 intermediate schools, with 6235 pupils; and about 500 Albanian students in various foreign universities. The estimated religious division of the population was: Moslems, 688,280; Orthodox Christians, 210,313; Roman Catholics, 104,184.

**Production.** Albania's chief products are corn, tobacco, wool, timber, hides, dairy products, fish, olive oil, and petroleum (see 1939 YEAR BOOK for available production figures). The December, 1938, livestock census showed 391,175 cattle, 1,573,857 sheep, 932,333 goats, 54,426 horses, 44,579 asses, and 10,391 mules. Besides petroleum, with an output estimated at 300,000 metric tons in 1939, there are considerable mineral resources. These were under development by Italy in 1940. The first shipment of 1000 metric tons of chromite was exported to Genoa in April. Flour, olive oil, and cheese are the principal manufactures.

**Foreign Trade.** Imports in 1938 totaled 22,397,890 gold francs (1 franc equalled 6.25 Italian lire), of which 8,337,109 francs were from Italy, exports, 9,749,959 francs (6,665,257 to Italy). Wool, hides and furs, cheese, cattle, eggs, and timber are the chief exports.

**Finance.** Budget estimates for the fiscal year ended Mar. 31, 1940, balanced at 40,000,000 gold francs. The 1938-39 estimates were: Receipts, 28,565,499 francs, expenditures, 28,235,400. The public debt in 1938 was 68,200,000 gold francs, outstanding from a series of loans extended by Italy in return for political and economic concessions (see 1938 YEAR BOOK, p. 27).

**Transportation.** Early in 1940, Italian sources announced that work would begin in April on a railway from the port of Durazzo to Elbasan and Labinoti, a distance of 56 miles. There are no other railways. Highways in 1940 were reported to total 1759 miles, but only about 750 miles were suitable for automobiles. Italian air services connect Tirana and other Albanian cities with Rome and other points.

**Government.** On Apr. 12, 1939, an Italian-controlled Constituent Assembly at Tirana abrogated the Albanian constitution and ended King Zog's regime. A new government headed by Premier Shevket Verlaci offered the Crown of Albania to King Victor Emmanuel of Italy. A personal union between the two kingdoms was effected on April 14. A constitutional statute issued by Victor Emmanuel on June 3, 1939, made the Albanian throne hereditary under his dynasty and vested legislative, judicial, and executive powers in the King's hands. Legislative powers were delegated in part to an Albanian Fascist Corporative Council, based on a newly organized Albanian Fascist party, and executive and judicial powers to Albanian officials acting under Italian guidance. Albanian remained the official language. A treaty signed the same date placed Albania's foreign relations in the hands of the Rome Government (see YEAR BOOK, 1939, p. 22).

**History.** The task of converting Albania into a base for Italian military operations in the Balkans, started under the direction of the Italian Chief of Staff soon after the annexation to Italy in 1939, was pushed rapidly forward during the first 10 months of 1940. The Italian budget for 1940, published in January, contained 300,000,000 lire for land reclamation projects and strategic

roads in Albania. In April it was announced that 25,000 Italian workmen were being sent to Albania to construct roads and other public works. Some of them assisted large contingents of Italian troops in converting Koritsa and other Albanian towns covering the Greek and Yugoslav frontiers into military bases. On May 21-26 Count Ciano, Italian Foreign Minister, made a tour of the Italian construction projects in Albania. At Tirana he announced the appointment of two Albanians as Ministers of State. The puppet government there responded with a pledge of support for Italy in the event she entered the European War.

Meanwhile Greek and Yugoslav sources reported frequent shipments of additional Italian troops and supplies to Albania. In May and again in August uprisings were reported in mountainous districts as a result of the requisitioning of livestock and the conscripting of natives for service in the Italian military forces. The August revolt apparently assumed serious dimensions among the Mirditi tribesmen south of Scutari. Albanian exiles in Yugoslavia continued their efforts to organize resistance to the Italian occupation of their country, despite restriction upon their activities by the Yugoslav authorities. The Belgrade Government in May reportedly rejected a request from the exiled King Zog, who was then in France, for permission to enter Yugoslavia. Upon the German invasion of France, Zog with his Queen and the infant Crown Prince escaped to England, arriving in London June 27.

Coincident with Count Ciano's visit to Albania, an Italian-sponsored agitation for the expansion of Albania's frontiers to include the Albanian minorities in Yugoslavia and Greece attracted attention. This agitation assumed a more menacing tone following Italy's entrance into the European War, and was eventually channeled mainly against Greece. During August, September, and October, the Italian-controlled Albanian press bitterly criticized alleged Greek persecutions of the Albanian minority in Greece and provocative forays across the Albanian frontier. One such alleged incursion was given as a reason for the Italian invasion of Greece, launched October 28 (see GREECE and ITALY under History; EUROPEAN WAR). The Greeks denied all of these charges.

Albania suffered severely when the Italian invaders were driven out of Greece and pursued deep into Albanian territory. Koritsa, one of the chief cities, was taken by the Greeks after a long artillery bombardment. Tirana, the ports of Durazzo, Valona and Porto Edda (Santi Quaranta), and other points were repeatedly bombed by Greek and British air forces while the Italian and German air forces devastated the Greek-occupied districts. Rebellious Albanian tribesmen were reported to have extended their guerrilla warfare against the Italians, while some of the Albanian conscripts either deserted or surrendered to the Greeks without fighting. In December King Zog was reported to have arrived in the Balkans to aid in organizing the Albanian rebellion. Severe fighting was continuing at the year end.

**ALBERTA.** A prairie province of Canada. Area, 255,285 square miles; population (June 1, 1939 estimate), 789,000 compared with (1936 census) 772,782. Chief cities (1936 census figures in parentheses): Edmonton (85,774), Calgary (83,407), Lethbridge (13,523), Medicine Hat (9592). Vital statistics (1939): 16,323 living births, 5780 deaths, and 7835 marriages. Education (1938):

180,308 students enrolled in schools and colleges of all kinds.

**Production.** The gross value of agricultural production for 1939 was \$173,139,000. Crop output (1939): Wheat 150,000,000 bu., oats 85,000,000 bu., barley 27,000,000 bu., rye 2,400,000 bu., flaxseed 350,000 bu., potatoes 60,950 tons, hay and clover 569,000 tons, alfalfa 207,000 tons, grain hay 1,425,000 tons, sugar beets 262,000 tons. The value of all field crops in 1940 totaled \$136,225,000 (\$121,132,000 in 1939). Livestock (1939): 1,337,400 cattle, 993,000 swine, 834,300 sheep, 658,600 horses, 7,723,000 poultry. Fur production (1937-38): 1,476,696 pelts valued at \$1,156,011 (\$1,345,100 in 1938-39). The output of the forests in 1938 was equal to 104,630 M cu. ft. valued at \$3,169,009.

Mineral production (1939) was valued at \$30,691,617 of which coal (5,519,208 tons) accounted for \$14,415,281, petroleum (7,576,932 bbl.) \$9,362,363, natural gas (22,513,660 M cu. ft.) \$4,915,832. Manufacturing (1938): 970 factories, 12,684 employees, \$30,755,626 net value of products.

#### PRODUCTION OF ALCOHOLIC LIQUORS, FISCAL YEARS 1933 TO 1940

[Report of the Alcohol Tax Administration]

Year	Alcohol <sup>a</sup>	Distilled spirits	Still wines	Sparkling wines	Fermented malt liquors
	Proof gallons	Tax gallons	Gallons	Gallons <sup>b</sup>	Barrels <sup>c</sup>
1933	115,609,754	7,795,160	18,755,652	35,819	9,797,818
1934 <sup>d</sup>	165,103,582	76,506,388	77,778,388	532,874	37,678,313
1935	180,645,920	169,126,472	91,930,362	310,722	45,228,605
1936	196,126,236	253,867,925	170,903,108	413,851	51,812,067
1937	223,181,228	258,956,886	222,045,241	481,126	58,748,087
1938	201,033,858	150,155,924	228,726,368	489,014	56,340,163
1939	201,017,546	145,326,176	231,959,287	334,188	53,870,553
1940	243,727,756	143,455,192	212,367,737	481,740	54,891,737
Total	1,526,445,880	1,205,190,123	1,154,466,143	3,079,334	368,367,338

<sup>a</sup> Approximately 87 per cent of this alcohol is denatured and used for industrial purposes <sup>b</sup> Converted from half-pint units, using 20 half-pint units per gallon <sup>c</sup> Sales of fermented malt liquors containing not more than 3 2 per cent alcohol by volume legalized for beverage purposes Apr 7, 1933 <sup>d</sup> Sales of all liquors for beverage purposes legalized Dec 5, 1933 <sup>e</sup> Barrels of 31 gallons

**Government.** Finance (1938-39): revenue, \$24,269,817, expenditure, \$21,242,625; public debt (net), \$125,917,194. The King is represented by a lieutenant-governor (appointed by the governor-general in council), aided by a ministry which is responsible to the legislature and resigns office when it fails to hold the confidence of that body. There are 57 members in the legislature (including the ministry), all elected by direct vote of the people. After the provincial general election held on Mar 21, 1940, the standing of parties in the legislature was: Social Credit 36, Independents 19, Labor and Liberal 1 each. The province is represented by 6 senators (appointed for life) and 17 commoners in the Dominion parliament at Ottawa. Lieutenant-Governor, J. C. Bowen (appointed Mar. 20, 1937); Premier, William Aberhart (Social Credit). See CANADA.

**ALBERT CANAL.** See BELGIUM under History; EUROPEAN WAR.

**ALCOHOLIC LIQUORS.** Trends in the production of alcoholic liquors since the repeal of the prohibition amendment in 1933 appear in the accompanying table from the report of the Alcohol Tax Administration of the U.S. Treasury Department. Production of alcoholic beverages has maintained a fairly even pace for the past three or four years, indicating a better adjustment of the industry to demand than was possible in the years immediately following repeal. The quantity of alcohol produced more than doubled in the seven-year period; since the larger portion of alcohol is de-

natured, the increase has little to do with repeal but reflects increased industrial use.

Tax collections on liquors for the fiscal year 1940 maintained the upward trend of previous years, totaling \$624,253,156, as compared with \$587,799,700 in 1939. The principal items were: distilled spirits, \$346,833,775; fermented malt liquors, \$267,776,187, and wines, \$9,643,193. Tax-paid withdrawals of domestic alcoholic liquors were also well above the previous year, totaling 128,325,941 tax gal. for distilled spirits (including alcohol), 82,176,586 gal. for still wines, 418,830 gal. for sparkling wines, and 53,014,230 bbl. (of 31 gal.) for fermented malt liquors.

The success of the Alcohol Tax Administration in its efforts to reduce the illicit liquor traffic to a minimum is indicated in the consistently small number of seizures over the past three years. During the last year of prohibition, 29,561,813 gal. of mash were seized for violation of prohibition and internal revenue laws relating to liquors. Because of the inability of legitimate producers to cope

with demand, bootlegging continued to thrive in the immediately succeeding years and seizures were still at the high level of 21,373,107 gal. for the fiscal year 1935. By contrast, the figure for 1938 was 7,553,848 gal., for 1939 was 8,076,461, and for 1940 reached the new low of 6,480,240. The number of stills seized in 1940 was 10,663; number of vehicles seized, 4523; number of persons arrested, 25,638.

**ALEXANDRETTA,** Sanjak of. See SYRIA AND LEBANON.

**ALFALFA.** See ENTOMOLOGY, ECONOMIC; HAY

**ALGERIA.** A North African colony of France. Area, 851,350 square miles, of which all except 222,206 square miles are desert. Capital, Algiers (Alger). The estimated population (Dec 31, 1938) was 7,490,000. At the 1936 census there were 7,234,684 inhabitants (6,592,033 in the Northern Territory and 642,651 in the Southern Territory), including 987,252 Europeans (853,209 French citizens) and 6,247,432 Moslem natives. On July 22, 1940, there were 20,000 Italians permanently established in Algeria. Chief cities (1936 populations): Algiers, 264,232; Oran, 200,671; Constantine, 113,777; Bona (Bone), 86,332; Philippeville, 66,112; Sidibel-Abbes, 54,754. Education (1938): For non-Moslem education, there were 21,249 pupils in 120 infant schools, 159,725 pupils in 1224 primary schools, 9386 pupils in 30 higher primary schools, 14,306 pupils in 18 secondary schools, 484 students in 6 normal schools for

teachers, and 2248 students in the university at Algiers. For Moslem education, there were 77,022 students in 692 schools.

**Production.** The main occupations of the people are agriculture and stock raising. In 1939 the yields of the important cereal crops (in metric tons) were: Wheat 1,160,000, barley 1,100,000, oats 220,000. Other important products (1938 production figures in metric tons unless otherwise stated) were: Olive oil 10,300 (1938-39), potatoes 145,300, tobacco 19,400, wool and mohair 7400, wine 567,703,479 U.S. gal. Dates, figs, bananas, and almonds grow abundantly. Livestock (1938): 181,000 horses, 182,000 mules, 319,000 asses, 789,000 cattle, 5,965,000 sheep, 2,737,000 goats, 170,000 camels, and 60,000 swine. The 1936 fisheries catch was valued at \$1,750,397 francs. Mineral production (1938), in metric tons (figures are, in most cases, for metal content of ore): iron ore 1,649,000, lead 4400, phosphate rock 584,000, pyrites 44,000, zinc ore 7000, antimony 150.

**Foreign Trade.** In 1938, imports totaled 4,995,000 francs; exports, 5,639,000 francs. Normally over 80 per cent of Algeria's trade was with France. The average exchange value of the franc was \$0.0251 for 1939, \$0.0288 for 1938. See **TRADE, FOREIGN**.

**Finance.** Budget (1939): Revenue, 2,416,617,471 francs; expenditure, 2,322,898,075 francs. Estimates (1940): Revenue, 2,526,128,968 francs; expenditure, 2,525,778,285 francs.

**Transportation.** The 2735 miles of railway line open for traffic during 1938 carried 8,439,899 passengers and 5,328,321 tons of freight. The air services with France, Morocco, Belgian Congo, French Congo, and Tunisia were disrupted as a result of the capitulation of France in the European War. Later there was a partial restoration of air communications. During 1938 some 3956 ships aggregating 7,163,459 tons entered the ports of Algeria. See **ROADS AND STREETS**.

**History.** Algeria and the adjoining French North African colonies became the principal bastion of French power and the principal hope for survival of the French empire after the French Government's capitulation to Germany in June, 1940. Substantial sentiment for continuing the war on the side of the "Free French" forces of Gen. Charles de Gaulle was reported. However the civilian officials and military commanders of French North Africa adhered to the Vichy Government and successfully held their colonies in line. The British attack on the French fleet at Oran on July 3 strengthened North Africa's ties with the Pétain Government.

Gen. Auguste Nogues, French High Commissioner for North Africa and commander of its armed forces, declared on June 25 that the armed forces would not be reduced despite the signing of the armistice and that any foreign effort to seize control would be resisted. However members of the Italian Armistice Commission were reported in December to be controlling shipping between French North African ports and Marseille.

To tighten its grip on North Africa, the Vichy Government in mid-July appointed Admiral Jean Marie Abrial to replace Georges Le Beau as Governor General of Algeria. Later Gen. Maxime Weygand was sent to Algiers to command all French armed forces in Africa and Syria. At the risk of alienating the native Jewish and Moslem populations, Governor General Abrial placed in effect many of the anti-democratic measures pre-

viously introduced in France by the Pétain Government. The Cremieux Law of 1870, giving the Jews of Algeria the same civil and political rights as Frenchmen, was repealed on October 8.

Like the neighboring French colonies, Algeria was hard hit economically by the developments in France and the subsequent partial application of the British blockade. In mid-July directors of financial and economic services in French North Africa met in Algiers to seek a restoration of normal economic activity through developing inter-colonial trade, etc. Little improvement in conditions was apparent by the year's end and economic difficulties were said to be fanning native unrest.

**ALL-AMERICAN CANAL.** See **AQUEDUCTS**; **RECLAMATION, BUREAU OF**.

**ALSACE-LORRAINE.** The two border provinces annexed by Germany after the Franco-Prussian War and returned to France by the Versailles Treaty (June 29, 1919). They were re-occupied by German troops in June, 1940, and re-incorporated in the Reich on or about Nov. 30, 1940. Area, 5605 square miles; population (1936 census), 1,915,627. Lorraine was merged with the Saar district (Saarpfalz) to form the new German province of Westmark. See **FRANCE** and **GERMANY** under *History*.

**ALTMARK INCIDENT.** See **NORWAY** under *History*.

**ALUMINUM.** Two events of 1940 marked the importance of aluminum and its principal ore, bauxite, in the conduct of modern warfare. The defense program of the United States, coupled with aid to Great Britain, created a demand for light metals and alloys for airplanes and other equipment that made necessary a great increase in domestic production facilities. The conquest of France by Germany gave the latter full access to the high grade bauxite deposits that had previously made France the largest single producer of the ore. It may be assumed, therefore, in the absence of statistics, that Germany continued in 1940 to hold first place as a producer of aluminum, with the United States second, as in 1939.

During the year the Aluminum Company of America announced three price reductions of one cent each, in March, August, and November, bringing the price down to 17¢ per lb. A price of 20¢ had prevailed throughout 1938 and 1939. The company also greatly expanded its facilities for producing metal. Ingot production in the latter part of 1940 reached the rate of about 465,000,000 lb. per year, compared with 327,000,000 lb. in 1939. Production was expected to reach an annual rate of 690,000,000 lb. by July, 1941, and 825,000,000 lb. early in 1942.

The Government lent the Reynolds Metals Company \$15,800,000 to construct a plant in the Tennessee Valley for the production of 10,000 tons of aluminum a year. Construction was to be completed in 1941.

Transit difficulties affected normal shipments of ore from Italy, Yugoslavia, Greece, Hungary, Rumania. Production in the Guianas was greatly increased to supply the United States and Canada. Imports of crude bauxite ores into the United

States for the calendar year of 1940 amounted to 629,552 tons.

Public anxiety over reported shortage in aluminum supplies, and the effect of that shortage on national defense was quieted by the National Defense Commission, which explained that ample provision had been made for metal production, and a temporary deficiency in forge-hammer capacity was rapidly being remedied.

See CHEMISTRY, INDUSTRIAL; ELECTRICAL INDUSTRIES; LABOR CONDITIONS under *Strikes*.

H. C. PARMELEE.

## AMBASSADORS AND MINISTERS.

The accompanying table lists the diplomatic rep-

DIPLOMATIC REPRESENTATIVES BETWEEN THE UNITED STATES AND FOREIGN COUNTRIES, 1940

Country	To the United States	From the United States
Afghanistan ..		Louis G. Dreyfus, Jr. (E) *
Argentina ..	Don Felipe A. Espil (A)	Norman Armour (A)
Australia ..	Richard G. Casey (E)	Clarence A. Gauss (E)
Belgium ..	Count Robert van der Straten-Ponthoz (A)	John Cudahy (A)
Bolivia ..	Don Luis Fernando Guachalla (E)	Douglas Jenkins (E)
Brazil ..	Carlos Martins (A)	Jefferson Caffery (A)
Bulgaria ..	Dimitri Naoumoff (E)	George H. Earle III (E)
Canada ..	Loring C. Christie (E) *	Jay Pierrepont Moffat (E)
Chile ..	Don Alberto Cabero (A)	Claude G. Bowers (A)
China ..	Hu Shih (A)	Nelson T. Johnson (A)
Colombia ..	Gabriel Turbay (A)	Spruille Braden (A)
Costa Rica ..	Don Luis Fernández (E)	William H. Hornbrook (E)
Cuba ..	Pedro Martínez Fraga (A)	George S. Messersmith (A)
Czechoslovakia ..	Vladimir Hurban (E)	
Denmark ..	Henrik de Kauffmann (E) .....	Ray Atherton (E)
Dominican Republic	Don Andrés Pastoriza (E)	Robert M. Scotten (E)
Ecuador ..	Capitán Colon Eloy Alfaro (E) *	Boaz Long (E)
Egypt ..	Mahmoud Hassan Bey (E)	Bert Fish (E) *
El Salvador ..	Don Hector David Castro (E)	Robert Frazer (E) †
Estonia ..	Johannes Kaiv (C) *	John C. Wiley (E) †
Finland ..	Hjalmar J. Procopé (E)	H. F. Arthur Schoenfeld (E)
France ..	Gaston Henry-Haye (A)	Admiral William D. Leahy (A)
Germany ..	Hans Heinrich Dieckhoff (A) *	— (A)
Great Britain ..	Marquess of Lothian (A) *	— (A) *
Greece ..	Cimon P. Diamantopoulos (E)	Lincoln MacVeagh (E)
Guatemala ..	Don Adrian Recinos (E) .....	Fay A. Des Portes (E)
Haiti ..	Elie Lescot (E) .....	Ferdinand L. Mayer (E)
Honduras ..	Don Julian R. Caceres (E) .....	John D. Erwin (E)
Hungary ..	Stephen de Rothkugel †	John Flournoy Montgomery (E)
Iran ..	Mohammed Schayesteh	Louis G. Dreyfus, Jr. (E) *
Iraq ..		Paul Knabenshue (C)
Ireland ..	Robert Brennan (E)	David Gray (E)
Italy ..	Ascanio dei principi Colonna (A)	William Phillips (A)
Japan ..	Morito Morishima †	Joseph C. Grew (A)
Latvia ..	Alfred Bilmanis (E)	John C. Wiley (E) †
Liberia ..		Lester A. Walton (E)
Lithuania ..	Povilas Zadelkis (E)	Owen J. C. Norem (E)
Mexico ..	Don Francisco Castillo Nájera (A)	Josephus Daniels (A)
Netherlands ..	A. Loudon (E)	George A. Gordon (E)
Nicaragua ..	Don Leon De Bayle (E)	Meredith Nicholson (E)
Norway ..	Wilhelm Munthe de Morgenstjerne (E)	Mrs. Florence Jaffray Harriman (E)
Panama ..	Don George E. Boyd (A)	William Dawson (A)
Paraguay ..	Don Juan José Soler (E)	Findley B. Howard (E)
Peru ..	Don Manuel de Freyre y Santander (A)	R. Henry Norweb (A)
Poland ..	Count Jerzy Potocki (A)	Anthony J. Drexel Biddle, Jr. (A)
Portugal ..	João Antonio de Bianchi (E)	Herbert Claiborne Pell (E)
Rumania ..	Brutus Coste †	Franklin Mott Gunther (E)
Saudi Arabia ..		Bert Fish (E) *
Spain ..	Don Juan Francisco de Cárdenas (A) ..	Alexander W. Weddell (A)
Sweden ..	W. Roström (E)	Frederick A. Sterling (E)

Thailand (Siam) ..	Mom Rajawongse Seni Pramoj (E) ..	Hugh Gladney Grant (E)
Turkey ..	Mehmet Münir Ertegun (A) .....	John Van A. MacMurray (A)
Union of South Africa	Ralph William Close (E)	Leo J. Keena (E)
U S S R ..	Constantine A. Oumansky (A)	Laurence A. Steinhart (A)
Uruguay ..	J. Richling (E)	Edwin C. Wilson (E)
Venezuela ..	Don Diogenes Escalante (A)	Frank P. Corrigan (A)
Yugoslavia ..	Constantin Fotitch (E)	Arthur Bliss Lane (E)

\* Accredited also to Iran \* Succeeded by Leighton McCarthy, announced on Feb. 25, 1941 \* Hold the rank of Ambassador for the duration of the Ecuador-Peru boundary dispute \* Accredited also to Saudi Arabia; resident at Cairo, Egypt \* Acting / Accredited also to Latvia \* Absent. \* Marquess of Lothian died Dec. 23, 1940; succeeded by Lord Halifax, appointed Dec. 23, 1940 \* John G. Winant, appointment confirmed on Feb. 10, 1941. † Chargé d'Affaires ad interim. \* Accredited also to Afghanistan \* Accredited also to Estonia \* Accredited also to Egypt; resident at Cairo, Egypt  
 NOTE. On Feb. 10, 1941, the United States Senate unanimously confirmed the following nominations; John G. Winant to be Ambassador to Great Britain; Anthony J. Drexel Biddle, Jr., Ambassador to Poland, to serve also as Ambassador to the governments of Belgium, Norway, and The Netherlands at London, England; Alexander C. Kirk to be Minister to Egypt; Jay Pierrepont Moffat, Minister to Canada, to serve also as Minister to the government of Luxembourg now established in Canada; Nelson T. Johnson, Ambassador to China, to be Minister to Australia; Bert Fish, Minister to Egypt, to be Minister to Portugal; Edwin C. Wilson, Minister to Uruguay, to be Minister to Panama; Clarence A. Gauss, Minister to Australia, to be Ambassador to China; William Dawson, Minister to Panama, to be Ambassador to Uruguay; Admiral Kichisaburo Nomura, the new Japanese Ambassador to the United States, presented his credentials to President Roosevelt on Feb. 14, 1941.

of Labor to the people of America. During those years the membership of the Federation grew from 50,000 to 4,247,443 (the figure presented to the 1940 convention, representing the tax-paying membership on Aug. 31, 1940); and working and living conditions for the vast millions of wage earners and their dependents have been improved to an extent that would have been considered beyond possible attainment at the beginning of the history of the organization. Work hours have been reduced, wages greatly increased, and opportunities for growth, recreation, and improvement culturally and economically achieved both for those organized in trade unions and others who benefited indirectly through the organized trade union movement.

In startling contrast with the almost complete destruction of the trade union movements of the Old World, the reports submitted to the 1940 convention of the Federation showed progress in every way. The treasury reflected the healthy condition of the movement by a report of receipts in excess of expenditures by \$169,476.46. During the year \$953,481.38 was expended for organizing expenses which included services to directly affiliated trade and Federal labor unions as well as the formation of and assistance to newly formed locals of national and international unions and on behalf of State federations of labor and city central bodies.

In the 12 month period ending Aug. 31, 1940, 327 charters were issued. Of these 2 were to new international unions (the United Cement, Lime and Gypsum Workers International Union, and Circus, Carnival, Fairs, Rodeo International Union); 23 to central bodies, 229 to local trade unions, and 73 to Federal labor unions. On Aug. 31, 1940, there were affiliated with the A.F.L. a total of 105 national and international unions comprising approximately 35,000 local unions, 49 State federations of labor, 816 central labor unions, 4 Departments, 1450 directly affiliated local trade and Federal labor unions. Total membership increased by 241,089. The organizing staff comprised 141 special paid organizers, 1822 volunteer organizers, and the officers of the 816 central bodies who are available on call to duty in assisting directly affiliated unions in case of strike or lockout.

There were two changes in the official family of the A.F.L. in 1940 occasioned by the death of John Coefield, and the resignation of Arthur O. Wharton. The Executive Council consists of the following: William Green, President; George Meany, Secretary-Treasurer; Vice-Presidents, William L. Hutcheson, T. A. Rickert, Matthew Woll, Joseph N. Weber, G. M. Bugmazet, George M. Harrison, Daniel J. Tobin, Harry C. Bates, Edward J. Gainer, W. D. Mahon, Felix H. Knight, George E. Browne, Edward Flore, Harvey W. Brown, and W. C. Birthright, in the order named. Elections are held at the annual conventions. All incumbent officers were re-elected for the year ending Dec. 31, 1941.

In accordance with the plan of organization whereby related unions are first formed into national councils under the guidance of the A.F.L. prior to being chartered as autonomous national or international unions, two additional councils were formed in 1940—the National Council of Chemical Workers Unions, and the American Editorial Association.

As a result of conferences between officers of the two organizations at interest, within the past year the International Ladies Garment Workers Union again resumed affiliation with the A.F.L. Confer-

ences looking toward a return of the International Typographical Union to affiliation with the American Federation of Labor, were being held at the end of the year.

As the need became greater for increased finances with which to engage in organization work, a temporary increase in the per capita tax was effected in 1937 by an assessment of one cent per member per month on all members of national and international unions. The success which has attended organizing efforts was convincing proof of the need for a continuation of this work through sustained increase in the established income of the Federation, and as a result the constitution was amended by the 1940 convention to fix the per capita tax from national and international unions at two cents per member per month. This was, in effect, a continuation of the amount which has been paid since 1937 but establishes the revenue of the Federation on a permanent and stable basis.

As the effectiveness of trade unions has increased and their power in the economic world has become accepted, there have been those who have sought to utilize offices within the labor movement for their own unscrupulous purposes. This has mitigated against the best interests of the labor movement as a whole. The danger from such misuse of trade union membership and office was recognized in the 1940 convention, and a report of the Federation's Executive Council was adopted calling upon all members of unions directly chartered by the A.F.L. to exercise all care and diligence in preventing exploiters and gangsters from securing official positions in their organizations and from exercising control over their administrative policies. The national and international unions chartered by the A.F.L. are autonomous and exercise full and complete authority over their own administrative policies so far as the Federation is concerned. However, the Executive Council urged that the membership of such unions select and elect men of known honesty and integrity to official positions, and to prevent those with criminal records from holding official positions or from representing them in any capacity whatsoever. This admonition of the Executive Council, adopted by the convention, clarifies the position of the A.F.L. with regard to undesirable persons within the labor movement.

During the year 1940 the A.F.L. continued its study of the facts showing the relation between productivity and hours of work in industry. This has been especially important in view of the increasing demand being made upon American industry for defense materials and the advancement of a short-sighted policy advocating abandonment of established standards governing hours of work without regard for the supply of labor available and not being utilized. The investigation reaffirmed the position of Labor that the shorter work week is imperative to sustained economic advance. The Federation took a positive stand against pressure exerted by certain manufacturers for at least a relaxation of the 40-hour week standard which became effective Oct. 24, 1940, under the Fair Labor Standards Act, and declared for even greater adjustment of work hours to increasing productivity.

Careful consideration has been given to the relation between increased productivity and earnings. Increasing productivity has made possible a steady decline in labor costs, and while average hourly earnings reached an all-time peak in 1940, manufacturers' labor cost is considerably below the level

of ten years ago. This brings out a very important economic factor, as pointed out by the Executive Council: while wages have risen steadily, the labor costs to manufacturers have steadily declined. It is, however, a fact that a large part of the saving from reduced labor costs have been passed on to the consumer. In its report to the 1940 convention the Executive Council further pointed out that by steadily increasing productivity American industry can pay an hourly wage 22 per cent above 1939, charge a price 15 per cent below 1929, and still reduce labor cost per \$100 of product by 5.7 per cent. This steady increase in productivity makes possible a continual rise in wages and shortening of hours.

During 1940 the Federation continued a full measure of co-operation in the administration of the Fair Labor Standards Law and in an effort to broaden its scope as well as improve standards under the law. Representatives of the A.F.L. have served on all industry committees appointed, presenting evidence and arguments at all hearings.

Efforts were also made during the year to secure amendments to the National Labor Relations Act so that it may more nearly approximate its original intent and purpose.

In connection with the defense program in which the Nation is engaged, the Federation has considered the problem of maintenance of social security rights earned by workers while engaged in covered industries and who may now or later be engaged in government work or military service. The A.F.L. convention went on record as favoring adequate protection for such workers by co-ordination of existing plans to provide for all workers engaged in the defense program.

In connection with relief agencies, the A.F.L. convention gave special consideration to WPA and housing projects. In connection with WPA and other Federal relief projects the Federation declared its belief that in the development and expansion of the defense program a clear-cut separation should be made between public works and work relief. The Federation further declared in favor of a long-range public works program designed to meet the immediate public works needs of the nation and provide the necessary means of expansion and curtailment of public works projects in harmony with general economic conditions. The 1940 convention recorded approval of the USHA program and authorized a continuation of efforts to secure legislation necessary for the continuation of the low-rent housing and slum clearance programs. The Federation went on record also as favoring an integrated and sound program of defense housing to provide adequate housing facilities for industrial workers and to assure the fullest possible utilization of these facilities to meet the needs of the workers following the emergency.

Serious thought and consideration was given during the year to efforts on the part of some government officials to attack organized labor through application of the Sherman Antitrust Law to trade union activities. A history of this procedure was presented to the 1940 convention, which in turn announced the purpose of the A.F.L. to challenge this trend toward government control over the collective bargaining process through the use of anti-trust litigation.

The activities of the Federation in the field of adult and vocational education have been continued. Through the Permanent Committee on Education of the A.F.L. which functions throughout the year,

study has been made of the trends in the vocational training field through the NYA, the CCC, and other branches of the government concerned with training of workers. Special consideration has been given to training of workers for defense production and the Federation went on record as favoring a program to be developed by management and labor jointly.

Formed principally for the organization of wage earners into trade unions, the A.F.L. placed particular emphasis on such work during the year. Regional conferences for the purpose of instituting organizing drives in their respective regions were held in Atlanta, Ga., for the 10 southern States, Dallas, Tex., covering the 5 southwestern States, and Hartford, Conn., for the 6 New England States. The regional conferences were highly successful and met a two-fold purpose—they stimulated interest in organization and promoted better understanding of the policies and principles of the Federation.

In reporting on legal activities engaged in during the year, special attention was called to successful efforts in securing the voidance of the Oregon Anti-Picketing Law, nullification of the Alabama Anti-Picketing Law, as well as other legal cases which are of special importance to workers generally.

Conforming to the precedent established during the last world emergency the A.F.L. recommends that the members of directly affiliated local trade and Federal labor unions who are drafted or otherwise enter into military service shall be exempt from the payment of all local dues and per capita tax to the A.F.L. while engaged in such military service. Provisions were recommended for the voluntary continuation of benefit rights in the union by the individual should he so desire.

The A.F.L. went on record as favoring economic boycotts against the aggressor nations of Germany and Japan. With the increasing importance of Pan-American relations the 1940 convention of the Federation authorized a study into the advisability of revitalizing the Pan-American Federation of Labor and planning next steps to increase its effectiveness.

In unmistakable terms the American Federation of Labor reiterated its opposition to all forms of communism, fascism, nazism, or any other form of totalitarianism and its strict adherence to democratic principles and practices.

See COMMUNISM; LABOR CONDITIONS.

WILLIAM GREEN.

**AMERICAN LABOR PARTY.** See COMMUNISM.

**AMERICAN LEGION, The.** An organization of World War veterans, chartered by Congress in 1919. Its 22nd national convention was held in Boston, Mass., Sept. 23 to 26, 1940. The climax of the convention was a 12-hour parade, Tuesday, September 24, by 100,000 marchers before 2,500,000 spectators. The next convention will be at Milwaukee, Wis., Sept. 15 to 18, 1941.

The Boston convention resolved on the war: "We believe that a sound national defense policy for this country requires that we should at this time give all practicable aid to Great Britain and those aligned with her in their fight for freedom."

The national executive committee in Indianapolis, Nov. 21 and 22, 1940, designated the major national legislative program for 1941 as (1) national defense; (2) government protection for

World War widows and orphans; (3) civil service, veterans' preference, and employment; (4) Americanism, including further restriction of immigration, continuation of the Dies committee, and increasing of the personnel of the FBI.

Major 1940 accomplishments included:

**National Defense.** The \$17,000,000 expenditures for national defense authorized by the 76th Congress put steps in motion to substantially complete the long-sought national defense objectives of the Legion. Its defense endeavor now, according to Warren H. Atherton, Stockton, Cal., chairman of the national defense committee, will be to strive for a continuing national defense by having the present emergency measures amended to provide permanent defense.

**Americanism.** In 1940 34 boys' states were conducted in which 15,000 boys were trained in civic government 400,000 boys under 17 again enrolled in junior baseball. 62,000 students in 40 states participated in the annual high school oratorical contest.

**Child Welfare.** 30,000 volunteer workers carried on this activity. Incomplete reports showed the known total of \$4,647,682.87 was expended in emergency financial aid to 454,495 needy children during the year, mostly for food, clothing, and medical treatments.

**Rehabilitation.** A total of \$3,255,498.96 in various contested government benefits was recovered without cost to the beneficiaries, by the Legion, through its national rehabilitation service, for World War veterans and their dependents during the fiscal year ending June 30, 1940.

**Legislation.** 1940 was a banner legislative year for the Legion. It saw the commencement of a program looking toward an adequate national defense; saw most of its long-championed universal service principle enacted into law piecemeal through various emergency defense measures; made further progress with its legislation for government protection for World War widows and orphans; and the Dies committee for the investigation of un-American activities, was continued for another year, with a \$75,000 appropriation, by a 345 to 21 vote of the House of Representatives, Jan 23, 1940.

**Membership.** During 1940 the Legion reached a new high in membership. Dec. 31, 1940, there were 1,078,119 members. The posts numbered 11,115, also a new high. The Auxiliary also enrolled its highest membership, 504,299 in 9147 units. The Sons of The American Legion closed the year with 66,840 members in 3450 squadrons. The Forty and Eight membership climbed to a new peak with 43,594 members in 700 voituers. The Eight and Forty pushed to a new high enrollment of 7258 members in 277 salons.

National officers elected for 1940-41 were: National Commander, Milo J. Warner, Toledo, Ohio; Vice Commanders, Erwin A. Froyd, Torrington, Wyo., James L. McCrory, Omaha, Neb., Harold P. Redden, Springfield, Mass., Edward R. Stirling, Greensburg, Pa., and Alcee S. Legendre, New Orleans, La.; National Chaplain, Brigadier William G. Gilks, The Salvation Army, Dallas, Texas; National Historian, Thomas M. Owen, Jr., Washington, D.C.; National Adjutant, Frank E. Samuel, Indianapolis, Ind.; National Treasurer, John R. Ruddick, Indianapolis, Ind.; National Judge Advocate, Ralph B. Gregg, Indianapolis, Ind. National headquarters are at 777 North Meridian St., Indianapolis, Ind. Legislative, rehabili-

tation, and employment director offices of The American Legion are maintained in the Legion-owned building at 1608 K Street, N. W., Washington, D.C. Editorial and advertising offices of *The American Legion Magazine* are at 15 West 48th Street, New York City.

**AMERICAN NEGRO EXPOSITION.** See FAIRS, EXPOSITIONS, AND CELEBRATIONS.

**AMERICAN SAMOA.** See under SAMOA.

**AMERICAN SOCIALIST PARTY.** See ELECTIONS; SOCIALISM.

**ANDORRA.** A small republic in the Pyrénées between France and Spain, under the joint suzerainty of the French chief executive and the Spanish Bishop of Urgel. Area, 191 square miles; population, 5231. Capital town, Andorra. The language spoken is Catalan. Sheep rearing is the main occupation of the people. There is a governing body called the council-general consisting of 24 members (12 elected every 2 years) elected for 4 years by male citizens of 25 years of age or older. The council-general nominates the First Syndic (President) and Second Syndic (Vice-President). In a decree published Sept. 24, 1940, Marshal Henri Philippe Pétain, French Chief of State, assumed the title "co-prince of Andorra" formerly held by the President of the French Republic.

**ANGLICAN COMMUNION.** See ENGLAND, CHURCH OF.

**ANGLO-EGYPTIAN SUDAN.** A British-Egyptian condominium in northeast Africa. Area, 969,600 square miles; estimated population, 6,342,477 including 53,625 non-natives. Chief towns: Khartoum, the capital (46,676 inhabitants), Omdurman (110,959), Khartoum North and Rural District (107,720), Atbara (19,757), Port Sudan (18,554), and El Obeid (17,300).

**Production and Trade.** Cotton (ginned) and gum arabic (80 per cent of world's supply) are the principal export products. The chief grain crops are great millet (the staple food of the Sudanese) and bulrush millet. Other products: sesamum, cottonseed, groundnuts, dates, dom nuts, mahogany, ghee, shea nuts, salt, and gold. Livestock (1938): 2,700,000 cattle, 2,500,000 sheep, 2,000,000 goats, 420,000 camels, 75,000 asses, and 23,000 horses. Trade (1939): imports £E5,939,518 (cotton piece goods £E1,002,488, sugar £E803,607); exports (excluding re-exports of £E304,631) £E5,367,396 (cotton £3,410,080, gum arabic £E711,606). The £E(gyptian) averaged U.S. \$4.56 in 1939. Communications: 1991 route miles of railway; 2325 route miles of river transport; 5854 miles of telephone and telegraph routes. Shipping entered and cleared Port Sudan aggregated 746,591 tons in 1938.

**Government.** Budget (1939): revenue £E4,616,902; expenditure £E4,865,406. The governor-general is appointed by Egypt with the assent of Great Britain (Anglo-Egyptian Convention of 1899; reaffirmed by the Anglo-Egyptian Treaty of 1936). Ordinances, laws, and regulations are made by the governor-general in council. Governor-General, Lieut.-Gen. Sir Hubert Huddleston who succeeded Sir Stewart Symes during October, 1940.

**History.** Following Italy's entrance into the European War on June 10, 1940, the Anglo-

Egyptian Sudan became one of the minor fronts in the expanding conflict. The territory occupied a strategic position separating the large Italian armies in Libya from the Italian forces isolated in Italian East Africa (q.v.). Early in July Italian and native troops operating from Eritrea and northern Ethiopia captured the border town of Kassala (pop., about 10,000), terminus of a railway line from Port Sudan on the Red Sea and an important caravan center. Gallabat and Kurmuk, two Anglo-Egyptian posts south of Kassala on the Ethiopian frontier, were captured soon afterward. From July through October troops on both sides were largely immobilized by heavy rains and extreme heat. The British resumed the campaign on November 7 by recapturing Gallabat and indecisive fighting continued along the border for the remainder of the year.

The government of the Anglo-Egyptian Sudan early in 1940 agreed to Egypt's terms for repayment of sums advanced to the Sudan by the Egyptian Government since 1898. The total debt was fixed at £E5,414,000. Repayment was to start in 10 years at the rate of £E150,000 annually. Two high officials of the Northern Province of the Anglo-Egyptian Sudan were killed and one seriously injured on July 24 when caught by a train while crossing the Athara River bridge. They were M. A. B. Harrison, Chief Justice, and J. N. Richardson, District Commissioner (killed), and Gov. M. S. Lush (injured).

See EUROPEAN WAR under *Campaigns in Africa*; EGYPT and ITALIAN EAST AFRICA under *History*.

**ANGOLA.** A colony in west central Africa, belonging to Portugal. Area, 487,788 square miles; population (1936), 3,484,300 including 59,000 Europeans and 21,800 half castes. Chief towns: Nova Lisboa (Huambo), the capital; Loanda, Benguela, Mossamedes, Lobita, and Malange.

The chief crops (with outputs for 1937-38, in metric tons) are maize (260,500), sugar (32,500), coffee (14,300), wheat (10,600), palm oil (3000), palm kernels (2600) Cacao, sisal, cotton, and tobacco are other crops. Wax is an important product. There are rich deposits of diamonds. Copper and lignite exist but are not mined. Salt has been found. In 1938 (values in old U.S.A. gold dollars), imports totaled \$6,000,000 (textiles, foodstuffs, and coal were the chief items); exports, \$8,800,000 (diamonds, maize, and coffee were the main exports). The greater part of the ocean-carrying trade between Angola and Europe is in the hands of a Portuguese company.

Budget: (1940) 256,506,396 angolares; (1939) 255,990,232 angolares. The colony is divided into 5 provinces and 14 administrative districts (decree of May, 1934). Governor-General, Dr. Márquez Mano (appointed Feb. 10, 1939).

On Aug. 4, 1940, 1000 Portuguese troops sailed from Lisbon to reinforce local defense units in Angola. The troops were dispatched immediately following British charges that numerous German agents had assembled in Angola for the apparent purpose of seizing control of the Belgian Congo.

**ANTHROPOLOGY.** Neandertal Man in Central Asia. One of the most outstanding and important discoveries in the field of Early Man was made in the latter part of 1938 in Uzbekistan by A. P. Okladnikov, a young Russian scientist, assisted by his wife. It consists of the find, in the Teshik-Tash cave in southwestern Uzbekistan, about 10 miles from the small town of Baisun near the Afghan border, of the remains of a Neandertal-type child, with mousterian-like implements and bones of various animals. The skeletal parts of the child, probably a male and about eight years old, had largely decayed, but the skull, though in fragments, was practically complete. These remains were brought to the Anthropological Museum at Moscow, and there completely reconstructed. The result is the most complete, characteristic, and in general the best skull of the Neandertal type thus far recovered. The specimen has been cast and the first replica of it, a faithful reproduction of the original, has been donated by the Soviet authorities to the U.S. National Museum. In 1939 a preliminary report on the find was published in the U.S.S.R., and in 1940 the essentials were published in this country.

The important points about the find, briefly stated, are: (1) It was made in an undisturbed cave; (2) it was recovered with due care by a scientific worker; (3) the find showed prolonged occupancy of the cave but was not complicated by intrusions subsequent to the burial; (4) the lay of the skeleton and the arrangement of the large wild goat horns about it indicated clearly a regular burial; (5) the skull, when ably reconstructed, is practically complete with nearly all the teeth and the lower jaw, undeformed, and typically Neandertaloid for its age; and (6) the find extends the realm of the Neandertal Man far to the eastward of his formerly known territory. As to chronology, it is probable that the find may be referred to the upper part of the Neandertal phase.

**The Pithecanthropus—New Remains.** In December, 1939, G. H. R. v. Koenigswald, a Dutch geologist, and Dr. F. Weidenreich, the well known anatomist and anthropologist, report briefly in *Nature* (Dec. 2, 1939, 926-9), on the latest finds attributed to the Pithecanthropus. The previous remains claimed to belong to this highly important form, aside of the original ones of Dubois, were a juvenile skull (*Homo modjokertensis*, 1936); portion of a lower jaw (Sangiran, 1936); and a defective skull, with a fragment of another (Sangiran, 1937). To this is now added, also from Sangiran, a large portion of an adult maxilla with teeth, and the posterior half, roughly, of a skull of seemingly the same individual. A detailed account of these latest discoveries is still wanting. But they have already given rise to much speculation. The two specimens, which, thanks to Dr. Weidenreich, could be examined by American anthropologists in the original, with good casts since available, are very striking. The upper jaw, evi-

dently that of a young adult male, surpasses both in size and primitiveness everything seen hitherto in early human remains. The teeth are large, there are definite symmetric diastemæ in front of the canines, the second molars are considerably the largest, and the lateral parts of the alveolar arch are straight and diverging backwards; but the canines are already of subdued prominence and the form of the crowns is close to human. The skull is striking by its internal smallness and lowness as well as other primitive characters. The ensemble of the two specimens represents a being partly already human, partly still simian, a veritable intermediary form, a precursor, a "paranthropus" (Montandon). Identification of this form with the *Sinanthropus* (Le Gros Clark, et al.), when the specimens themselves are seen, appears wholly impossible.

**Early Man in Italy.** In March of 1940 an outstanding find of further remains of early man was made in Italy. It was a remarkably well preserved adult skull, with its lower jaw and most of the teeth, recovered in a cave at Mount Circe, 50 miles south of Rome, facing the Mediterranean. The skull was found during excavations in the cave—one of a network—for new foundations of a small hotel and a wine depository. The specimen, reported to be the fourth from the Neandertal period and the second of the promontory, is very well preserved, though it shows a fracture of the right temporal region, which had probably been the cause of death of the individual. The cave yielded also numerous broken bones of prehistoric elephants, rhinoceroses, large horses, deer, bears, panthers, hyenas. The cave had been sealed in times far past by a landslide, so that its contents were not disturbed. The skull lay alone in a wide space within a crude circle of stones, indicating that it probably was either a trophy, or used for some ceremony. A credit is due to the owner of the hotel who, upon the discovery and before anything was moved, notified scientific authorities who recovered the specimens, which are now in Rome. The cave itself has been closed in reserve for further exploration.

**Ritual Ablation of Teeth in Siberia and America.** Common in Africa, Australia, and some other parts of the world, ceremonial removal of the front teeth has hitherto almost failed to be noticed in America or Siberia; but a special study of the subject, on large materials, shows definitely that the practice of removing some of the front teeth was widely spread from prehistoric to fairly recent times over both Siberia and America. In pre-Columbian America, in fact, it appears to have been almost, if not quite, universal. In Siberia and Japan it existed from the neolithic period, if not earlier, and was in all probability brought by the migrants of that period to the American continent. The removal of the teeth, according to all indications, took place early in life, but not in childhood—the numerous skulls of children up to 10 years of age in the collection at the U.S. National Museum show no case of the ablation. As to the teeth removed, there was a wide variety. The ablations were done generally in both sexes, though mostly they are found in a more or less larger proportion

of the males. The practice differed in the various tribes, the removal of certain teeth having evidently been more favored in some groups than in others. The actual ways of removal of the teeth in all probability differed, including knocking out, prying, and especially pulling with sinews, or a combination of these efforts. The meaning of the ritual ablation could only have been sacrificial, with secondarily a test of endurance. The removals were undoubtedly practiced by other persons, relatives or shamans. The extraction, if of but one tooth, caused presumably but little inconvenience. The ablations, curiously, though differing considerably in frequency in different groups, were never universal. In most of the tribes or localities they were in fact rather rare, affecting but a few per cent of the individuals. There evidently was some selection, based perhaps on clan or other form of social organization. The similarity, and to a large extent contemporaneity, of this complex ritual practice forms one more link that connects the Asiatic and American native peoples.

**The Irish: Physical Characters.** Recent anthropological survey of Ireland under the auspices of Harvard University, extending to over 10,000 individuals, has shown the following main results:

(1) *The Western Peninsula:* West Donegal, Mayo, and Kerry (including parts of Clare and Cork). This region finds the association of tall stature, sub-brachycephaly, dark hair, and mixed eyes. It is strongly Gaelic in speech and possibly includes the largest numbers of the Mesolithic stock which first settled Ireland from Scotland.

(2) *The Central East Coast:* The shortest and most dolichocephalic region with highest concentration of light eyes (especially blue eyes), but very dark hair. Perhaps this may be the area settled by the Megalithic people who sailed up the Irish Channel.

(3) *The Blond Crescent* (with its horns at Sligo and Galway Bays and its convexity at Longford and Westmeath): In its belly it is the blondest area in Ireland, in the southwest horn (West Galway and the Aran Islands) it is the tallest and almost the longest-headed area in Ireland. All of this area is notably characterized by grayish and light mixed eyes rather than pure blue eyes. It seems to be peopled by a majority of Predominantly Nordic and Nordic peoples.

**Reference.** Hooton, E. A., 1940 *Am. Jour. Phys. Anthropol.*, xxvi, pp. 229-49.

**The Criminal.** Crime is not physical. It is mental. It is not due to disorders or even abnormalities of the body, but partly to acquired antisocial habits, partly to brain, nervous system, and the internal glandular system disorders. The criminal "facies" of whatever sort is not inborn, but acquired through the criminality and the reactions of the criminal with other people. Except for brute violence and actions due to brain disorder, crime itself is no organic entity, but is a social phenomenon differing vastly individually in degree and shadings; and there is probably no living individual who has not at some time transgressed some human as well as a natural law, or who would not transgress such if confronted with sufficiently incitive conditions.

**Reference.** Hrdlička, A., 1939 (Oct.) *Jour. Crim. Psychopath.*, i, 87 et seq.

**Great Apes: Blood Groups.** The possession by the anthropoid apes of blood-group factors ap-

parently identical with those of man is a very significant indication of the close relationship between the two stocks. Of all the somatic and physiological characters common to both, only in the instance of the blood groups is the mechanism of inheritance completely understood. Further, since the blood groups have no intrinsic value, and are not linked to any known character, they can neither have affected, nor been affected by the evolutionary adaptations which resulted in man and the anthropoids. For this reason, the serology of the apes is of great interest in connection with the problem of the origin of man, and his subsequent spread.

Previously published results showed the chimpanzee to have the O and A factors, the orangutan and gibbon the A and B factors, while the four known gorillas were all group A. In spite of the small number of gorillas tested, some sweeping conclusions were drawn from the supposed absence of B in both African anthropoids.

By means of tests upon the urine the groups of 14 additional apes, including 7 gorillas have been determined. The B factor was demonstrated in the 5 lowland gorillas in the series, while the 2 mountain gorillas were found to be group A.

The results obtained from the urine have been confirmed in 6 of the 14 individuals by tests upon the blood, and in one case by tests upon the salivary glands.

ALES HRDLIČKA.

**ANTIGUA.** A West Indian island (108 sq mi) which, with its dependent islands of Barbuda and Redonda (63 sq. mi.), is one of the presidencies of the British Leeward Islands. Total population (1938), 35,123. St. John, the capital (10,000 inhabitants), is the capital of the British Leeward Islands. Sugar and cotton are the chief products. Trade (1938). imports £253,669, exports £200,357. Finance (1938). revenue £102,501; expenditure £97,597; public debt £83,674. Antigua, in addition to representation in the federal legislative council of the Leeward Islands, has a local government consisting of an executive council (presided over by the governor) and a legislative council (3 official, 3 nominated, and 5 elected members) of which an administrator is president. Administrator, H. Boon (appointed Apr. 2, 1940).

**History.** Antigua was one of various British possessions in the Western Atlantic in which air and naval bases were leased for 99 years to the United States in exchange for the transfer of naval and military equipment to the British government (British-United States Pact of Sept. 2, 1940). The base sites agreed upon in Antigua were announced Nov. 18, 1940, as follows: (a) An area in Parham Sound, opposite Long Island, beginning about 2¼ miles north of Parham and measuring about 2¾ miles by 1 mile; (b) the narrow peninsula known as Crabs on the east side of Parham Harbor measuring about 1 mile long and ¼ mile wide. Preliminary work on the bases was begun soon afterward. On December 9 President Roosevelt personally inspected the base sites and conferred with the island's officials.

See BRITISH WEST INDIES.

**ANTIMONY.** The United States consumption of antimony is normally about 10,000 tons per

year, but this figure was substantially increased in 1940 in consequence of war demands. The price was stable at 14¢ a lb. throughout 1940, and a plentiful supply of metal was available. The United States continued to import ores from Mexico to supplement limited domestic production, all of which was smelted at Laredo, Texas. Although the Japanese war interfered somewhat with production from China, substantial shipments were received from that country, and the United States created a considerable stockpile. The United States advanced large loans to China, which will be liquidated in time by shipments of tungsten ore. The principal uses of this metal continued to be for hardening lead, and as oxide for enameling steel sheets for refrigerators, washing machines, and other pieces of equipment. No statistics are available on production, imports, and consumption.

H. C. PARMELEE

**ANTISEMITISM.** See FASCISM; JEWS.  
**ANTI-TRUST INVESTIGATIONS AND PROSECUTIONS.** See AMERICAN FEDERATION OF LABOR; MEDICINE AND SURGERY; UNITED STATES under *Prosecutions*. See MONOPOLIES.

**AQUEDUCTS.** Two general classes of aqueducts include (1) those for irrigation and power purposes, and (2) those for municipal or domestic water supply. Many aqueducts of the first class (canals, flumes, tunnels, and pipe lines) are included in the numerous projects of the U. S. Bureau of Reclamation (q. v.). An example is the 40-mile Provo River aqueduct from the Deer Creek dam to Salt Lake City, Utah, which was completed in 1940. With 36 miles of concrete and steel pipe and four miles of tunnels it is to serve both for irrigation and domestic supply.

In connection with its irrigation projects, the Bureau built 343 miles of canal aqueducts during the year ending June 30, 1940. Outstanding among these was the 80-mile All-American canal in California, which replaces the old canal lying partly in Mexico. It is by far the largest irrigation canal in this country and carries water from the Colorado River at the Imperial dam and reservoir to the rich Imperial Valley in southern California. Under construction are the 140-mile Coachella branch of the All-American canal, and five other aqueduct canals from 30 to 100 miles in length. The Bureau is also making surveys for a proposed aqueduct in Arizona, from the Parker Dam reservoir on the Colorado River to the neighborhood of Phoenix, to provide irrigation for some 700,000 acres on the central elevated plateau which has suffered from prolonged drought. The aqueduct, partly in tunnel, would be nearly 200 miles long and would require a pumping lift of about 1100 ft.

Of the greater aqueducts for municipal water supply, the Metropolitan Water District of Southern California completed its main aqueduct (from the Colorado River to Lake Matthews) in 1939, and by the middle of 1941 it will have completed the distribution system of 156 miles to serve some fifteen cities within the District. Of the 398-mile total, 28 per cent is in tunnel, 16 per cent in canal, and 56 per cent in pipe lines. On the main aqueduct, the pumping lift, in five stages, is 1617 feet. The Mono Basin extension of the Los Angeles water supply aqueduct, which was put in operation on Jan. 1, 1941, includes the 11.3-mile Mono Craters tunnel, three intake structures, a storage reservoir, three tunnels aggregating 1¼ miles, a mile of 86-in. steel pipe, and 9 miles of concrete conduit.

Foremost among aqueducts for individual cities is the 85-mile rock tunnel for pumping water from the Delaware River to New York City. It is to be completed in 1945, but in December, 1940, the excavation was finished for 92.8 per cent of the distance, the concrete floor or invert for 40.6 per cent, and the concrete sides and arch for 22.8 per cent. With the city extension, already in use, the tunnel length will be 105 miles, all in rock, and proposed extensions or branches to new watersheds may increase this to 137 miles. An underground river, encountered in the main tunnel, was presenting serious engineering difficulties at the close of the year.

A series of aqueducts in the water supply system of Boston, Mass., has been enlarged by the pressure aqueduct put in service on Oct. 23, 1940, which practically parallels three older aqueducts in which the flow is by gravity. Its 18-mile length from the Wachusett reservoir to the Norumbega reservoir is made up of three miles of tunnel 14 ft. in diameter and 15 miles of 11½-ft and 12½-ft. concrete pipe. The next step will be a pressure tunnel extension to the Chestnut Hill reservoir and ultimately (1942-45) a deep-level pressure tunnel looping around the city. At Baltimore, Md., the new Gunpowder Falls and Montebello tunnel aqueduct from the enlarged Loch Raven reservoir, was put in service Dec. 23, 1940. It is 12 feet in diameter, with lining of concrete for 66 per cent of the length and continuous welded-steel lining for the remainder.

Several cities of moderate size have found it necessary to build aqueducts for bringing additional water supply from new or distant sources. In 1940, Grand Rapids, Mich., completed its 31-mile pipe-line aqueduct from Lake Michigan for a supply of soft water instead of the hard Grand River water. An intake of 54-in. welded-steel pipe extending 6200 ft. from shore was floated into place in 120-ft. lengths to be sunk into a dredged trench and connected by divers. At the shore pumping station begins the 31-mile pumping main of 46-in. reinforced-concrete pipe. This project, costing \$4,100,000, includes two pumping stations and two reservoirs. A similar aqueduct put into service on Sept. 1, 1940, is a 30-mile line of 48-in. concrete-lined cast-iron pipe laid in trench across country to bring water from a group of new wells to the city of Wichita, Kan.

In the same class is a third project, to be put in service in 1941, bringing to Toledo, Ohio, a supply of good water from Lake Erie to replace the old and unsatisfactory supply from the Maumee River. An intake crib in the lake serves a line of 108-in. reinforced-concrete pipe extending 2¼ miles to the shore pumping station, from which a line of 78-in. steel pipe, with bituminous coating, extends nine miles to a purification plant. From the reservoir at this plant, a steel pipe line, decreasing from 72-in. to 48-in. in diameter, runs five miles to the city to connect with the distribution system. This project will cost about \$10,000,000.

E. E. RUSSELL TRATMAN.

**ARABIA.** A large peninsula in southwestern Asia. Area, 1,000,000 square miles; population, said to be 10,000,000. For the various divisions of Arabia see below. Arab countries outside the Arabian peninsula are presented in the separate articles on EGYPT, IRAQ, PALESTINE, SYRIA AND LEBANON, and TRANS-JORDAN.

**Aden.** A British crown colony at the south-

ern tip of Arabia, about 100 miles east of the Red Sea. Included in the colony is the island of Perim (5 sq. mi.; pop., 2346) in the southern entrance to the Red Sea. Total area, 80 square miles, total population (1931), 48,338 excluding the military forces. Aden has a fortified naval base, a free port, and is a fueling station for ships. Early in 1940, because of the war, the port was made a contraband control base for shipping. Salt, soap, cigarettes, cured fish, and dhows are produced. Trade (1938): imports Rs83,170,441; exports Rs42,991,994 (rupee averaged \$0.3659 for 1938). In 1938, 2079 ships aggregating 8,650,411 tons (net) entered the port. Finance (1938-39 estimates): revenue Rs1,890,000; expenditures Rs1,743,000. The colony is administered by a governor aided by an executive council of five members. Governor and Commander-in-Chief, John Hathorn Hall (appointed Oct. 23, 1940).

**Aden Protectorate.** The region in southern Arabia extending east, north, and west of Aden. It includes the island of Socotra (1400 sq. mi.; pop., 12,000). Area, 112,000 square miles; estimated population, 600,000. The chief products are dates, gums, tobacco, and butter. Cattle, goats, and sheep exist in large numbers. The mainland includes a large number of tribal areas, the chiefs of which have treaty relations with Great Britain. Control of the country rests with the governor of Aden who is aided by a number of political officers. The area known as the Hadhramaut owes allegiance to the Qa'aiti dynasty represented by the Sultan of Mukalla. British Resident Adviser to the Sultan of Mukalla, G. A. Joy.

**Bahrain Islands.** The chief islands of this group in the Persian Gulf are Bahrain, Muharraaq, Nebi Saleh, and Sitra. Area, 213 square miles, population, 120,000. Capital, Manama (on Bahrain). Pearls, crude oil (1,044,000 metric tons in 1939), boats, sailcloth, and reed mats are the chief products. Trade (1937-38): imports Rs20,920,260; exports (excluding oil) Rs12,042,910 (rupee averaged \$0.3659 for 1938; \$0.3733 for 1937). Ruling Sheik, Sir Hamid bin Isa al Khalifa who is in treaty relations with Great Britain.

**Kuwait.** An Arab state south of Iraq. Area, 1930 square miles; population, 50,000, exclusive of some Bedouins. Capital, Kuwait. Pearls, wool, dhows, and horses are exported. Trade (1937-38): imports Rs5,477,488; exports Rs2,320,075 (rupee averaged \$0.3659 for 1938, \$0.3733 for 1937). Oil was discovered during 1938. Kuwait is in treaty relations with Great Britain, which is represented by a political agent. Ruling Sheik, Sir Hamed ibn Jabir al Subah.

**Oman.** An independent state in southeastern Arabia. The port of Gwadar on the coast of Baluchistan is owned by the state of Oman. Area, 82,000 square miles; estimated population, 500,000, mostly Arabs, but there is a strong infusion of Negro blood along the coast. Muscat, the capital, had 4200 inhabitants; Matrah, 8500. Chief products: dates, pomegranates, limes, and dried fish. Trade (1937-38): imports Rs4,176,125; exports Rs3,299,015 (rupee averaged \$0.3659 for 1938; \$0.3733 for 1937). During 1938-39, shipping aggregating 242,782 tons entered and cleared Muscat, the only port of call for steamers. Sultan of Muscat and Oman, Sir Saiyid Said bin Taimur (succeeded Feb. 10, 1932).

**Oman, Trucial.** The Arab states (Abu Dhabi, Ajman, Debai, Shargah, Ras al Khaimah, and Umm ul Qawain) on the Persian Gulf. Area,

6023 square miles; population, 75,000 to 85,000. Chief capital, Abu Dhabi. Pearls are the chief export from the coast ports. The rulers of the six states are in treaty relations with Great Britain, which is represented by a resident agent who is under the control of the British political resident at Bushire, Persia.

**Qatar.** An Arabian sheikdom occupying a peninsula in the Persian Gulf. Area, 8500 square miles; population, 25,000. Capital, El Beda. Relations with Great Britain are regulated by the Treaty of Nov. 3, 1916. Sheik, Abdullah ibn Jasim eth Thani (acceded in 1913).

**Saudi Arabia.** An Arab state occupying the northern and central part of Arabia, formerly known as the Kingdom of Hejaz and Nejd. Pending the introduction of a single constitution for the whole country, there are two systems of government—one for Nejd and one for Hejaz. Ruler, King Abdul Aziz ibn Abdur Rahman al Faisal al Saud.

Nejd includes the Nafud and Dahna deserts and has an area of some 800,000 square miles. Population (estimated), 3,000,000. Chief towns: Riyadh (capital), Hufuf, Mubarraz, Shaqra, Anaiza, Buraida, Hail, Jauf, Sakaka, and Hauta. Chief products: dates, wheat, barley, fruit, hides, wool, clarified butter, Arab cloaks, and crude oil. Large numbers of camels, horses, donkeys, and sheep are raised. Trade imports include piece goods, sugar, coffee, tea, and rice; exports, except for crude oil, are very small. Nejd is governed in a patriarchal manner by the King whose eldest son (Emir Saud) acts as Viceroy.

Hejaz extends along the western coast from Trans-Jordan to Asir. Area, 150,000 square miles; population (estimated), 1,500,000. Chief towns: Mecca, the capital and holy city of Islam, 80,000 inhabitants; Jidda, the seaport for Mecca, 30,000; Medina, the site of Mohammed's tomb, 20,000; Yenbo, the seaport for Medina. Chief products: dates, butter, honey, fruit, wool, and hides. The annual pilgrimage of Moslems from abroad to Mecca and Medina is the chief source of income. Hejaz is governed under the constitution of Aug. 26, 1926, and later amendments. There is a council of ministers presided over by the King's second son, Emir Faisal, who is minister of foreign affairs, and Viceroy during the King's absence.

Asir, a province south of the Hejaz, was incorporated in the kingdom of Saudi Arabia during 1933. Area, 14,000. Capital, Sabiya, 20,000 inhabitants.

**Yemen.** An independent Arab kingdom in southwestern Arabia. Area, 75,000 square miles; population, 3,500,000. Chief towns: San'a (capital), 25,000 inhabitants, Hodeida, 40,000, Taizz, Ibb, Yerim, Dhamar, Mocha, Loheiya. Chief products: coffee, barley, wheat, millet, and hides. Ruler, King Yahya Muhammed Hamid ed Din.

**History.** Italy's entrance into the European War (q.v.) on June 10, 1940, drew the Arabian peninsula toward the vortex of the conflagration. The Italians conquered British Somaliland fronting Arabia's southern coast on the opposite shore of the Gulf of Aden, waged air and sea warfare in the Gulf of Aden and the Red Sea, made repeated air raids upon the British base at Aden, and attacked the Arab countries of Egypt and Palestine. On October 19 Italian planes made a long-distance raid on American-owned oil refineries of the Bahrein Islands but reportedly did little damage.

King Ibn Saud of Saudi Arabia and the Imam Yahya of Yemen maintained the neutrality policies proclaimed at the outbreak of the war, despite efforts of German and Italian agents on the one hand and British agents on the other to obtain their support and collaboration. The pro-British sympathies with which most of Arabia viewed the war were strengthened by the successful defense of the British Isles and Egypt and by the Italian air attacks upon Arab populations in Egypt, Palestine, Aden, and the Bahrein Islands. Early in the year two leading British authorities on Arabia, W. H. Ingrams and Freya Stark, were sent to Aden to direct political work in Italian East Africa, French Somaliland, and among the tribes of Southern Arabia. They opened a new broadcasting station at Aden.

King Ibn Saud strengthened his army and air force during 1940 with funds obtained from United States oil interests in 1939 (see 1939 YEAR BOOK). A new air base was established at Riyadh early in January. He also tightened his kingdom's bonds with Iraq and Egypt and took a prominent part in the negotiations for the establishment of an Arab federation that were carried forward in the various Arab capitals during the year. Gen. Nuri Pasha es-Said, Foreign Minister of Iraq, flew to Saudi Arabia early in April for a four-day conference with Ibn Saud. They issued a communiqué stating that the two countries had agreed on a policy of mutual collaboration in promoting Arab interests. The Egyptian Government, in another agreement with Ibn Saud, undertook to meet the major part of the cost of the modern highway under construction from the Red Sea port of Jidda to Mecca, designed primarily to facilitate Moslem pilgrimages to Mecca.

The United States showed increased interest in Saudi Arabia as a result of the rapid development of the oil industry and the influx of American technicians and other oil-field workers. Diplomatic relations between Saudi Arabia and the United States were established for the first time on Feb. 4, 1940, when the American Minister to Egypt presented his credentials as Minister to Saudi Arabia. There were estimated to be 500 United States citizens in the Arabian peninsula (273 in Saudi Arabia).

**ARBITRATION, Labor.** See LABOR CONDITIONS; NATIONAL LABOR RELATIONS BOARD; AUSTRALIA, CANADA, CHILE, DENMARK, GREAT BRITAIN, and NEW ZEALAND under *History*.

**ARCHAEOLOGY.** The European war has had a very depressing effect upon archaeological exploration, since the normal fields for this work are those in which the war is actually being carried on—Egypt, Asia Minor, Mesopotamia, and the Mediterranean world. However, enough happened prior to the outbreak of hostilities to make it worth while to record it.

**Egypt.** Without doubt the most noteworthy discovery to be recorded in Egypt is the finding of the tomb of Psousennes I, the father of King Amenemhet. This took place at San el-Hagar in the delta of the Nile, near the city of ancient Tanis. The removal of a large block of pink granite set in the west wall of King Sheshonk's tomb brought to light an opening that led into a corridor that gave entrance to the funerary chamber of Psousennes I, the second king of the 21st dynasty. At the end of this room, which measured about 10 by 23 feet, was found a great granite sarcophagus with funerary material scattered on

the floor in front of it. The sarcophagus itself was covered with reliefs, and on the cover was a reclining figure of the king represented as Osiris. At his head knelt a goddess with outstretched protecting arms. The sarcophagus enclosed another mummiform sarcophagus, also of granite, which carried the likeness of the king.

Within the second sarcophagus was a third, in excellent condition, seven feet in length and beautifully wrought in the likeness of the king. This silver coffin in turn contained a silver-gilt body-cover carrying long inscriptions. Besides this there was a mask of gold. Underneath the mummy, which, on account of the dampness was badly preserved, a considerable amount of fine jewelry was found, which taken together with other treasure makes this find one of the most important yet made. Perhaps the most interesting piece of jewelry found was a necklace made up of two heavy bars of gold supporting a massive golden lotus as a centerpiece. Not the least interesting was another necklace composed of lapis lazuli with clasps of gold which bore an inscription boasting that the king had had a necklace created that would never be equaled. This necklace weighed the astonishing amount of 72 pounds.

There is reason for thinking that this king was the father of the wife of King Solomon (I Kings III, 1). The king's mother was Queen Mutnejem and his uncles Pyander and Pynojem.

In a chapel of King Psousennes' tomb was discovered the mummy of King Amenemhet, his son and successor. It is probable that the body had been brought here from some other place. The entrance to this chapel had been sealed with a great block of granite 6½ feet in height. On it appears a figure of Amenemhet pouring a libation of holy water to Isis and Osiris. On the king's sarcophagus was an inscription giving his name. Some previous name had been erased suggesting that the coffin had originally been created for someone else. Near the sarcophagus was discovered an alabaster jar filled with earth—probably sacred earth from Thebes. This is the second time such a find has been made at Tanis.

The body of Amenemhet reposed in a wooden coffin to which had been nailed a gold cover. At the head of the coffin was a gold mask of the king. Within the coffin in the debris were found another gold mask, and bracelets as well as other ornaments. On the breast of the mummy was a gold pectoral set with semi-precious stones and showing Isis and Nephthys in the act of worshipping a scarab sun. In the coffin also was discovered a monkey's head carved from chalcedony and mounted upon a heart. Two interesting gold bracelets found on the upper arm displayed flying scarabs between cartouches bearing the name of King Psousennes, suggesting that they were a gift from that king.

**Mesopotamia.** In the royal palace at Mari in Mesopotamia some 20,000 clay tablets have furnished the names of a number of petty kings who ruled in northwest Syria and Mesopotamia. Six Hurrian tablets reveal that they are 500 years earlier than the material found at Boghazköi or Ras Shamra.

**Cyprus.** At Lefka on the island of Cyprus on the hill of Apliki, which rises from the right bank of the Marathasa river, the Cyprus Mines Corporation has uncovered evidence of Bronze Age occupation. The digging of trenches in the hill brought to light Roman galleries and shafts and a

heap of slag at the foot of the hill. At the southern end of the hill were discovered ancient shafts and dumps. Here appeared traces of several houses dating in the Bronze Age. From these were recovered many sherds and tools of stone.

The most interesting part of the find were the houses which covered the slopes of the hill. At one place was found a house built on two levels. In the lower was a large storeroom. As originally planned this house had three rooms which had been hewn out of the rock of the hill. In front was a veranda. The walls of the structure had been built of mud brick covered with a thick coat of plaster. The floors were of lime cement. The roof was flat and supported by upright posts. The roof itself was made of a layer of brushwood covered with a thick coating of red earth taken from nearby dumps. The storeroom referred to was underneath the veranda and contained large jars placed side by side. They were about the height of a man. Back of the house a passageway had been cut from the native rock to give access to a neighboring dwelling. From beneath the floors of the house were recovered sherds of white slipware II (so-called milk bowls) and some Mycenaean ware which prove that the house was built at the height of the Mycenaean period in Cyprus—that is, near the close of the Late Cypriote II Period (c. 1350–1300 B.C.).

One of the most important finds on this site, inasmuch as it reveals complete familiarity with the craft of smelting, consisted of nearly a sackful of slag, which was uncovered near the hearth. The house appears to have been abandoned as the result of a fire, perhaps occasioned by the overturning of a lamp which set fire to baskets of grain standing on the floor. The objects found in this debris date in the Late Cypriote IIb (c. 1225–1100 B.C.).

**Greece.** In Athens the chief interest still centered in the American School's excavations on the site of the ancient agora. Because of the uncertainty of the political situation the campaign was only of five weeks' duration and, at that, late in starting. The short period of time devoted to this work was the result of the necessity of evacuating the staff before the Mediterranean was closed by the war to American shipping. Most of the excavators' efforts were concentrated on a further clearing of the Museum site. The clearing of a 6th century B.C. cemetery which had been partially uncovered in 1939 was completed. From three untouched burials were recovered considerable material of the second half of the 6th century in the form of black-figured vases of various shapes. The clearance of the great drain and other water channels in this area brought to light an additional number of ostraka. The most interesting of the lot was one bearing the name of the great Pericles. It appears to have been cast in the balloting of the year 443 when his rival Thucydides, son of Melesias, was exiled. Another ostrakon bearing the famous name Alcibiades was also recovered, but in this instance it appears to be the name of Alcibiades the younger and refers to the balloting of the year 417 when Hyperbolos was ostracized.

From such material much important information has been recovered. Thus, this year the excavators found an ostrakon bearing the name of Kallixenos, the son of Aristonymos. The inscription of this ballot was scratched on the inside of a red-figured vase, and since the 90 ostraka bear-

ing this man's name have usually been found in connection with those of Aristides and Themistocles and probably cast in the balloting of the year 482, it must be clear that the style of this vase, which had been broken to bits at this time, must belong to this period.

Still another important discovery of this year's campaign is that of a large disk of white poros showing a relief carved in the style of the late 5th or early 4th century. The disk is something over  $\frac{1}{4}$  meter in diameter. The relief shows two figures. At the left is a woman seated upon an elaborate throne, the legs of which are turned and the arm supported by a winged beast. The woman is clad in an ample garment draped around her in graceful folds. One end of the garment she holds above her left shoulder with her left hand while her right, resting in her lap, holds a cornucopia. Undoubtedly this figure is the goddess Demeter. Opposite to her stands Poseidon with his right foot resting upon a rock. He supports a large trident in his right hand. Between the two deities is visible the gnarled trunk of a tree. The scene represents Demeter presenting the fig tree to Poseidon, memorialized in the shrine of the sacred fig tree situated near the bridge over the river Cephisos on the way to Eleusis.

From a well of the Hellenistic period came a marble statuette of a woman, especially interesting because it preserves considerable traces of color. The figure wears a chiton of olive green and a heavy mantle of lilac with bands of bluish green. The base of the column on which the figure rests its right hand is painted red with red and black bands on the top and bottom of the shaft.

Another Hellenistic deposit produced a hoard of 113 coins all but two of which are of bronze and issued by Athens, Aegina, Chalcis, Eleusis, Larissa, Megara, and Phocis. They all fall within the period 350-250 B.C. One of the two silver coins was struck by Lysimachus of Thrace after 306 B.C., the other was issued by Demetrius Poliorcetes between 306 and 283 B.C. This find is of especial interest because the coins of Athens and Eleusis establish a chronology previously lacking.

Besides working on the Museum site the excavators devoted close attention to the north slope of the Acropolis to the west of the Mycenaean tomb discovered in 1939. Here were found late Mycenaean remains including a complete hydria found in a rectangular cutting in the bedrock under the floor of the forecourt of the Klepsydra.

Italy. In Italy several discoveries have been made. At Fiume an incineration burial gave up a fine bracelet with silver pendants. At Epizephyrian Locris was found a rich hoard of votive terra cottas belonging to the 4th and 3d centuries B.C. They represent nymphs, Nereids, Pan enthroned, and a small shrine in the form of a grotto. The campaign this year on the site of the Heraion in Lucania was devoted to an area about 400 meters southeast of the larger of the two temples. Digging has revealed that three architectural periods can be distinguished. This site lies outside the sacred enclosure and the principal and central feature is a building measuring 8.50 by 6.64 meters, with a platform to the west which can be dated in the 4th century B.C. The walls of the structure are preserved to a height of about 1.33 meters. In the construction of this building material from older structures was taken. In it were found many cornice blocks showing two different types of mouldings, 18 metopes with figures in relief which

once belonged to the Doric frieze of the archaic treasury, and two sculptured metopes from an older structure which was erected about 500 B.C. The sculptures are mostly well-preserved and of high quality. The metopes preserved constitute a group without precedent and give us an unexpected documentation of the systems of archaic sculptors in treating the most ancient repertory of myths, such as the Trojan cycle, the Labors of Hercules, and the Centauromachy. In this work we have before us the work of a school of sculpture which began in the first half of the 6th century B.C. and flourished for about half a century.

At Milan excavations for a new building near the church of San Carlo uncovered at a depth of about 13 feet an important group of some 10 Roman wells built of brick. They were about 10 feet apart and 3 feet in diameter. The lowest layer of bricks rested upon a base of walnut wood.

Near the church of San Vincenzo in Prato, also in Milan, digging revealed that here was a suburb just outside the city. Abundant remains of buildings were uncovered. Particularly noteworthy was a long stretch of excellently constructed wall which rested upon a foundation of piles. Still in Milan excavations near the church of San Giovanni in Conca uncovered a deep well which contained a system of lead pipes inserted in a large block from the trunk of an oak tree. Between two pipes which were about 10 centimeters in diameter a square hole had been cut in the block probably to house the key with which the water could be shut off. Owing to the moisture of the ground this water main was almost uninjured.

At the important site of ancient Ostia has been found a herm of Themistocles which has been identified by its inscription. Also found were two fine portrait heads, one of which wears a veil. At Pola work on the site of the Roman theater of the Capitolium has revealed part of the hyposkenion and some interesting details of the *frons scaena*, while nearby was found the beginning of an inclined paved street which gave access to the theater zone.

At Pompeii, Mauori has examined several parts of the southwest edge of the city, especially the precinct believed related to Venus Pompeiana. Excavations have revealed that it rests upon a completely artificial terrace. During the work of clearing away the deposit of previous dumping was found a beautiful veiled head which may represent Marcellus, the nephew of Augustus.

At Rome excavations on the Capitoline hill have brought to light further details of the Tabularium, as well as the underground passages, podium, and the colossal cult statue of the temple of Veniovis. Also a massive early Doric capital turned up; it may have come from one of the great temples of the Capitoline. In addition to this were found remains of pavements and walls which antedate the time of the Tabularium.

Central America. In America this past year considerable has been done in the way of exploration in Central America. For the Carnegie Institution Gustav Stromsvik continued his excavations on the acropolis at Copan. On this site work on the two temples which stand on each side of the ball court has supplied information which is of assistance in making a partial restoration of the place. In the peninsula of Yucatan, Pollock and Shook were busy for about four months in the area lying to the south and east of the so-called

#### MONOLITHS FROM THE MEXICAN JUNGLES

Three of the great stone figures excavated in the coastal region near La Venta, southern Vera Cruz, by the National Geographic-Smithsonian Institute Expedition of 1940, led by Matthew W. Stirling. *Upper Left* Stone head, 8½ feet high, 22 feet in circumference. *Upper Right* A giant stela, 14 feet high, braced upright by mahogany logs. At the lower part of the photograph two carved figures are visible, each about seven feet tall, the face of one destroyed, the other with aquiline nose and flowing beard. *Below* Stone altar. The life-size figure in the arched niche holds a rope that passes around the bottom of the altar.

Puuc district. Here the ruins included types which on the one hand resembled that of the southern Mayan and on the other the typical Puuc. Smith and Shook also worked for several weeks on the mounds at San Agustín Acasaguastlan where two vaulted tombs were opened and found to contain much beautiful pottery. In Guatemala the expedition of the University of Pennsylvania worked for the second season on the continuation of the archaeological survey of the Alta Verapaz which had been initiated in 1939.

Most dramatic of the year however is the work of the joint expedition sent out by the National Geographic Society and the Smithsonian Institute to carry on its second season's campaign at Tres Zapatas in southern Vera Cruz. Since Tres Zapatas is one of the oldest occupied sites in Vera Cruz much was expected from work on the site. As a matter of fact after the close of this second season's campaign enough material has been accumulated to supply a complete record of habitation of the place from a point several centuries before Christ to a time shortly before the arrival of the Spaniards. Not the least interesting is the fact that some of the relics were found below a deposit of sedimentary rock some 20 feet below the surface of the ground. This rock was sandstone and about 2 feet thick. Under it was a deposit of earth 4 feet thick filled with fragments of pottery and figurines. At other places on the site and at different levels appeared artifacts entirely different in character, which made it possible to distinguish the cultural material of these periods. In one of the smaller mounds was made one of the most exciting finds of the season. Here at a depth of 6 feet was found a group of clay vessels together with a human skull, complete except for the lower jaw. In all there were 35 elaborate figurines and 12 painted clay disks over which were inverted 15 finely made clay vessels. This pottery proved to be valuable for tying in similar ware elsewhere.

Besides the work at Tres Zapatas two days were spent at Cerro de Mesa, near Vera Cruz, where the mounds are very large, and in the chief group with the high ones near together. Most of them were conical or pyramidal and built on great platforms rectangular in plan. On this site 12 stelae and eight other sculptured stones were brought to light. The most interesting of these stelae is one (no. 6) which shows an early Initial Series date in the Mayan calendar that can be read as 206 or 466 A.D. according to the authority followed. This is the farthest north an Initial Series has been discovered.

The next work was carried on at La Venta in northern Tabasco. Here on a sand island set in the midst of a swamp were made some of the most interesting finds of the season. The central feature of the place is a huge earth pyramid measuring about 100 yards along the base and about 100 feet in height. Just to the north of this was a rectangular enclosure 75 yards long and 50 in width, with an additional extension 10 yards wide in the direction of the pyramid. This rectangle was enclosed by a row of columns a foot thick and 10 in height set close together. Two altars were excavated. One proved to be a huge monolith rectangular in section with a thick table top projecting on the four sides. On the front is carved an arched niche in which is a seated figure, cross-legged and wearing a headdress in the form of a jaguar's head. Each hand of the figure holds the

end of a large rope that passes around the bottom of the monument. The second altar, which proved to be artistically the most important object discovered, showed on the four faces a figure holding an infant in its arms, suggesting the rite of infant sacrifice. Within the enclosure already referred to a great stele was uncovered, 14 feet tall, 7 in width, and 34 inches thick. On it in low relief were two standing figures face to face and wearing tall headdresses. Unlike those at Tres Zapatas these do not use feathers. Nearby, in the jungle, the explorers found a huge altar in the form of a human head. Particularly noteworthy was the hole which passed from the left ear to the mouth suggesting that perhaps this was used by the priests to issue fake oracles. In a neighboring thicket was also uncovered the colossal head referred to some years ago by the explorer Blom. It proved to be 2 feet higher than the colossal head found at Tres Zapatas. Besides this colossal head three other heads were found bringing the total of sculptured monuments up to 20. Several proved to be the finest yet found in America. They were cut from an igneous rock which is not found within 50 miles of this site. The moving of these huge masses of stone tells of considerable engineering skill on the part of these people. See CHEMISTRY. OLIVER S. TONKS.

**ARCHERY.** In a year when mechanized warfare screamed its story everywhere, the medieval bow and arrow continued to hold people breathless as old and modern records were shattered at random throughout 1940. Russ Hoogerhyde of Northbrook, Ill., in a remarkable display of muscular and visual co-ordination, outclassed Marvin T. Schmidt of Chicago to carry off the men's national championship at Amherst, Mass. He thereupon became the United States male champion for the sixth time, though not consecutively. The defending title-holder, Pat Chambers of Portland, Ore., invincible at other times, fought valiantly to no avail.

Miss Anne Weber, 18-year-old student at Montclair, N.J., State Teachers College, annihilated all the major records in the women's national tournament. In dethroning Miss Jean Tenney of Clear Spring, Md., she set a high mark for herself of 1180 points to Miss Tenney's record of 1088 in a similar double round in 1938. In retaining her Eastern Archery Championship at Storrs, Conn., Miss Weber scored 143 hits out of a miraculously possible 144 and missed only once in 468 shots over a period of three days.

Fred Folbert of Cleveland, whose stance was not unlike that of the late William Tell, was the undisputed national boy's champion; and Miss Mary C. Thompson of Phoenix, Ariz., succeeded to the corresponding title among the girls of America.

**ARCHITECTURE.** The year 1940 was a turbulent one for architecture, with threats of worse to come. The virtual levelling of downtown Rotterdam, defenseless and undefended, in a few minutes' work, set a new record in the destruction of peaceful building by war. Despite regular bombing, London's building losses were put as low as 2 per cent of the total by some estimators at the end of the year; yet the historic Guildhall, parts of Temple Court, and a score of churches by Wren were destroyed along with less famous buildings. Coventry's 14th-century cathedral was a loss less frightful than the razing of the town.

In the United States, the defense program com-

ing on top of rising activity stirred up a construction fever; awards of \$238,793,000 in one week set a new record. Independent architects, however, received a disappointingly small share of the work, as they also had in England; it was largely assigned to Government bureaus. Remarkable developments might be expected in the building arts if peace could somehow be maintained. See also BUILDING.

**Residential.** A high total of 525,000 dwelling units produced throughout the year exceeded the previous year's output by some 40,000 units, but still resulted in an increasing rather than decreasing residential deficit, for Defense Housing Co-ordinator C. F. Palmer estimated the annual need at 800,000 new units and the total deficit at 4,000,000. (See NATIONAL DEFENSE ADVISORY COMMISSION.) The year's work attested the rapidly widening spread, not only in standards of quality, but in kinds of houses built and in architectural approach.

Through natural lag there was a growing disparity between houses and other buildings in terms of technical progress and style. The favorite stylism in the great bulk of residential building was a very modified "Colonial," especially predominant in work insured by the Federal Housing Administration (q.v.). The FHA role was in fact ambiguous. The Rental Housing Division was without doubt enormously improving the standards of amenity, especially in site planning, in large-scale work. In small homes, on the contrary, FHA tended to play Jekyll and Hyde, raising standards at the bottom but freezing them at the top. Complaints arose of an increasing tendency among local appraisers to veto the plans of precisely those architects whose study was most thorough and results consequently out of the average. An extreme case was the derisive valuation of \$500 set by a local FHA appraiser on a house plan which, later on, built by the architect under private financing for \$6000 and submitted to a well regarded annual magazine competition, received the nation-wide first prize against a strong field. In any one case, however, bureaucratic prejudice was extremely difficult to prove because the architectural decision was wrapped up with so many others by nature confidential.

In the most progressive design trends, differentiation seemed to be setting in among regions. In the Pacific northwest, such houses as the Watsek house (by A. E. Doyle and associate; John Yeom, collaborator) had a special flavor of the surrounding forest, not only in materials but in the elevated character of the high open gable supported on simple posts to form the porch. New San Francisco work was characteristically quiet with a simple reticent breadth. The city was unique in the fact that large town houses were being erected on its central streets. One side street on Telegraph Hill, all taken by a row of Gardner Dailey houses recently built or building, formed a remarkably collected and suave urban view. Among notable examples outside the town were the small Taylor house by Dinwiddie (A. H. Hill, assoc.) and a harmonious group by Frederick L. Confer, for officers at Hamilton Field. The brilliant new designs in Texas bore a family resemblance to those of the San Francisco region, but with wholly different planning for a hot climate. (San Jose ranch, Hersch house, Boaland house, by O'Neil Ford and A. B. Swank.) Southern California continued its more dramatic, personal, and sometimes exaggerated forms. Numbers of houses by Neutra displayed the strong polished cubism expected of this

designer. Harwell Harris produced a number of houses, especially the Blair house outside Los Angeles, of a personal, charming, and cleverly planned variety, besides the spectacular Havens house, widely cantilevered, at Berkeley. A beautifully detailed remodelling job was the Dr. Maitland house in Bel Air, re-done by J. R. Davidson; as the work of a practitioner trained abroad it found an echo in such houses as the one at Lincoln, Mass., by Walter F. Bogner, very similar in spirit to work by Gropius and Breuer. More cross-play with single slabs or planes was found in the advanced work of the East than that of the West, also more contrasts in textures. The East also clung more to "traditional" or eclectic types, such as a house in Puntney, Vt., by Van der Gracht & Kilham, or a new house in Norwood, Mass., of "early American derivation," by David J. Abrahams. Midwestern designers, such as Alden Dow (George Green residence, Midland, Mich.), looked to the Wright tradition for dramatic contrasts. In Chicago a boldly experimental house, the "Solar House," was designed by George Fred Keck to test the value of sunlight, properly controlled, as an auxiliary furnace. Panel heating as a new development was extensively developed near Chicago, e.g. in houses by Schweikher, Lamb & Elting. A parallel expedient was the house at Redding, Conn., by Henry N. Wright, with Hornbostle & Bennett as associates. The Thorp house at Sudbury, Mass., by Derby, Barnes & Champney, was "early American" in expression with an efficient modern plan. A large, formal house, eclectic in its elements and studied in its modified forms, was the large Rosenwald house-museum near Jenkintown, Penna., by Ernest A. Grunsfeld, Jr., Wallace F. Yerkes, assoc.

**Housing and Large-Scale Developments.** One of the most distinguished among all projects of the U.S. Housing Authority (q.v.) was Valleyview homes at Cleveland, by Hayes, Huntziger & Simpson, with its fine domestic scale, studied proportions, careful balancing of factors, and especially the care taken with cheap brick to achieve interesting texture and color. Other USHA projects: the carefully studied high-density project, "East River Houses," in New York (Voorhees, Walker, Foley & Smith; Alfred Easton Poore, C. W. Schlusing; Perry Coke Smith, ch. arch.); Holly Courts project in San Francisco, by Arthur Brown—architecturally uninteresting; Cuney Homes, Houston, Texas, (Nunn & McGinty). FHA projects included Parklane Apartments, Houston (Talbot Wilson and Irwin Morris); Front Royal Gardens, Va., by A. R. Clas. A good privately financed development was Dundalk, Maryland, by Gustave W. Iser.

So far as "defense housing" is concerned, little of architectural interest had yet developed. A great spur was being given to prefabrication. The Navy Department of Docks and Yards, under Rear Admiral Ben Morrell, started 100 twelve-family two-story apartments at Newport News through Tennessee Coal, Iron, and R.R. Co., and a 1042-unit apartment project in Norfolk, Va. through "Stran-Steel." The clearing of 69 defense projects through Public Buildings Administration (q.v.), a bureau experienced only in monumental work and post offices, rather than through USHA with its developed housing technique and contact with outside architects in the field, was criticised in the profession. Meanwhile The Farm Security Administration (q.v.) won the applause of an influential part of the architectural press. Under the brilliant

leadership of Vernon De Mar, architect, FSA had worked out novel, effective, and useful migrant labor camps and farm settlements.

**Industrial Buildings.** An enormous amount of new industrial construction was contracted for. Planning advances in the interest of dispersion were however not made. Experimentation was going on with screening as well as complete enclosure in the interest of blackouts. Defense factories may not be identified for description. A factory such as the Church & Dwight plant, by Austin C., at Syracuse, N.Y., shows the somewhat heavy pseudo-streamlined monumentalism in which many factories are now bedecked.

**Commercial Buildings.** Office buildings were erected less frequently in the interest of generalized speculation, more often for specific occupancy. The Banker's Life Co. building at Minneapolis was a most thoroughly studied example (Tinsley, McBroom & Higgins). The CBS broadcasting studios in New York, by Fellheimer & Wagner, were another such specialized assignment.

Transportation was yielding not only the strings of brightly colored streamlined trains but new terminals and hotels. One of the phenomena of the year was the great boom at Miami Beach which resulted in the erection at almost regular intervals of some 41 new hotels, all in strikingly "modern" manners, reputedly financed with capital that had "fled" Europe. A less conspicuous but neatly designed middle-sized hotel in Columbia, S.C., was the Wade Hampton by Holabird & Root. Tourist courts were rapidly coming up and employing architects. Jack Tar Court at Galveston, and the Rancheria "Motel" near Santa Barbara, showed better than average planning and amenities.

The Washington, D.C., national airport, designed by Howard L. Cheney as consulting architect, was on clean lines not unlike those used in France. The Coast Guard Station at Cleveland, by J. Milton Dyer, was an unusually clean-cut solution.

Stores and commercial establishments continued to burgeon. The May Co. department store on Wilshire Blvd. at Los Angeles (Albert C. Martin, Samuel A. Marx) and the Saks Wilshire by Myron T. Hunt were two very diverse expressions, the first one dashing and the second dignified. Small specialty stores continued to be remodelled so as to throw their front arcades into a deep scheme permitting easy visual penetration of the interior, as an invitation to enter. The front partition was often wholly of glass. (Candy shop for Altman & Kuhne, New York, by Gruenbaum and Krummeck; dress shop in Berkeley by Dinwiddie; Tourneur make-up salon, New York, by Morris Sanders.) See CO-OPERATIVE MOVEMENT.

**Institutional. Churches.** Mostly conventional, churches departed occasionally from their Romanesque and Gothic garb. Of this eclectic garb itself, Henry D. Dagit & Sons gave samples in the Slovak Girls Academy, Danville, Pa., and the Gothic Co-Cathedral in Atlanta. So, too, did Cram & Fergusson in the Conventional Church of St. Mary and St. John at Cambridge, Mass. A vivacious though reverent departure was the very small chapel of the St. Peter Claver Mission, Montclair, N.J. (Albert Hoffmann, des.; George Kratina, sculp., Vincent Pacelli, painter; Paul C. Reilly, architect.) Others: the "Little Chapel in the Woods" for Texas State College for Women—designed under the National Youth Administration auspices by O'Neil Ford & A. B. Swank; Church of the

Epiphany in New York by Wyeth & King, and Eugene W. Mason—a handsomely massive 'Norman Gothic' tower to York Avenue.

**Schools.** College buildings broke with eclecticism more often and more decisively than heretofore. Harvard and Yale still stood by. Coolidge, Shepley, Bulfinch & Abbott supplied Harvard with two of their refined buildings of generally Grecian character, and Eggers & Higgins did the Silliman College building at Yale in fairly vigorous Colonial. On the other hand, Hornbostel and Bennett did a studied contemporary alumnae building for Wheaton College at Norton, Mass.; the University of Wisconsin received a highly functional theater and art center from Michael Hare and Corbett & MacMurray (Lee Simonson, theater consultant). Shreve, Lamb & Harmon did a strictly contemporaneous design for Hunter College, New York; their auditorium for Connecticut College at New London was more decoratively "modernistic."

Public school buildings continued to move forward rapidly, with large and highly articulated plants the prevailing mode. Marsh, Smith & Powell's El Monte (Cal.) high school was one such elaborate campus grouping. Burnham Hoyt and Edward L. Bunts did a well composed school at Colorado Springs. The Bossier High School, Bossier, La., was a single building likewise made up of five linked elements. Lyndon, Smith & Winn added a fine auditorium to their excellent Farmington, Mich., high school. A school for crippled children at Denver, also by Hoyt, was one of the recent school masterpieces, with its vigorous and reassuring front, its convenient ramps, and its plan with classrooms in pairs alternating with courts. A happy modern nursery school design was achieved by Oscar Stonotov within the walls of an old church at Charlestown twp., Pennsylvania. Private schools played into the same wide range. A rather exceptionally attractive group, despite utter simplicity, was Lincoln Hall at Lincolnale, N.Y., for the "Christian Brothers," by Van der Gracht & Kilham.

Among auditoriums, the Berkshire Music Shed by Joseph Franz, engineer, was remarkable in the combined sense it gave of protection and openness. A. E. Doyle and Associate did a more than competent addition to the Portland Museum of Art.

**Hospitals and Health Centers.** These continued one of the most vigorous groups of buildings. Almost unquestionably the most interesting among them was the Lake County Tuberculosis Sanatorium at Waukegan, Ill., by Wm. A. Ganster and the offices of W. L. Pereira, associated architects. The continuous balconies for patients were made the main feature of the design with all its agreeableness. The larger Triboro Hospital for Tuberculosis at Jamaica, New York, by Eggers & Higgins, was necessarily more institutional in effect because larger in size. A third notable large hospital was the additional wing at the Massachusetts General Hospital at Boston (Coolidge, Shepley, Bulfinch, and Abbott), representing a cleanup and further development in the Cornell Medical Center scheme by the same firm.

DOUGLAS HASKELL.

**ARCTIC EXPLORATION.** See POLAR RESEARCH.

**ARGENTINA.** A federal republic of South America, consisting of 14 provinces, 10 territories, and the federal district, which includes the capital, Buenos Aires.

**Area and Population.** Land area, 1,079,965 square miles. Estimated population on Dec. 31, 1939, 13,129,723 (7,885,237 at 1914 census). Estimated population of Buenos Aires, 2,364,263 on Dec. 31, 1939; of the other chief cities on Jan. 1, 1938: Rosario, 511,007; Córdoba, 288,916; Avelaneda, 230,775; La Plata, 190,577; Santa Fé, 143,327; Tucumán, 140,000; Bahía Blanca, 108,310.

**Education and Religion.** About 16 per cent of the adult population was estimated to be illiterate in 1939 (less than 2 per cent in the federal district). School statistics for 1937 were: Primary, 13,036 schools, 1,543,317 pupils; secondary, normal and special, 605 schools, 98,302 pupils; universities, 6 institutions, 27,885 students, exclusive of the University of Cuyo founded at Mendoza in 1939. The Roman Catholic Church is supported by the state; all other faiths enjoy freedom of conscience.

**Defense.** As of Nov. 1, 1939, Argentina had 49,705 men in active military service, including conscripts; an additional 2023 in the military and naval air forces, with about 200 planes; a trained army reserve of 282,503 men; and a naval force of 2 old battle ships (recently modernized), 3 cruisers, 4 old coast defense vessels, 16 destroyers, 3 submarines, 15 patrol vessels, and various auxiliary craft.

**Production.** Agriculture, stock raising and manufacturing are the main occupations. Agricultural products accounted for 48.8 per cent of the value of all 1939 exports; livestock products, 43.7 per cent. Yields of the chief crops in 1939-40 were (provisional, in metric tons): Wheat, 3,212,000; corn, 11,028,000; linseed, 1,127,000; cotton, 70,891 in 1938-39; oats, 750,000 in 1938-39; cane sugar, 521,594 in 1938-39; tobacco, 7812 in 1938-39. Rice, fruit, wine grapes, potatoes, etc., are other crops. Livestock slaughtered at "frigoríficos" in 1939 included 4,424,172 cattle, 5,563,275 sheep, and 869,435 swine. The chief mineral product is petroleum (about 2,628,000 metric tons in 1939). Important new wells were brought in near Mendoza late in 1939. Tungsten, lead, zinc, copper, gold, silver, and coal are mined in relatively small quantities. The industrial census of Dec. 31, 1937, showed 49,333 establishments with 62,634 employees and 579,752 workmen who received wages and salaries aggregating 947,870,000 pesos during 1937. The value of finished goods produced was 4,708,379,000 pesos.

**Foreign Trade.** Exclusive of specie, imports in 1939 totaled 1,338,332,000 pesos (1,460,888,000 in 1938) and exports 1,570,226,000 pesos (1,400,453,000 in 1938), on the basis of real values. Leading 1939 imports were (in millions of pesos): Fuels and lubricants, 231.3; textiles and manufactures, 219.9; machinery and vehicles, 131.7; iron and manufactures, 121.8. Leading exports were (in millions of pesos): Cattle and products, 686.0; agricultural, 766.7; forest, 48.0; mining, 18.8. The United Kingdom supplied 19.9 per cent of the 1939 imports by value (18.3 in 1938); United States, 17.2 (17.7); Germany, 9.2 (10.1). Of the 1939 exports, the United Kingdom took 32.9 per cent (32.8 in 1938); United States, 11.9 (8.5); Germany, 5.7 (11.7). See TRADE, FOREIGN.

**Finance.** The 1940 budget estimates of the Central Government, as readjusted on June 20, placed receipts for the calendar year at 915,000,000 pesos and expenditures at 1,077,700,000. Actual budgetary revenues amounted to 907,410,000 pesos for 1939 and the deficit for the year was

60,500,000 pesos. The national public debt (3,896,600,000 pesos on Dec. 31, 1938) increased by 461,300,000 pesos during 1939.

The official exchange rate of the paper peso averaged \$0.2703 from Jan. 1 to Aug. 21, 1939, and \$0.2315 from Aug. 22 to Dec. 31, 1939 (\$0.3021 in 1938); free market rate, \$0.2309 in 1939 (\$0.2551 in 1938).

**Transportation, etc.** In June, 1939, Argentine railways had 26,564 miles of line, of which 7826 miles were state-owned. Highways in 1939 extended 253,115 miles. To speed road construction new taxes on gasoline, lubricating oils and other motor combustibles were imposed Apr. 15, 1940. Reconstruction of the Transandine railway tunnel to permit the passage of automobiles was completed in February, 1940. Automobiles in operation in Argentina declined from 435,822 in 1930 to 405,743 in 1939. European air services to Argentina were interrupted by the spread of the war during 1940. Pan American Airways inaugurated a tri-weekly three and one-half-day schedule on its Miami-Buenos Aires east-coast route in September. New air services linking Buenos Aires with Colonia, Uruguay, and with Esquel (Chubut Territory) were opened. During 1939 a total of 2619 sea-going ships of 9,452,316 net registered tons entered Argentine ports.

**Government.** The Constitution of 1853 vests executive power in a president chosen for a six-year term by 376 electors representing the provinces and the federal district. The National Congress consists of a Senate of 30 members elected for nine years by the provincial legislatures and a Chamber of Deputies of 158 members elected for four years by universal male suffrage. One-third of the Senate retires every three years and one-half of the Chamber every two years. The governors of the provinces, elected by local suffrage, exercise extensive powers independently of the federal government. President in 1940, Dr. Roberto M. Ortiz, who assumed office Feb. 20, 1938.

## HISTORY

**Internal Politics.** A series of elections during 1940 gave the pro-democratic Radical party control of the Chamber of Deputies and of the important province of Buenos Aires, thus restoring the forces of liberalism to the dominant position lost through the conservative revolt of 1930. The Radicals, who favored co-operation with the United States and were sympathetic to the Allied cause in Europe, won a favorable strategic position for the 1943 presidential election. The Radical party's comeback was greatly facilitated by President Ortiz's courageous efforts to restore representative government in Argentina by curbing fraudulent electoral practices adopted by the conservative National Democratic party in its struggle to retain power.

President Ortiz had been elected by the *Concordancia*, a coalition of the National Democrats with his own dissident *Antipersonalista* wing of the Radical party. Nevertheless on Feb. 19, 1940, he supplanted the National Democratic governor of the province of Catamarca, whose election was attributed to wholesale frauds. A federal "interventor" was installed with instructions to hold new elections. Two National Democratic members of the Ortiz Cabinet (José Padilla, Agriculture, and Manuel Alvarado, Public Works) resigned in protest against the President's intervention. Dr. Ortiz took similar action following innumerable charges

of fraud in the gubernatorial election in the province of Buenos Aires on February 25. On March 7 he supplanted Gov. Manuel Fresco, a National Democrat, and voided the election. Octavio R. Amadeo, Ambassador to Brazil and a confirmed democrat, was named "interventor."

Meanwhile elections to the Chamber of Deputies were held March 3 in 9 of the 14 provinces, including the province of Buenos Aires, and on March 31 in the federal district (city of Buenos Aires). Due to the President's attitude there were fewer electoral irregularities and the Radicals were able to register their full voting strength. The standing of the parties in the Chamber of Deputies as a result of these elections follows (former standing in parentheses): Radicals, 79 (62); National Democrats, 49 (57); *Antipersonalistas*, 24 (23); independent Radicals, 5 (5); Socialists, 5 (5). The Radicals thus outnumbered the combined National Democratic and *Antipersonalista* delegations, forming the government bloc in the Chamber.

President Ortiz's policies appeared to be leading him into an alliance with the opposition Radical party, to which he formerly belonged. His intervention in Buenos Aires Province had brought his relations with the National Democrats near the breaking point. This situation was modified by the announcement on July 3 that the President's ill health had forced him to turn over his office temporarily to Vice-President Ramón S. Castillo, a National Democrat who had publicly opposed President Ortiz's intervention in the Catamarca electoral squabble.

In August anti-democratic elements within and without the government seized upon a land-purchase scandal in an effort to discredit the Ortiz regime and the democratic system. A Senate investigating committee on August 8 reported that land purchased for a new army air base at El Palomar near Buenos Aires had been sold to the government at a 1,000,000-peso profit by two speculators, who distributed half the profits as bribes to Deputies, former Deputies, and members of the War, Finance, and Justice Ministries. The Senate approved the report August 21, voting to submit the case to the Chamber of Deputies and the law courts. The revelations produced recriminations and threats of force within the government and the army high command. On August 20 the former chief of the army's engineering section was arrested and military and police precautions were taken to avert a threatened Rightist coup.

In the midst of an acute crisis, President Ortiz forced a showdown by submitting his resignation, charging that "there is a greedy but hidden political purpose in the investigation of this affair." Public opinion rallied strongly to the President's support and on August 24 Congress voted 170 to 1 to reject his resignation. The Argentine press and numerous speakers during the Congressional debate declared the basic issue to be between the pro-democratic Ortiz and his pro-Fascist enemies. The vote in a joint session of the Senate and Chamber was declared a historic victory for democracy. On August 27 the cabinet resigned to give President Ortiz a free hand in terminating the political crisis. Apparently at the insistence of Acting President Castillo, he turned over to the latter responsibility for selecting the new ministry.

The officials sworn in September 3 were mostly conservatives of moderate views, acceptable to both Ortiz and Castillo. The Acting President and cab-

inet were pledged to maintain Argentina's democratic institutions and to carry forward the policies of the Ortiz Government. The new cabinet line-up was: Foreign Affairs, Julio Roca; Interior, Miguel Culaciatti; Finance, Federico Pinedo; Agriculture, Daniel Amadeo Videla; War, Gen. Juan M. Tonassi; Marine, Rear Admiral Mario Fincatti; Public Works, Salvador Oria; Justice and Public Instruction, Guillermo Rothe. On September 6 the Chamber of Deputies, 79 to 27, absolved the former War Minister, Gen. Carlos D. Marquez, of blame for the land-purchase scandal.

Another controversy between the Radicals and the National Democrats broke out in connection with the provincial election of December 15 in Santa Fé Province. The Radicals, who formed the Opposition party in the province, charged that National Democratic officials fraudulently manipulated the electoral returns to perpetuate their control. President Ortiz was again requested to intervene to insure an honest election.

**War Repercussions.** The European War continued to exercise an unfavorable political and economic effect upon the republic. There was a marked reduction of trade with Europe, which was offset only in part by increased trade with the United States and other American republics. Divisions between Argentine political and racial groups were widened by their divergent sympathies for the European belligerents. In January ex-President Marcelo T. de Alvear, leader of the Radical party, and a number of other public figures formed a pro-Ally committee to combat totalitarian and anti-Ally propaganda. Later he alienated some members of his party by reiterating publicly his support of Britain. The Socialist national congress on August 5 formally endorsed Great Britain as the defender of democracy. An anti-totalitarian organization, *Acción Argentina*, recruited 300,000 members from many different political parties within six months of its inauguration. The pro-Ally groups were vigorously opposed by pro-German, pro-Italian and pro-Soviet elements.

Meanwhile German military successes and the subjugation of European neutrals led to the strengthening of Argentine defenses. The compulsory military service law was amended to permit the training of technicians and other specialists for new mechanized branches of the army. In June and July the government submitted to Congress a series of bills providing for a greatly enlarged army, navy, and air force, the expansion of defense industries, and the establishment of new air bases. The cost was estimated at about \$330,000,000. To complete action on these measures, and on an expanded program of public works, the construction of national tourist hotels, and the 1941 budget, Acting President Castillo on October 1 issued a call for a special session of Congress.

The war's restriction of European export markets caused a sharp decline in Argentina's customary excess of exports over imports. To deal with the growing surpluses of grain and wool, Congress on August 14 authorized the Executive to purchase the 1940 corn crop at 475 pesos per 100 kilograms and the Bank of the Nation granted wool growers low-interest loans up to 75 per cent of the value of their clips.

On November 11 the government submitted to Congress a plan drawn up by Finance Minister Pinedo, designed to carry Argentina through the economic crisis resulting from the war. As approved by the Senate on December 18, the plan

called for the establishment of an agency within the Central Bank, having an initial capital of 25,000,000 pesos, to stimulate manufacturing industries, inaugurate a nation-wide low-cost housing program, and finance government purchases of unmarketable agricultural surpluses. Purchases of surplus wheat and linseed in accordance with this plan were begun December 2. Financial backing for the program was obtained in the United States through a Treasury loan of \$50,000,000 for currency stabilization, approved December 5, and a \$60,000,000 loan from the Export-Import Bank, authorized December 11.

**Nazi Activities.** Argentine alarm at European developments was enhanced by further revelations of Nazi activities within the republic (see preceding YEAR BOOKS) and in neighboring countries (see BOLIVIA, CHILE, and URUGUAY under *History*). In April interned officers and seamen from the German warship *Graf Spee* were imprisoned when a number of them took advantage of the freedom permitted them to attempt to escape. On May 22 the Buenos Aires press indignantly charged that the German Embassy had notified Danes and Norwegians in that city to contribute 20 per cent of their salaries to a Nazi war fund. The sinking of the Argentine ship *Uruguay* by a German submarine off the Spanish coast late in May provoked anti-German demonstrations in the capital. The Ortiz Government sent a formal protest to Berlin.

Revelation of the Nazi revolt plot in Uruguay (q.v.) was followed by the passage by the Chamber on June 8 of a Public Order Bill to curb "fifth column" activities and propaganda on behalf of foreign governments. The wrecking of a British freighter at a Buenos Aires dock on June 12 by time bombs was attributed to Nazi sympathizers. Arrests were made among Nationalist, Nazi, and Fascist adherents. A press law signed by President Ortiz June 11 restricted publication of "opinionated articles" and banned foreign subsidization of newspapers or magazines without government permission. The Buenos Aires police department was reorganized after the Ministers of War and Marine charged the police with failure to co-operate in efforts to investigate Nazi activities.

The investigation, pursued throughout the remainder of the year, turned up extensive evidence of Nazi plotting and preparations for political and military action to bring Argentina into line with Hitler's National Socialist policies and principles. Nazi cells and hidden stores of arms and propaganda materials were discovered in the capital and in widely scattered points in the provinces, particularly in the territory of Misiones, adjoining the southern Brazilian states with their large German populations. In August the government deported an agent of the German secret police and arrested 25 other Nazi leaders as well as several pro-Nazi Argentine citizens accused of "fifth column" activities.

The German military mission attached to the Army Technical College was discharged on July 3. To the annoyance of the Argentine Government, Berlin named two of these officers as military attachés in the Chilean and Brazilian capitals. When Minister of Interior Culaciatti assumed office, he eliminated all government advertising from anti-democratic publications and forced the retirement or dismissal of police and defense officials who had failed to suppress Nazi and Fascist activities. A number of German-language schools in the Province of Misiones were closed.

**Foreign Relations.** Argentine foreign relations in 1940 were marked by a trend toward closer relations with the United States in inter-American political and military affairs. At the Havana Conference in July (see PAN AMERICANISM), the Argentine delegation after some hesitation approved Washington's program for strengthening inter-American security through joint political, military, and economic measures. In mid-October Gen. Guillermo José Mohr, Inspector General and highest ranking officer of the Argentine army, joined other Latin American military officials in a tour of United States defense centers and in staff talks covering military co-operation in the event of an attack upon the Western Hemisphere from overseas.

An agreement on closer Argentine-United States economic collaboration proved more difficult to reach. Negotiations for a reciprocal trade treaty, begun in 1939, collapsed on Jan. 5, 1940, when the two governments failed to reach a compromise on their divergent commercial policies. Soon afterward Argentina concluded a trade pact and a complementary exchange arrangement with Japan that gave the Japanese a preferred position over the United States in many items of trade. At Havana the Argentine delegation successfully opposed President Roosevelt's proposal for an inter-American cartel to control the sale of New World raw materials.

On June 26 the Export-Import Bank of Washington extended the Central Bank of Argentina a three-year \$20,000,000 credit. However differences arose over the use of this credit that were not adjusted until October. Meanwhile Argentina's unfavorable balance of trade with the United States became steadily greater as a result of the shift in Argentine imports from Europe to North America. At the same time the decline in the Argentine export trade made the country's economic future look increasingly dark.

In an effort to conserve dollar exchange, and possibly to obtain a better bargaining position, the Argentine Foreign Exchange Control Board on September 19 suspended issuance of all import licenses for United States goods. This caused the closing of automobile assembly and other plants in Argentina dependent upon imports from the United States, and aroused criticism of the government's trade policies in the Argentine press. In a new effort to find a solution for its mounting trade, foreign exchange, and financial difficulties, the government sent an economic and financial mission led by Dr. Paul Prebisch, head of the Central Bank, to Washington in November. After the mission obtained U.S. government loans totaling \$110,000,000 (see above), Argentine curbs on imports from the United States were relaxed.

The Argentine Government also sought to find markets in other American countries to replace those lost in Europe. A conference held in Valparaíso, Chile, in February launched a movement for closer economic relations between the provinces of Western Argentina and Chile. In October a large Argentine financial-economic mission visited Chile to arrange for an expansion of mutual trade. On April 2 a provisional Argentine-Bolivian accord was signed in Buenos Aires whereby the Argentine Government agreed to finance construction of the projected Yacuiba-Santa Cruz de la Sierra railway, tapping the Eastern Bolivian oil zone (see BOLIVIA under *History*).

An Argentine-Brazilian trade accord was signed January 23. On October 6 the Argentine and Bra-

zilian Finance Ministers, meeting in Rio de Janeiro, recommended that their governments expand trade on a balanced basis, especially in new and non-competitive products. On October 11 the Argentine Government announced the conclusion of an important deal with Great Britain under which the British agreed to increase their purchases of meat and other foodstuffs in Argentina beyond any previous figure for the ensuing year. Argentina undertook to advance Britain a credit of £40,000,000 to finance these purchases, the credit to be repaid partly in cash and partly in Argentine bonds held in Great Britain. Late in November Spain was allowed to purchase 150,000 tons of Argentine corn on credit.

The Foreign Ministers of Argentina and Uruguay, at the end of a conference at Colonia, Uruguay, on December 13-14, signed an accord for mutual co-operation in defending the River Plate region against non-American aggression. They invited neighboring republics to join Argentina and Uruguay in strengthening defense facilities in that part of South America. The conference took place at Argentina's request following conclusion of an agreement for United States financial and technical aid in establishing Uruguayan defense bases. The question of an Argentine-Uruguayan trade treaty was referred to a mixed commission.

A National Antarctic Commission was established in the Ministry of Foreign Affairs to press Argentina's claims to part of the Antarctic continent (see YEAR BOOK, 1939).

See BOLIVIA, BRAZIL, CHILE, and URUGUAY under *History*; FASCISM; LEATHER; NAVAL PROGRESS; PAN AMERICANISM; PAN AMERICAN UNION

**ARIZONA.** Area, 113,956 square miles, including (1930) water, 146 square miles. Population, Apr. 1, 1940 (census), 499,261; 1930, 435,573. Phoenix, the capital, had (1940) 65,414 inhabitants.

**Agriculture.** Arizona harvested about 665,000 acres, in 1940, of principal crops. This total, while small in relation to the number of the inhabitants, surpassed by about one-eighth the corresponding average for the previous decade. Cotton, covering 221,000 acres, or one-third of the harvested total, gave 195,000 bales, of which the estimated value to the growers approximated \$11,310,000; tame hay, on 218,000 acres, 445,000 tons (\$4,005,000 by estimate); wheat, 39,000 acres, 819,000 bu. (\$663,000) was the foremost of the remaining field crops. Grapefruit, an orchard crop of rising importance, yielded about 2,570,000 boxes (\$797,000). Part of the new "winter flaxseed belt," Arizona produced, on 13,000 acres, 240,000 bu. of flaxseed (\$408,000), a remarkable yield of 18½ bu. (\$31) to the acre, as against 9.6 bu. (\$13.40) an acre for the Union's whole crop.

**Mineral Production.** The 1940 (definite 1939 figures in parentheses) approximate value of Nevada's five principal minerals—copper, gold, silver, zinc, and lead—was \$81,509,300 (\$72,616,408) of which copper, 558,000,000 lb. (524,224,000 lb.), represented \$63,054,000 (\$54,519,296); gold, 292,500 oz. (316,453 oz.), \$10,237,500 (\$11,075,855); silver, 6,948,000 oz. (7,824,004 oz.), \$4,940,800 (\$5,310,839); zinc, 30,800,000 lb. (13,422,000 lb.), \$2,002,000 (\$697,944); lead, 25,500,000 lb. (21,542,000 lb.), \$1,275,000 (\$1,012,474). Native minerals produced in Arizona during 1938 amounted in value to \$60,756,253 (according to the *Minerals Yearbook* of 1940) of which copper, gold, silver, zinc, and lead accounted for 95 per cent of the total.

**History.** The development of works for irrigation and for generating electrical current from the Salt River made progress; the Salt River District issued for this work its bonds, in June, to the amount of \$1,000,000. As part of the year's plans for military armament the U.S. War Department chose Tucson as a new air-corps station. See RECLAMATION, BUREAU OF.

The Arizona Secretary of State, rejecting the petition of 436 supporters of communism, excluded the Communist ticket from the official ballot for the primary election of September 10. Attorney General Conway gave warrant for this action in an opinion holding that no Communist could qualify for office in the State, since the party's principles sought "to overthrow the Constitution of the United States by force." Governor Jones expressed his support of the exclusion.

The strong pro-Roosevelt majority of the Democratic party voted out of office, in the State primaries, U.S. Senator Henry F. Ashurst, who had sat in the Senate continuously from Arizona's acquisition of Statehood in 1912. Ashurst had opposed the draft (q.v.). Ernest W. McFarland won the Democratic nomination for the next term as Senator. At the general election (November 5) a strong Democratic majority carried the State for Roosevelt as President, while McFarland (Dem.) defeated Irving A. Jennings (Rep.) for U.S. Senator, and Sidney P. Osborn (Dem.) prevailed over Jerrie W. Lee (Rep.) for Governor. The vote for Roosevelt (Dem.) was 95,267; for Willkie (Rep.), 54,030.

**Officers.** Arizona's chief officers, serving in 1940, were: Governor, Robert T. Jones (Dem.); Secretary of State, Harry M. Moore; Treasurer, William Petersen; Auditor, Ana Frohmiller; Attorney General, Joe Conway; Superintendent of Public Instruction, H. E. Hendrix.

**ARKANSAS.** Area, 53,335 square miles, including (1930) water, 810 square miles. Population, Apr. 1, 1940 (census), 1,949,387; 1930, 1,854,482. Little Rock, the capital, had (1940) 88,039 inhabitants. The percentage of urban dwellers—those in communities of 2500 or more—rose to 22.2 (1940), from 20.6 (1930).

**Agriculture.** Farmers harvested, in 1940, 6,146,000 acres of the principal crops. Cotton took up over one-third, occupying 2,104,000 acres, and made 1,540,000 bales (estimated value to growers, about \$72,380,000). Success in getting more cotton to the acre appeared in the figure for 1940, 350 lb., as against 319 for 1939 and 224, the previous ten years' average. Corn, on 2,043,000 acres, gave 42,903,000 bu. (about \$25,313,000); tame hay, on 1,050,000 acres, 1,193,000 tons (\$9,902,000); rice, 191,000 acres, 9,741,000 bu. (\$6,819,000); potatoes, 41,000 acres, 3,895,000 bu. (\$2,532,000); sweet potatoes, 36,000 acres, 3,240,000 bu. (\$2,430,000); oats, 139,000 acres, 3,058,000 bu. (\$1,101,000).

**Mineral Production.** The total yearly value of native minerals produced in Arkansas, according to the *Minerals Year Book* of 1940, attained \$29,395,086 for 1938. Petroleum supplied more than half of this figure; coal, less than one-seventh; natural gas and bauxite, much of the remainder. The production of petroleum rose to 21,143,000 bbl., approximately, for 1939, from 18,180,000 for 1938 (value, \$16,900,000). Somewhat over 1,100,000 net tons of coal were mined in 1939, as against 1,197,000 (value, \$4,013,000) in 1938. The production of natural gas declined by about 9 per cent, to some 18,770 millions of cu. ft. for 1939. Of the

yield of natural gas in 1938, 11,301 million cu. ft., delivered to consumers, had a value of \$2,168,000, at points of delivery; while gasoline obtained from natural gas in 1938 was valued at \$905,000. Bauxite (a clay, the most suitable source of aluminum) was actively produced; the yearly total shipments rose to 427,000 long tons (value, \$2,494,000) from 361,690 tons (\$2,074,954) for 1939. Saline and Pulaski counties (the Arkansan bauxite field) furnished in 1939 some 96 per cent of the bauxite produced in the Union.

A new regulative body, the Arkansas Oil and Gas Commission, replaced the Arkansas Conservation Board in 1939; it gave much attention to applying proration of the output of petroleum and natural gas in new fields. Nevertheless, most of the increase in production of petroleum for 1939, noted above, came from the Magnolia field, which yielded about 3,600,000 bbl. in 1939, as against its initial production of 68,000 in 1938.

The Arkansas Diamond Corporation optioned in July, 1940, to a party intending to renew operations, the peridotite field near Murfreesboro, the Union's only known diamond-bearing site.

**Education.** Persons of school age in Arkansas were reckoned, for the academic year 1939-40, at 624,811 from 6 years to 21. Enrollments of pupils in public schools numbered 472,914. They included 399,000 in the elementary group (291,356 whites and 107,644 Negroes) and 73,884 in high schools (66,542 whites and 7342 Negroes). The year's expenditure for public-school education totaled \$13,832,729. Teachers numbered 10,574 whites and 2599 Negroes. Teachers', principals', and supervisors' combined salaries averaged \$584; those of whites alone, \$636; of Negroes, \$375.

**History.** Arkansas was one of several States to deny to candidates of the Communist party a place on the ballot of the general election of 1940. Their exclusion was carried before the State Supreme Court; it ruled (October 14) that the Communists of the United States and in particular, of Arkansas, advocated the overthrow of established government and could hence be excluded from candidacy.

In the Democratic primary election (August 13) Homer M. Adkins, former Collector of Internal Revenue in Arkansas, gained the nomination for Governor. He defeated, by about 4 to 3, Gov. Carl E. Bailey, who sought a third term. At the general election the voters gave an overwhelming but usual Democratic majority, for Roosevelt as President; for a delegation of seven Democrats, all incumbents save one, as the State's U.S. Representatives; and for Homer M. Adkins, as Governor. The vote for Roosevelt (Dem.) was 158,622; for Willkie (Rep.), 42,121. For Governor, Adkins (Dem.), 184,578; Harley C. Stump (Rep.), 16,600. Voters ratified (136,858 to 34,092) the Legislature's act of 1939 creating a system of workmen's compensation. They rejected a proposed constitutional amendment to pledge the State to keep up yearly revenue from gasoline taxes and the registration of motor vehicles at fully \$8,500,000, for maintaining highways and meeting principal and interest on the refunding bonds of January, 1939.

**Officers.** The chief officers of Arkansas, serving in 1940, were: Governor, Carl E. Bailey (Dem.); Lieutenant Governor, Bob Bailey; Secretary of State, C. G. Hall; Treasurer, Earl Page; Attorney General, Jack Holt; Land Commissioner, Otis Page; Auditor, J. Oscar Humphrey. Except Governor Bailey, all these were re-elected in November.

**ARMAMENTS.** See the topics listed under DEFENSE.

**ARMENIAN SOVIET SOCIALIST REPUBLIC.** See UNION OF SOVIET SOCIALIST REPUBLICS under *Area and Population*.

**ARMISTICES.** See EUROPEAN WAR; FRANCE under *History*.

**ARMY, U.S.** See MILITARY PROGRESS; also, DRAFT, MILITARY; ENGINEERS, CORPS OF; NATIONAL DEFENSE ADVISORY COMMISSION; NEGROES.

**ART. Art and the War.** No review of art for the year 1940 could leave out of account the havoc that the war in Europe has wrought and the changed conditions that it has brought about. In the conquered nations art has virtually come to a standstill. Word has come from Rome that the Villa Medici, long the French Academy, has been confiscated by the Italian Government. It became necessary practically to close the American Academy at Rome and send those holding fellowships back to this country to continue their studies here or in Central or South America. To students winning Roman scholarships in 1940 this same choice was given. Obviously the American Schools of Art and Music at Fontainebleau had to be closed. Both were temporarily set up in this country under French visiting masters, the former, during the summer, on Cape Cod. The many scholarships commonly awarded for travel in Europe to students in professional schools, colleges, and universities had to be withheld or otherwise applied. The great stream of persons visiting Europe in search of recreation was cut off, and with it contacts of incalculable cultural value. The blackout in this field has been complete almost beyond belief.

Before war was declared, because of the ominous gathering clouds, precautions were taken to safeguard the most precious works of art in museums from injury or loss, but the force and effectiveness of the storm brewing was by no means foreseen. In September, after the German occupation of Paris, a part of the Louvre was reopened to the public, but not all, and report has it that many of the safeguarded works have been removed to German soil. What has become of the van-loads of paintings by Rubens, van Dyck, and other great masters which left Brussels during the great exodus as the invading army moved in, has not been told; nor is the fate of the Dutch galleries and their collections known.

The damage in Great Britain has been more devastating, but with unconquerable spirit art activities have been surprisingly continued. After the National Gallery of Art was cleared of its permanent exhibits, which were taken to a place or places of supposed safety, Sir Kenneth Clark, the director, arranged and carried out a series of temporary exhibitions to assist in keeping up the general morale, chief among which was one of paintings produced "since Whistler" lent by private collectors. This was visited by over 32,000 persons despite the fact that its date coincided with that of the invasion of Holland. Noonday concerts for working people were also held in the National Gallery, and were well patronized. The Royal Academy held its annual exhibition in May as usual; although there were many things therein to remind of war there were, it was said, "no signs of gloom, bitterness, or satire."

British artists were mobilized by their government to record the war. Muirhead Bone was made artist to the Admiralty, others were sent to the front, which—after the retreat from Dunkerque—

THE NATIONAL GALLERY OF ART

proved to be in London. With bombs dropping indiscriminately from the skies, the Royal Society of Arts kept up its regular fortnightly meetings, at each of which a scholarly paper was presented in accordance with custom.

But all was by no means well. The Tate Gallery, the British Museum, the building wherein the Wallace Collection is housed, and Burlington House, the home of the Royal Academy, have all suffered by bombing, and even more serious damage was done to such irreplaceable works of art as Westminster Abbey, St. Margaret's Church, St. Martin's-in-the-fields, Parliament House, St. Paul's Cathedral, and Guildhouse, to say nothing of the glorious cathedral at Coventry, all of which have been sources of delight and inspiration to countless persons. These are losses which cannot be reckoned by commercial valuation.

The direct effect of all this has been to throw us here in the United States on our own resources. Instead of its usual International Exhibition, the Carnegie Institute, Pittsburgh, substituted in 1940 a Survey of American Art for Three Hundred Years and announced for 1941 another All American show. Numerous exhibitions and sales were held for war relief, and certain very valuable works of art by great masters which were on loan in this country when war was declared are remaining indefinitely in the custody of our Museums as war refugees.

The fact is that at the end of 1940 our continent was practically cut off from the sources from which we derived our standards as well as our inspiration in the past, and we found ourselves faced with the necessity of solving our own problems independently and also charged with the responsibility of maintaining inherited ideals. Economically as well as culturally this is significant. The closing of European ports curtailed imports of industrial art products, and an effort was being made to expand the American art market.

These are some of the shadows which war cast across the American field of Art as the year 1940 closed.

**Art Sales.** War in Europe had little effect upon art sales in this country up to midsummer 1940. In fact even when commodity prices fluctuated art prices remained stable and in some instances went above normal. The leading art auction house in New York (The Parke-Bernet Galleries) reported total receipts for the season, October, 1939-July, 1940, to be \$2,329,330.50. At the time of the invasion of Holland, when there was a marked decline on the Stock Exchange, the Untermyer collection, dispersed by these Galleries, realized \$12,000 more than the advance estimate.

High prices were reported at the Clendenin J. Ryan sale, in January, as follows: "Portrait of a Young Lady," by Andred Solario, \$16,000; a small portrait of Michelle, wife of Philip the Good of Burgundy, by a Master of the 15th century school, \$14,000; "The Crucifixion," by Tiepolo, \$10,000; King George IV, by Lawrence, \$9900; Miss Catherine Chichester, by Romney, \$9200; Alexander Lindsay of Pinkieburn, by Raeburn, \$7500; Lady Frances Windham, by Hoppner, \$7200; and "Portrait of an Italian Nobleman," by Pontormo, \$4800. "Holy Family with St. John and St. Elizabeth," by Andrea del Sarto, brought \$12,000, and "Portrait of Boy in Red," by Lawrence, \$10,400, at the sale of the Aldred collection in December. At the Untermyer sale a painting by Rubens, entitled "Feast of the River Gods," brought \$18,000, a

bronze Jupiter by Cellini, \$11,500, and a painting by Whistler, "Nocturne in Black and Gold—Falling Rocket," \$7000. Especially interesting were prices paid for works by French modernists. At the sale of Mrs. Cornelius J. Sullivan's collection, in New York, a portrait by Cezanne of his wife brought \$27,500; a portrait by Van Gogh \$19,000, and water colors by these artists and by Picasso approximately \$1500 each. At the Stonborough sale a still life by Matisse brought \$10,400; a nude by Toulouse Lautrec \$5200; "Le Violoncelle," by Gauguin, \$4100, and "Le Chien," by Picasso, \$3800. At this same sale a portrait drawing by Ingres went for \$1050.

The most important sale in England was that of the George Eumorfopoulos collection, May 28-31 and June 5-6, at which a total of £35,873 was realized. This collection was especially rich in Chinese bronzes and porcelains. Some of the pieces sold and bringing record prices were shown in 1939 as loans in the Golden Gate Exposition, California. The modern paintings and other works of art in this collection were sold separately on June 12-14 and realized £1949. The top price, £530, was paid for a portrait by Modigliani of his wife in black dress.

The print section of the Ryan collection brought a total of \$156,205, and its dispersal was accompanied by several unusual occurrences. There was an unusually large and distinguished audience in attendance, including bidders from Europe as well as this country, and many of the items were sharply contested for. An offer of \$28,000 was made for a set of 20 etched portraits by Van Dyck and refused. When sold separately the series brought a total of \$40,000—one single print, a brilliant impression of a self portrait, brought \$6500. Other high prices at this sale were: \$6700, paid by a Brussels dealer for "The Three Trees" by Rembrandt; \$4500 for his famous "Hundred Guilder" print; \$4300 for his "Christ Crucified between Two Thieves," and \$4600 for Martin Schongauer's engraving, "Saint Sebastian."

At the Holden sale the following prices were paid for etchings by later day masters: Whistler, "Nocturne" \$575, "The Steps" and "The Balcony," \$375 each; Seymour Haden, "The Early Riser," \$450; Zorn, "St. Ives," \$550, and Meryon, "Le Petit Point," \$300. Two lithographs by Bellows—"Stag at Sharkey's" and "Dempsey and Firpo"—at the Pulitzer sale realized \$550 and \$450 respectively. A portrait of Lincoln painted at the time of his nomination as a presidential candidate by Thomas Hicks, and long thought lost, appeared at the Edson Bradley sale and brought \$11,100.

**Museums.** A momentous event chronicled in 1940 in connection with American Art Museums was the announcement in October of the gift of the Widener Collection to the National Gallery of Art. This collection, formed by the late Peter A. B. Widener of Lynnewood Hall, Elkins Park, Pennsylvania, has been enriched and upheld to a very high standard by Joseph E. Widener, his son, from whom it will pass to the Nation. It comprises approximately one hundred paintings by great masters as well as fine examples of Renaissance sculpture, the celebrated Mazarin tapestry, rare porcelains, crystals, and jewels. Outstanding among the paintings are the little "Cowper Madonna," by Raphael; "The Mill," by Rembrandt, and two famous portraits by this master from the Yousoupov Collection; "The Feast of the Gods," by Bellini, and "Woman Weighing Gold," by Vermeer, be-

sides others scarcely less famous. Two important modern works are included—"Dead Toreador," by Manet, and "La Danseuse," by Renoir.

Earlier in the year, the National Gallery of Art received from the Mellon Educational and Charitable Trust the gift of eleven early American portraits which had been acquired by Mr. Andrew W. Mellon and held in reserve. Five of these were by Gilbert Stuart, in addition to which were single examples by Copley, West, Trumbull, Savage, Mather Brown, and Chester Harding.

The National Gallery of Art, given by Mr. Mellon, and erected on the north side of the Mall, between 5th and 7th streets, Washington, D.C., was begun in March, 1938 and practically finished in December, 1940, at which time it was turned over to the trustees and promptly occupied by the director, Mr. David E. Finley, and his staff. The expectation was at that time to open it to the public in March or April, 1941. This building, classical in design, is of rose-white Tennessee marble, 785 feet in length, and affords space for 100 separate exhibition rooms on its main floor. In the center is a rotunda 100 feet in diameter beneath a dome supported by 24 Ionic columns of dark green marble. Directly beneath the dome is a fountain surmounted by a bronze statue of Mercury by Giovanni da Bologna. Two interior courts ornamented by fountains with sculptural adornment are also special features. The building is, of course, air-conditioned and up-to-date in every particular.

Also of national importance was the opening, on November 1st, of the Dumbarton Oaks Research Library and Collection of Byzantine and Medieval Art on Georgetown Heights, Washington, at which time it was announced that conveyance was to be made immediately to Harvard University by Mr. and Mrs. Robert Woods Bliss, through whom, during a considerable number of years, it had been assembled. (The transfer has since taken place.) Included with the gift was the Bliss home (adjacent to which the new buildings have been erected), henceforth to be used as a residence for visiting research scholars. Source material of the periods covered is still, even among our art museums, extremely rare.

In April the Philadelphia Museum of Art opened three new sections: a wing of Oriental art, a hall incorporating features from the Sasanian Palace at Damghan, and a Ming Palace Hall from Chao Kung Fu, Peiping.

The Worcester Art Museum, Worcester, Mass., added several new galleries in 1940 by raising its roof and side walls. The Yale Art Gallery, previously governed by the School of Fine Arts of Yale University, was separated and made a university unit with a director and governing board of its own, thus broadening its scope.

Financed by a grant from the General Education Board, five Art Museums—The Art Institute of Chicago, Albright Art Gallery of Buffalo, Cleveland Museum of Art, Milwaukee Art Institute, and Museum of Modern Art of New York—each developing its own program but profiting by the experience of the others, endeavored to find ways of working more effectively with secondary schools in an effort to increase knowledge and appreciation of art among boys and girls during their formative years.

The Art Institute of Chicago in co-operation with the University of Chicago offered a special course for those desiring to qualify as curators and docents. The Worcester Art Museum, in like man-

ner co-operating with Clark University, offered in the fall of 1940 special courses for university students in drawing and painting as well as the history of art.

Several of the art museums throughout the country tried the experiment of introducing individual artists to the public through the medium of a broadcast sponsored by the National Art Society over the N.B.C. network entitled "Art for Your Sake." Each museum showed at the time color reproductions of paintings by the artist discussed and impersonated.

The Chicago Art Institute received from Mary Morley Sellers of San Francisco a \$100,000 bequest to found a chair of painting or decorative arts in connection with its school. Through an anonymous donation of \$10,000 the Virginia Museum of Art, Richmond, was enabled in 1940 to set up a series of art fellowships or grants-in-aid to students of art under the age of 38—each for a five-year period of study.

There were fewer large bequests or gifts to art museums in 1940 than in previous years—but some that were notable. Edgar P. McBurney left \$1,000,000 to establish an art center in Atlanta, Georgia, subject to a life interest to his widow. Duke University, Durham, N.C., received, by bequest from William Hayes Ackland, \$300,000 to build an Art Gallery on the campus, his own private collection of sculpture, and an additional fund for acquisitions. The Dudley Peter Allen Memorial Museum at Oberlin College received a gift of \$25,000 from Mrs. R. T. Miller, Jr., for the purchase of works of art. The University of Southern California was enriched by an art gallery and 29 works by the old masters, the gift of Mrs. Walter Harrison Fisher. The California Palace of the Legion of Honor received 72 paintings from Mr. H. K. S. Williams (in memory of his wife) and the Baltimore Museum a very handsome Jacobean room with complete furnishings, the gift of Mrs. Sadie A. May.

The State of Nevada purchased from the Federal Government the old Mint building at Carson City, at a cost, as it is no longer in use, of only \$5000. The Legislature authorized conversion of the building into quarters for the Nevada Museum and Art Institute.

The fireproof building in which "The Masterpieces of Art" were displayed at the New York World's Fair was given at the conclusion of the Fair to the City of New York as a permanent Art Gallery by Art Associates, Inc.

An award for distinguished services rendered to the cause of Museum administration was established in 1940 by Mr. Henry W. Kent, for many years secretary of the Metropolitan Museum of Art. A first award was made to Laurence Vail Coleman, director of the American Association of Museums.

The Metropolitan Museum of Art announced in midsummer 1940 that, beginning in the autumn, 500 paintings from the Museum's permanent collection would be made available to other museums and art associations throughout the country for exhibition as loans on very liberal terms.

There was a great shifting about of art museum directors in 1940 but comparatively few new recruits. Francis H. Taylor, for some time director of the Worcester Art Museum, became director of the Metropolitan Museum of Art and Horace H. F. Jayne of the Museum of the University of Pennsylvania, assistant director. Charles H. Sawyer of the Addison Gallery, Andover, took the place left

vacant by Mr. Taylor at Worcester and his assistant, Bartlett H. Hayes, succeeded him at Andover.

Important acquisitions to permanent collections were made through purchase by the Museum of Fine Arts, Boston, the Metropolitan Museum of Art, New York, Detroit Art Institute, St. Louis City Museum, John Herron Art Institute, San Diego Museum, Frick Collection, Phillips Memorial Gallery, and others. In most instances these were works by European masters of long established reputation from funds given and invested for such purpose. The John Herron Art Institute, however, bought a Gilbert Stuart and an Eakin, and the Frick Collection's acquisition was a "Portrait of Uncle Dominic as a Monk" by Cezanne.

**Exhibitions.** Exhibitions of works of art continued to increase in number as well as note during 1940, the peak being reached when 1000 special sales exhibitions were put on throughout the country during National Art Week (see below).

Throughout the year art museums vied with one another in setting forth exhibitions of masterpieces of art. These in some instances were assembled independently but more often through collaboration. An instance of the latter was the exhibition of Italian Masterpieces, 21 paintings and 7 works in sculpture, shown in the Golden Gate Exposition of 1939, which in 1940, were shown first in the Art Institute of Chicago and then in the Museum of Modern Art, New York. The attendance in Chicago was 265,679 and in New York, for a slightly longer period, 290,888.

Likewise a group of art museums—those of Cleveland, Pittsburgh, St. Louis, Minneapolis, Los Angeles, and Newark—co-operated in circulating an exhibition composed of 46 paintings by great European masters selected from the Masterpieces of Art exhibitions held the previous year in the east and west coast expositions. These were loans from France, Holland, Belgium, and other countries involved in the War, which could not safely be returned, hence remained in the United States under special protectorate.

The art museums took active part in assembling the "Masterpieces of Art" exhibitions for the 1940 World's Fairs, the work being largely delegated to museum directors and staff experts, and loans made by the institutions and their patrons. The amazing wealth of such available material in the United States was thus again tangibly manifested.

The Contemporary exhibitions at both Fairs were better in 1940 than in the preceding year, and in both demonstrations of art-in-the-making were well used to enhance interest and increase educational value.

Among the exhibitions independently organized by various museums the outstanding were the following: "Seven Centuries of Art from Bellini to Luigi Lucioni"—250 works lent chiefly by museums and valued at over \$6,000,000—shown in the Palace of the Legion of Honor and the M. H. de Young Museum, San Francisco; "Medieval Art from 1000 to 1400 A.D."—320 objects lent by the Morgan Library, N.Y., the Walter's Gallery, Baltimore, and 50 other institutions, as well as drawn from the exhibiting museum's collection—set forth in the Museum of Fine Arts, Boston; "Four Centuries of Venetian Art"—70 paintings and 30 drawings from American collections assembled by Hans Tietze for the Toledo Museum of Art; "Chinese Ceramics"—328 pieces dating from 2000 B.C. to the 18th Century A.D.—displayed in the Cleveland Mu-

seum of Art; also notable exhibitions of Pre-Columbian Art in Los Angeles and in the Fogg and Peabody Museums, Cambridge, Mass.

There were also important loan exhibitions of masterpieces held in dealers' galleries in New York for war relief and other charitable purposes.

Two memorable exhibitions of art from other countries were held in New York City in the summer of 1940. These were a magnificent exhibition of Persian Art, comprising over 3000 items lent by 30 museums and 60 private collectors, valued at \$10,000,000, which was assembled by Arthur Upham Pope and shown under the auspices of the American Institute for Iranian Art and Archaeology; and "Mexican Art of Twenty Centuries," which also included 3000 items and was displayed in the Museum of Modern Art.

Especial emphasis was placed in 1940 on the art of South and Central America, partly because of our isolation from Europe and not a little as the result of efforts put forth by the Committee on Cultural Relations with these countries, appointed by and functioning under the Department of State.

In the Virginia Museum, Richmond, an important exhibition of 236 paintings and 76 works in sculpture by artists of Argentina was shown in January, a section of which was later circulated by The American Federation of Arts. In the autumn, a collection of paintings—two each—from the republics making up the Pan American Union, assembled by the International Business Machines Corporation for display in the two World's Fairs in 1939, was shown in the Corcoran Gallery of Art, Washington, D.C., in celebration of the fiftieth anniversary of the founding of the Union. Also under the auspices of the Federal Government a noteworthy collection of portrait drawings of Indians of the two Americas by Eben F. Comins was shown in the Art Gallery of the Department of the Interior.

There were several interesting one-man exhibitions in this same category. Candida Portinari of Brazil exhibited in the Detroit Art Institute and the Museum of Modern Art, N.Y.; Gomez Campuzano of Colombia displayed his paintings in a dealer's gallery, New York, and Antonio Ortiz Echague, a Spanish artist now residing in Argentina, was honored by a one-man show in the Carnegie Institute, Pittsburgh.

Mention should also be made of exhibitions of prints by Contemporary American Printmakers, assembled by the National Society of Engraving, which were sent by special invitation to Uruguay and, under the auspices of the Pan American Union, on a circuit of South American cities.

It should not be thought that the majority of the exhibitions held in 1940 were either foreign or retrospective. An exhibition of the works of leading Impressionists held in the Los Angeles Museum attracted 136,000 visitors in three weeks. The Detroit Art Institute put on an important exhibition entitled "The Age of Impressionism—Objective Realism" which had direct bearing on the art of today. One-man exhibitions of paintings by Picasso, Braque, and Rouault, high lights in the galaxy of Post-Impressionists, were widely circulated.

Outstanding among exhibitions of American art was the "Survey" from 1670 to the present time, substituted by the Carnegie Institute in 1940 for its usual International exhibition. There were 270 paintings in the retrospective section and 121 in the contemporary section. No prizes were given, but \$5000 was spent for purchases from the latter.

An elaborately illustrated and annotated catalogue was issued.

The Museum at Yale University showed in 1940 an exhibition of "Eighteenth Century Landscape Painting" and the Hartford Museum one of "Industrial Scenes for Five Hundred Years." The Gibbes Memorial Museum, Charleston, S.C. illustrated pictorially the "History of the City (Charleston) in Art."

One-man exhibitions honoring the following deceased American artists were held: John H. Jarvis, portrait painter, 100 works, assembled and shown by the New York Historical Society; Eastman Johnson, genre painter, the Brooklyn Museum; George Bellows, painter and lithographer, the Columbus Gallery of Art.

Exhibitions purposed to make visitors think, as well as to attract attendance, were held under rather startling titles such as "Taste is not Spinach" (Virginia Museum); "Modern Isms and How They Grew" (Baltimore Museum) and "The Art the People Live With" (San Francisco Museum).

An experiment which seemed to bring forth good results was tried by the Art Alliance of Philadelphia in connection with an exhibition, "American Taste in Art," for which the pictures were selected and awards made by a specially invited jury of prominent Philadelphia business men and executives thought to be "completely non-art-conscious," but whose judgement met with almost universal public approval.

Important exhibitions of sculpture were held in New York and Philadelphia; the former a "Sculpture Festival" staged by the National Sculpture Society in the Whitney Museum; the latter an International show held in the Philadelphia Museum and adjacent thereto, under the auspices of the Fairmount Park Art Association.

An exhibition of American Industrial Art was held at the Metropolitan Museum of Art during the summer of 1940, and in the Art Museum at Syracuse, N.Y., a notable exhibition of ceramics by contemporary workers was put on in the autumn.

The National Society of Mural Painters held an extensive exhibition in the Whitney Museum toward the last of the year.

An exhibition of the "Art of the Negro," for the past 90 years, was shown in the Tanner Galleries, Chicago, from July to September in connection with the American Negro Exposition.

And still nothing has been said of the exhibitions held as usual annually by the leading professional organizations, such as the National Academy, the Pennsylvania Academy, Water Color Societies, and Print Clubs, which most fully represented trends of the day and the state of art among us—nor for that matter of the innumerable one-man exhibitions in dealers' galleries which likewise betokened vitality and continuity of effort.

**National Art Week.** National Art Week—November 25 to December 1—was instituted in 1940 by the President of the United States to improve economic conditions in this field. According to statistics gathered by governmental agents the attendance at art exhibitions during the year had increased to about one third of the entire population, but sales had so fallen off that the majority of the artists had been unable to support themselves through their art and the books of but a few of the art dealers showed a profit. Whereas, when the Governmental Art Projects were set up early in President Roosevelt's first administration it was said that because of reduction in surplus income due to

increased taxation it was the duty of the Government to assume patronage, it was stated in connection with National Art Week that it was the public to whom the artists must look for the stabilization of an art market. The result of the one thousand sales exhibitions held throughout the country under this impetus was reported to total approximately one hundred thousand dollars.

**Other Developments.** Notwithstanding the discouraging economic outlook the art schools of the country were crowded to overflowing and the summer art schools were more than full in 1940.

A brighter side of the picture was found in the accomplishment of certain artists, well trained and equipped, and in patronage which originated in the business world. For instance: for display in their own concessions at the two World's Fairs of 1940, the International Business Machines Corporation assembled through direct purchase two exhibitions, consisting of one painting each by an outstanding artist, in every one of the forty-eight States, District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands, selection being made by local expert juries. In addition, \$3000 was distributed in cash prizes for the finest works in each group, and at the close of the Fairs both groups were sent out on circuit to art museums at the expense of the owners and shown with great distinction.

An alliance was also affected between the motion picture industry and the painters' art through the co-operation of a well known producer—Walter Wanger—and the Associated American Artists. Nine members of the latter were invited to go to Hollywood, witness the filming of Eugene O'Neill's "Long Voyage Home," and place their interpretations of characters and scenes on canvas for the tidy sum of something like \$10,000 each, including traveling expenses. This group of paintings was also sent out on circuit and was shown in art museums in various large cities while the film was running in a local theater; the result was to establish contact in the public mind between the art of film making and that of painting.

Disputes which threaten to disrupt the organization arose among members of the American Artists Congress concerning beliefs in or definition of fascism and communism. Also effort on the part of the director of the WPA Art Projects in New York to raise the standard of production by appointing a jury of experts to pass upon all work sent in, met with violent opposition on the part of those employed, particularly C.I.O. Artists Union members who claimed that this was actually a means of shifting responsibility for dismissals. A delegation went to Washington and picketed the White House; threatening letters were sent to members of the jury some of whom resigned, but General Somerville, in charge, refused to make concessions.

**ASBESTOS.** The Province of Quebec, which is the principal source of Canadian asbestos, produced 345,581 tons of all grades in 1940, compared

with 364,454 tons in 1939. The 1940 production was classified as follows: Crude 2076 tons; fibers, 181,890; shorts, 161,615. Despite the loss of European markets, the volume of Canadian business was about the same as in 1939, and all producers were operating at capacity. Prices were substantially unchanged, except for an increase of 10 per cent in short fiber. At the close of 1940 the following prices prevailed per ton for No. 1 crude: Quebec, f.o.b. mines, \$700 @ \$750; Rhodesian, c.i.f., New York \$300; Russian, c.i.f., New York \$275. The U.S. Government made some small purchases for a stockpile of this material. No technical developments were noted, but new competition in heat insulation was offered by glass wool, mineral wool, and slag wool.

The 1939 census of manufactures in the United States shows that the domestic asbestos industry produced 15,300 short tons of asbestos of various grades, with a value of \$484,000. Although the 1939 value was 22 per cent higher than that of 1929, and the production over 300 per cent greater, the United States continues to be dependent on imports. In 1939 only about 6 per cent of crude asbestos consumption came from domestic mines. Canada supplied 92 per cent of our imports.

The 1939 census shows employment of 151 wage earners receiving \$146,000 in wages, or about 44¢ per man-hour.

Production of asbestos in 1939 was reported from Vermont, Arizona, Georgia, and Maryland.

**ASTRONOMY.** Several contributions of note were made during the year on meteors and their origin. Meteors are small fragmentary particles of iron or stone which on entering the earth's atmosphere at high velocity become visible and in general are completely vaporized. These flashing meteors, which are the smallest of astronomical bodies, ranging in size from a grain of sand to boulders weighing many tons, constantly bombard our earth. It has been estimated that over one hundred million meteors strike the earth's atmosphere each twenty-four hours. Meteors travel at the very high speeds of from twenty to fifty miles a second; were it not for the earth's atmosphere acting as a protecting blanket living conditions would be chaotic, a rain of meteoric missiles would bombard us with deadly effect and the very exist-

ence of life on this planet would disappear. As a result of the fact that most meteors are completely vaporized thousands of tons are being added to the earth's mass each year through the meteoric dust thus formed. However this should not cause undue alarm for it would require many millions of years for a layer of meteoric dust to spread evenly an inch thick over the entire surface of the earth. Authorities are not in agreement on the precise rate of settlement and spread of meteoric dust so that no exact value can be given.

Not all meteors are completely vaporized while passing through the earth's atmosphere; some pass out into space again, though of reduced size, others upon rare occasions fall to the earth. Meteors which fall to the earth are called meteorites. Authorities have estimated that approximately 90 per cent of the original mass of a meteorite is fused away during its flight through our atmosphere and that only 10 per cent of the original body reaches the earth in compact form. Some meteors explode while passing through the air, these are called bolides or fireballs. Some thirty of the chemical elements have been identified in meteorites, these are called siderites. Silicon in the form of silicates predominates in other meteorites and these are called aerolites. The chemical elements identified in meteorites tell us something of the physical constitution of other heavenly bodies and lead us to the conclusion that matter contained in the earth, the other planets, the stars, and in all bodies throughout the universe, is identical to that known to man, though not necessarily in the same form. No meteorite has ever been found which consisted of the sedimentary or metamorphic rocks common to the earth such as limestone, sandstone, and the like.

The largest stony meteorite seen to fall in modern times weighed about 800 lb and fell through our atmosphere on Feb. 17, 1930, burying itself to a depth of nine feet in the ground on a farm at Paragould, Ark., from which it received the name "The Paragould Aerolite." It is now on display in the Field Museum of Natural History. Larger meteorites have been found which were not observed to fall; the largest one on display is the Greenland Meteorite in the American Museum of Natural History.

From times when meteors were objects of worship by superstitious peoples, right thinking men have attempted to solve the problem of where meteors come from. Theories have been advanced that meteors are the fragments which were left over when our solar system was formed; that meteors are the congealed remains of gigantic solar eruptions; that meteors have been attracted to our solar system by gravitational influence which harnessed them during the flight of our solar system through space; and still another theory (though this seems least plausible) is that meteors are the result of the eruption of lunar volcanoes many ages ago. Possibly there is some truth in all these hypotheses. It is now well known that in addition to the sun, the planets and their satellites, the solar system is also composed of comets and meteors, and that regardless of the origin of meteors, there are many well marked groups of meteors, which travel in elliptical orbits around the sun and appear at definitely known periods. Such groups of meteors move along more or less parallel paths and when their path and that of the earth intersect the meteors seem to radiate from a point in the sky known as the radiant, the shower being generally

identified with and named after the constellation in which the radiant is located. In addition to these well marked groups of meteors, meteor trails may be seen almost every clear night and when such a meteor trail cannot be identified as coming from one of the group it is termed a sporadic meteor. It is now commonly accepted that there is a very close relationship between comets and the meteors observed in meteor showers. In the year 1826, Biela, a German astronomer, made a special observation of a comet which now bears his name, and which had been observed by others in 1772 and 1805. Its period was computed as being approximately 6.75 years. It was observed at each return until November, 1845, when what was regarded as one of the most remarkable phenomena in the history of astronomy was actually observed to take place; on Dec. 19, 1845, two American astronomers, Herrick of Yale University and Bailey of New Haven, noticed that Biela's comet had assumed a pear shape. Lt. M. F. Maury of the U.S. Naval Observatory, was the first astronomer to notice that ten days later it had divided into two separate but unequal parts; two English astronomers, Challis and Hind had also noticed this phenomenon. The two parts, separated by a distance of 165,000 miles continued on the comet's regular orbit until lost to sight. Astronomers watched carefully for the reappearance of the comet and, at their return in August, 1852, it is recorded that the two parts had separated to a distance of some 1,500,000 miles and that although the larger of the two divisions preceded the smaller by three weeks, both appeared equally bright. As comet bodies they are forever lost, for the next time the comet was due they failed to appear. However, on the night of Nov. 27, 1872, as the earth crossed the orbit of Biela's comet, a dazzling display of meteors was observed. This meteor shower was again observed in 1885 and in 1892 at the time when Biela's comet would normally have been seen. Biela's comet has not been observed since 1852 and it is now assumed that comets are only temporary bodies which sooner or later break up into smaller bodies or disintegrate into showers of meteors which may be seen only when their orbit and that of the earth intersect.

Great showers of meteors always seem to occur when the earth intersects and crosses the orbits of comets. Schiaparelli of Milan became interested in this field of astronomical knowledge and in 1866 investigated the well known August shower of meteors, the Perseids. He pointed out the marked resemblance between the parabolic elements of this meteor group with the elliptical elements of Swift's comet and arrived at the conclusion that the general resemblance was too great to permit any doubt that the comet and meteors were moving in orbits of identical form. He therefore reasoned the Perseid shower of meteors should be identified with Swift's comet. He found a similar resemblance between the Leonid shower of meteors and Tempel's comet. Weiss found the Andromede shower of meteors to be connected with Biela's comet and also that the Lyrid shower could be identified with Thatcher's comet. Since the work of Schiaparelli and Weiss other astronomers have found the orbits of the Aquarid shower and Halley's comet in agreement, and in 1916, Olivier and Denning independently found a connection between the meteors from a radiant in Ursa Major and the Pons-Winnecke comet. Astronomers have also found that the Draconid meteor shower moves in the path of Giacobini's comet. It appears con-

clusive that comets which are now pursuing their orderly way through our solar system throw off and leave in their wake streams of meteors which continue to follow the same orbit as that of their parent comet.

Whipple, of Harvard University, has just pointed out that there is a connection between the Taurid shower of meteors and Encke's comet. From observations of the Taurid meteors, made with special cameras, Whipple found that their speed was about 23.5 miles a second and that they were moving in a closed path; the paths of the meteors and Encke's comet are similar except that the planes of the two orbits are at an angle of about 12 degrees. Whipple has worked out a new mathematical theory for Jupiter's gravitational effect on the comet. From his theory he concludes that the plane of Encke's comet changes over a long period of time; ages ago the orbits of the comet and meteor shower were in the same plane and have since separated. Whipple believes that the Taurid meteors did not arise from Encke's comet but rather that the two have a common ancestor, some large comet which broke up into several smaller ones; one of the smaller descendants can still be seen alive as Encke's comet, while only the skeletal remains of others occasionally collide with the earth to produce showers of meteors. Whipple estimates that the disintegration of the parent comet took place between five and fifteen thousand years ago, a very short time indeed when compared with the age of the solar system itself.

Whipple's contribution to the connection between comets and showers of meteors is an important one and sheds new light on a subject which has had a long and interesting history. However, while it is now well established that showers of meteors originate from and are associated with comets, the next question is how, or where, do comets originate? The problem of the origin of sporadic meteors and of comets, like the problem of the origin of the solar system, is not yet settled with complete satisfaction.

Herbig, of the University of California, has made new calculations on the diameters of some of the large stars and found Ras Algethi, in the constellation of Hercules to be the largest. Heretofore, Antares, had been regarded as the largest star. Herbig, using distance determinations furnished by van Maanen, determined the diameter of Ras Algethi as nearly four times that of the earth's orbit.

Strand, of Swarthmore College, has just made a study of the famous double star, Zeta Aquarii. From very accurate photographic measurements Strand finds that there is a regular fluctuation from the expected motion and concludes that there is a third invisible member of the system. The invisible companion has a mass about one fourth that of the sun, while the mass of the entire system is four times the sun's. The two bright stars which belong to Zeta Aquarii can be seen in a telescope and are separated by a distance eighty-five times that from the sun to the earth, the invisible companion revolves around the brighter of the other two.

Wildt has made an interesting contribution to our ideas of the atmosphere of the planet Venus. The existence of a dense atmosphere on this planet has long been recognized by astronomers, but until 1932 there was no information as to its composition. In that year Adams and Dunham, at Mount Wilson, secured high dispersion spectra of Venus

in a search for oxygen and water vapor. They found no trace of these gases. However, three bands of unknown origin were discovered at wavelengths 7820, 7883, and 8689 Angstroms in the infra-red part of the spectrum; they tentatively assigned these bands to carbon dioxide. In 1934 Adel and Slipher were able to produce these bands in the laboratory and they finally concluded that carbon dioxide was a common constituent of the atmosphere of Venus. Wildt has made a theoretical investigation and believes that formaldehyde is present in the atmosphere of Venus.

**Phenomena.** At February's end and early in March there was a most unusual distribution of planets in the evening sky. The six brightest major planets were all well placed for observation in the western evening sky and lay along the ecliptic in a zone roughly fifty degrees in length. Mercury was near the western horizon followed in order by Jupiter, Venus, Saturn, Mars, and Uranus. The five naked eye planets were within forty degrees of each other.

During 1940 two conjunctions of Jupiter and Saturn occurred on August 15 and October 11 respectively. These two conjunctions were part of a so-called "triple conjunction"; the third conjunction of this series will take place on Feb. 20, 1941. Triple conjunctions of Jupiter and Saturn are known to be rare though there is some disagreement as to exactly how often they take place.

On November 11 and 12 a transit of Mercury over the sun's disc took place and was successfully observed.

There were two eclipses of the sun in 1940, one annular and one total. For the total one the path of totality was visible from South Africa and the northern part of South America. The war reduced the number of scientific expeditions sent to observe this eclipse; two expeditions were sent from the United States, one to South Africa and one to South America.

There were five or six comets observed in 1940. Comet 1940a (Kulin) first reported as Asteroid 1940AB. The high eccentricity of this object made its discoverer in Budapest believe it a comet. Its discovery was not confirmed by any astronomers in America; if accepted this is a new comet. There is no doubt about the other five comets which were observed. Comet 1940b, a return, was Comet Schwassman-Wachmann I (1925II). The return of this comet was first observed by Hirose of Tokyo on July 4; this comet has very striking changes in brightness and appearance. Comet 1940c, a return was comet 1933f (Whipple). The return of Whipple's comet was first observed on September 1 by Cunningham; it was discovered Oct. 21, 1933, and observed till Jan. 31, 1935; the orbit and computed position from those observations were found, on the comet's present return to be only six minutes in error, a very small error. The period of this comet is 7.5 years. Comet 1940d was a new comet, Cunningham. This new comet received much publicity because it was the brightest comet since Halley's comet in 1910. Cunningham's comet was discovered on September 5 at the Oak Ridge station of the Harvard Observatory. After its discovery it was located on photographic plates taken on August 25. At the time of its discovery its brightness was estimated as magnitude 12.9. It was soon evident that this comet would be visible to the unaided eye; however at the time the comet was bright enough to be visible without a telescope, it was very close to the sun and could

be seen for only a short time after sunset. Comet 1940e was a new comet, Whipple; it was discovered on September 30 although it was subsequently located on photographic plates taken as early as July 29. Comet 1940f was a new comet discovered by Okabayasi at Tokyo on October 4.

**AUSTRALIA.** A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra.

**Area and Population.** The area of the six States and two Territories, the census population of June 30, 1933, and the estimated population on Mar. 31, 1940, exclusive of aborigines, are shown in the accompanying table.

AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in sq miles	Population	
		June 30, 1933	Mar 31, 1940
New South Wales	309,433	2,600,847	2,775,871
Victoria	87,884	1,820,261	1,896,934
Queensland	670,500	947,534	1,018,362
South Australia	380,070	580,949	597,387
Western Australia	975,920	438,852	466,686
Tasmania	26,215	227,599	239,574
Northern Territory	523,620	4,850	7,258
Australian Capital Territory	939	8,947	12,843
Total	2,974,581	6,629,839	7,014,915

The estimated population increase for the year 1939 was 67,635, of which 13,891 represented net immigration and 53,744 the excess of births over deaths. Estimated populations of the chief cities, all of them State capitals, on Dec. 31, 1939, were: Sydney, N.S.W., 1,302,890; Melbourne, Victoria, 1,046,750; Brisbane, Queensland, 326,000; Adelaide, South Australia, 322,990; Perth, Western Australia, 224,800; Hobart, Tasmania, 65,450. Canberra, the Federal Capital, had 10,420 inhabitants. Newcastle, N.S.W., had 104,485 inhabitants at the 1933 census.

**Overseas Territories.** The overseas territories under the Commonwealth's political control are shown in the table on page 48.

**Education and Religion.** Elementary education is free and compulsory. About 15 per cent of the adult population is illiterate. In 1938 there were 10,029 State schools with an enrollment of 934,990. Private schools in 1937 numbered 1880 with an enrollment of 235,815; free kindergartens, 72 with an average attendance of 3202. The six State Universities had 11,098 students in 1937. Religious affiliations at the 1933 census were: Church of England, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist, 684,022; Catholic (undefined), 127,542.

**Production.** The estimated gross value of production, by chief industries, for the fiscal years

AUSTRALIAN OVERSEAS TERRITORIES<sup>1</sup>

<i>Territory (Capital)</i>	<i>Area, sq. mi.</i>	<i>Population</i>
Australian Antarctic Territory <sup>2</sup>		
New Guinea, Territory of <sup>3</sup> (Salamaua)	93,000	560,935 <sup>4</sup>
North East New Guinea	69,700	499,741 <sup>4</sup>
Bismarck Archipelago	19,200	15,284 <sup>4</sup>
Solomon Islands	4,100	45,910 <sup>4</sup>
Papua, Territory of <sup>5</sup> (Port Moresby)	90,540	338,608 <sup>4</sup>
Nauru <sup>7</sup>	8	3,383 <sup>4</sup>
Norfolk Island	13	1,059 <sup>4</sup>

<sup>1</sup> The Territory of Ashmore and Cartier Islands off the northwest coast of Australia was placed under the authority of the Commonwealth of Australia by Imperial Order in Council of July 23, 1938. <sup>2</sup> The Australian Antarctic Territory includes all the islands and territory, except Adelaide Land, situated south of 60° S latitude, and between 160° E longitude and 45° E longitude. <sup>3</sup> Mandated to Australia by the League of Nations in 1920. <sup>4</sup> Includes Europeans, Asiatics, and natives enumerated on June 30, 1938, but does not include those natives living in areas not yet under government influence. <sup>5</sup> Enumerated natives in 1938. <sup>6</sup> Formerly known as British New Guinea. <sup>7</sup> Mandated to the British Empire by the League of Nations and administered under an agreement among Australia, Great Britain, and New Zealand. <sup>8</sup> 1939 estimate. <sup>9</sup> June 30, 1938.

ended June 30, is shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION

[In thousands of pounds sterling]

<i>Item</i>	<i>1937</i>	<i>1938</i>	<i>1939</i>
Agricultural	£ 91,403	£ 93,229	£ 76,851
Pastoral	105,499	100,794	84,895
Dairy, poultry, bee-farming	49,886	57,641	60,404
Forestry and fisheries	11,765	14,755	14,634
Mining	27,381	32,434	32,463
Manufacturing <sup>a</sup>	170,811	188,061	195,746
Total	£456,745	£486,914	£464,993

<sup>a</sup> Value added in process of manufacture

The total area under crops for 1938-39 was 23,497,780 acres and production was: Wheat, 155,368,621 bu (210,160,318 in 1939-40); oats, 15,554,735 bu; corn, 7,056,642 bu; hay, 3,321,161 tons; cane sugar, about 838,000 tons (for calendar year 1939). Livestock in 1938 included 111,057,832 sheep, 12,861,781 cattle, 1,741,056 horses, and 1,154,052 swine. The 1939-40 wool clip, as in the grease, totaled 1,109,035,000 lb. Production of butter in 1938-39 was 455,834,329 lb.; cheese, 65,645,989 lb.; bacon and ham, 74,453,963 lb. Gold output in 1939 was 1,645,697 fine oz.; black coal, 13,535,206 tons; pig iron, 1,104,605 tons (in 1938-39). In 1938 copper output was 20,326 tons; lead, 239,590 tons; silver, 13,895,541 oz.; tin, 3331 tons; zinc, 163,381 tons. Exploitation of shale oil deposits began in 1940 (see *History*). Manufacturing statistics for 1938-39 were: Establishments, 26,941; employees, 565,106; salaries and wages, £106,743,062; value of output, £500,419,977; value added during production, £203,416,610.

**Foreign Trade.** For the fiscal year ended June 30, 1940, merchandise imports were £115,705,084 (£102,156,352 in 1938-39) in British currency values; direct overseas exports, £145,589,334 (£140,496,312) in Australian currency values. The chief 1939-40 exports were: Wool, £52,952,843; butter, £15,484,540; meats, £15,109,148; gold, £12,694,786 in 1938-39; wheat, £7,530,490; flour, £5,258,365; silver and lead, £6,533,176; skins and hides, £4,157,709. For distribution of trade, see *YEAR BOOK*, 1939. Also see *TRADE, FOREIGN*.

**Finance.** Receipts of the Consolidated Revenue Fund for the 1939-40 fiscal year totaled £111,913,784 (£95,064,790 in 1938-39); expenditures, £108,-

985,409 (£94,437,481). Defense expenditures for 1939-40 amounted to £55,200,000, of which £28,814,046 came from the General Loan Fund and the balance from revenue. The preliminary budget estimate for 1940-41 placed revenues at £150,000,000, of which £A85,000,000 was required for normal services, and expenditures at £A276,000,000 (£A186,000,000 for defense). Of the war expenditure, £A65,000,000 was to come from tax income and £A121,000,000 from loans, etc. The Commonwealth debt on June 30, 1940, was £435,327,180 (£397,250,931 on June 30, 1939); total debt of States, £905,727,064 (£897,772,042). The Australian pound (£A) averaged \$3.5338 for 1939 and \$3.0516 for 1940.

**Transportation.** Federal and State railways in operation June 30, 1939, totaled 27,234 miles; private (general traffic) lines, 765 miles. Gross earnings of government lines, 1938-39, £44,780,000; operating expenditures, £35,958,000. Highways extended over 486,000 miles. The Commonwealth's second largest bridge was opened across the Brisbane River at Brisbane July 6, 1940. There were 30,245 route miles of civil air lines on Jan. 1, 1939. During 1938-39 a total of 3814 ships of 13,545,712 tons entered and cleared Australian ports. A £3,500,000 port improvement project was under way at Melbourne in 1940.

**Government.** Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each State), elected for 6 years and renewed by half every 3 years, and a House of Representatives of 74 members apportioned among the States on a population basis and elected for 3 years. Governor-General, Brig. Gen. Alexander Gore Arkwright, Baron Gowrie, who assumed office Jan. 22, 1936. Robert Gordon Menzies (United Australia party) became Prime Minister Apr. 26, 1939. For developments in 1940, see *History*.

HISTORY

Like the other British Dominions, Australia received a profound shock when the German *blitzkrieg* in May and June overwhelmed the Low Countries and France and threatened Britain with imminent invasion and destruction. The entry of Italy into the conflict and Japan's subsequent alliance with Germany and Italy added to the Commonwealth's alarm and fear as to its future security. Without wavering in its loyalty to the mother country, Australia hurriedly prepared to increase its contribution to the defense of the Empire while at the same time intensifying preparations for home defense. The Commonwealth also sought closer relations with the United States as a precaution against possible collapse of British resistance and Japanese aggression.

**Political Developments.** The weak position of the Menzies Government (see 1939 *YEAR BOOK*, pp. 54-55) became worse as a result of a Labor victory over the United Australia party's candidate in the by-election of Mar. 3, 1940, to fill the Corio seat vacated by R. G. Casey, Minister to the United States. Labor party spokesmen during the campaign opposed the dispatch of further infantry divisions overseas or conscription for service either at home or abroad, while pledging full support of the Allied cause. Local issues also played an important part in the election.

**Coalition Government Formed.** Following similar Labor gains during 1939, the outcome in-

duced the United Australia party under Prime Minister Menzies and the Country party led by A. G. Cameron to sink their differences and form a coalition government (March 14). The new cabinet, consisting of three Country party and nine United Australia party members, consisted of: Prime Minister, Defense Co-ordination, Information, Robert G. Menzies; Commerce and Navy, A. G. Cameron; Attorney-General, Industry, W. M. Hughes; Army and Repatriation, G. A. Street; Vice-President of the Executive Council, Sir Henry Gullett; Supply and Development, Social Services, Sir Frederick Stewart; Postmaster-General, Health, H. V. C. Thorby; Treasurer, P. C. Spender; Trade and Customs, Sen. G. McLeay; External Affairs, J. McEwen; Interior, Sen. H. S. Foll; Air, Civil Aviation, J. V. Fairbairn

Further Labor gains were recorded in the State election held in Victoria on March 17. The composition of the new State Legislative Assembly was: Labor, 23; United Country party, 22; United Australia party, 15. Independents, 5. Premier A. A. Dunstan (Country party) continued in office with the support of Labor.

**Labor and the War.** The strength of Communist and other extreme radical sentiment in the New South Wales section of the Labor party was indicated by a resolution adopted March 24 opposing Australian participation in any overseas war or extension of the European conflict into a war against Soviet Russia. This was voted by the State Labor Conference, 195 to 88, against the protests of State Labor leaders, after radical speakers had attributed the European war to "British imperialistic capitalists." This viewpoint was repudiated by the leaders of both the State and Federal Labor parties. However, John Curtin, leader of the Federal Labor party, in a radio broadcast on April 8 proposed that Germany and Russia withdraw their armed forces from occupied territories of Poland and Finland and join in a peace conference "based on a renunciation of war and hatred."

Early the next morning the Germans invaded Denmark and Norway. This and the subsequent great German victory on the Western Front had profound repercussions within the Australian Labor movement and the country as a whole. At the opening session of the Federal Parliament on April 17 the government announced its decision to censor Communist publications and prosecute persons charged with subversive activities designed to defeat the country's war effort. On April 19 a split occurred in the New South Wales Labor party. A minority faction led by former State Premier J. T. Lang seceded because of the alleged failure of the Federal executive committee to oust Communists from the party ranks.

As the German drive on the Western Front gained momentum, Prime Minister Menzies on June 7 established a new Ministry of Munitions with himself as Minister and appointed Keith Murdoch, managing director of *The Melbourne Herald*, as Director General of Information. Italy's entrance into the European conflict was followed immediately by the internment of all Italian nationals who were active Fascists or military reservists. At 9 a.m. on June 11 the government announced that a state of war existed between Italy and Australia. Italians formed the Commonwealth's largest group of aliens. Troops and police were concentrated in northern Queensland, where

some 7000 Italians had settled, but there were no disorders.

**Emergency Parliamentary Session.** On June 16 Prime Minister Menzies, declaring Australia must mobilize all her resources of manpower and materials, called a special session of Parliament for June 20. New regulations issued under the National Security Act dissolved the Communist party, the Australian League for Peace and Democracy and seven Fascist organizations. Police raids were made on Communist headquarters in various cities and on homes of party members. On June 19 a special conference of the Australian Labor party junked long-cherished planks of the party platform. It not only approved compulsory military training but also advocated reinforcement of Australian divisions previously sent abroad and full participation in the Empire air training scheme. It proclaimed Australia's indissoluble unity with the Allies, urged that the nation's entire resources be controlled and mobilized for war by the government on a planned basis aiming at maximum use, and called for a 100 per cent war profits tax.

When Parliament assembled the next day, an amendment to the National Security Act authorizing the government to conscript all persons, their services and properties whenever needed in the nation's war effort was passed by the House of Representatives 61 to 9 and by the Senate 27 to 3. In accordance with the Prime Minister's long-standing pledge, compulsory military service was restricted to Australia and its territories. He warned the country that the government would raise the largest military force it was able to equip, impose taxes to the limit of capacity, control prices, punish profiteers, and ask all classes to share the war burden equally.

**The General Election.** While the government proceeded energetically to develop Australia's war strength, it was handicapped by the lack of a solid party backing in Parliament. The Labor party refused Prime Minister Menzies repeated invitations to enter a national all-party coalition for the duration of the war. It likewise opposed his proposal that the life of the existing Parliament be extended to avoid the scheduled fall election, in which one-half of the House and one-third of the Senate were to be replaced. In the latter stand, Labor was supported by Minister of the Navy Cameron, leader of the Country party.

On August 13 a military plane carrying leading cabinet and military officials from Melbourne to Canberra for a cabinet meeting crashed, killing Army Minister Street, Air Minister Fairbairn, Vice-President of the Executive Council Sir Henry Gullett, Lieut. Gen. Sir Brudenell White, Chief of the Australian General Staff; Mr. Fairbairn's secretary, and four members of the crew. Sen. Philip McBride and Rep. Arthur Fadden were appointed acting Defense and Air Ministers, respectively.

The tragic air accident forced the Prime Minister's hand and on August 21 he dissolved Parliament and called a general election for September 21. On the same day the Country party agreed to form a united front with the United Australia party. The coalition fought the electoral battle on a platform calling for the subordination of all issues to the prosecution of war and the continuation of efforts to include the Labor party in a national government. The platform of the Opposition Labor party, as stated by John Curtin, called for inflexible support of the British cause, sub-

ordination of profit-making and self-interest to national security, increased pay for the militia and Australian Imperial (overseas) Force, reorganization of the Department of Information and other Menzies-appointed commissions, increased old-age and invalid pensions, pensions for widows and orphans, and allowances to families having more than two children under the age of 16.

Two minority Labor factions, however, rejected Curtin's leadership. The so-called non-Communist group, with 5 Representatives and 2 Senators, was primarily interested in restoring J. T. Lang to leadership of the party in New South Wales, from which he was ousted in 1939. The third faction, comprising extremist adherents of the New South Wales "anti-war" bloc and controlling the Labor party's executive committee in that State, opposed the emergency powers conferred on the government by Parliament on June 20.

As a result of the election, Labor gained 4 seats in the House of Representatives, giving it 36 seats to 38 seats held by the government coalition (United Australia party, 24; Country party, 14). In the Senate, Labor gained 1 seat. It held 17 out of 36 seats in the new Senate, due to take office in July, 1941. The Labor gains made the government's parliamentary position weaker than before. A Labor government was equally impractical, since the Lang faction, with four members in the House, insisted upon remaining a separate party and demanded a high price for its co-operation with Curtin's majority group. As a result of conferences among all political parties, it was decided on October 22 that the Menzies Government would continue in office. Labor again refused to participate in either a national government or national executive war council. But it agreed to the establishment of an advisory national war council composed of 4 members of the cabinet, 3 Laborites and 1 Langite. Besides Curtin, the Labor appointees to the new council were F. M. Ford, deputy leader, and N. J. Makin, secretary of the party. H. J. Beasley represented the Lang Labor faction.

**Cabinet Reorganized.** Prime Minister Menzies on October 27 reshuffled his cabinet as follows: Treasurer, Arthur W. Fadden; Attorney-General and Minister for the Navy, William M. Hughes; Army, Percy C. Spender; Postmaster-General, Repatriation and Vice-President of the Executive Council, Sen. George McLeay; Air and Civil Aviation, John McEwen; Interior, Sen. H. S. Foll; Commerce, Sir Earle Page, who had replaced A. G. Cameron as leader of the Country party; External Affairs, Social Services and Health, Sir Frederick Stewart; Supply, Development and Munitions, Sen. Phillip A. McBride; Customs, Eric John Harrison; Labor and National Service, Harold E. Holt. Messrs. Hughes, Fadden, Spender, McEwen, and Foll were named members of the Prime Minister's new War Cabinet. Parliament reconvened on November 20 to consider the budget for the next fiscal year.

**War Contribution.** The first division of the volunteer Australian Imperial Force, raised in 1939, arrived in Egypt along with a smaller contingent from New Zealand on February 12. Other large contingents landed in Egypt on May 17 and in Britain about June 20. The first Australian contingents reaching the Near East were quartered in Palestine, but with the Italian invasion of Egypt toward the end of the summer these divisions and new infantry, air, and artillery units from Australia were concentrated for the most

part on the Egyptian front, where they participated in the December offensive. Other Australian air force and military units were stationed at Singapore.

Meanwhile the training program in Australia was steadily expanded and speeded up. In April, Royal Air Force officers and men began to arrive in Australia to assist in training airmen under the Empire air scheme. At the end of May enlistment of another overseas division began, while the militia force was rapidly expanding. In June, World War veterans of the Returned Soldiers League were authorized to organize an official army reserve for home defense. On July 17 the government announced plans to increase armed forces in Australia to 300,000 by the end of March, 1941, including a home defense force of 210,000 conscripts and volunteers and 90,000 troops training for overseas service.

By the end of September, Australia had sent about 23,000 soldiers, sailors, and airmen overseas and 100,000 more volunteers for overseas service were in training. By December approximately one out of every six males in the country were in uniform. The unit strength of the A.I.F. was already equal to that of 1914-18. Major attention was being concentrated upon the air force. The Empire air scheme called for an Australian air personnel of 16,000 and a ground staff of 26,000 by March, 1943. By mid-September, 1940, 9476 airmen and 18,144 members of ground crews were enlisted, and a large proportion of them were in training in 14 training schools. Seven more schools were due to open before the end of the year.

To provide planes for training purposes, the government stepped up local production of aircraft factories and placed large orders in Britain and the United States. By the end of August production of Australian factories averaged 600 planes a year. Australian shipyards were busy with orders for destroyers, sloops, and other smaller war vessels for the British navy. The domestic munitions industry was rapidly expanded with the aim of making the Commonwealth independent of overseas arms factories. Tanks and anti-aircraft guns were produced as well as rifles, small arms and other essential munitions and equipment. About 450,000 men were engaged in war industries of one kind or another.

**War Financing.** The cost of this program was indicated by Prime Minister Menzies on July 24 when he said that Australia had already undertaken a defense expenditure of £453,000,000 over three years. This was equal to the Commonwealth's total expenditure on the World War. War expenditures rose from £6,900,000 for July, 1940, to £11,000,000 for October. All forms of taxation were heavily increased, but loans were resorted to to meet the major share of the war's cost. A series of successful internal war loans were issued during 1940 and the British Government advanced a loan to meet Australia's overseas expenditures for war purposes up to the end of December. Also see above under *Finance*.

**Control Measures.** The government ran into serious difficulties in its efforts to speed up war production, reduce dependence upon overseas sources of supply, and curb subversive and other obstructive influences. A government measure granting Australian Consolidated Industries a monopoly for the manufacture of automobiles in Australia was modified by Parliament and adverse public opinion. The monopoly feature was elimi-

nated from the law passed May 31, 1940, advancing government aid in the establishment of an automobile factory. Gasoline rationing, imposed to curtail the drain on dollar exchange, proved highly unpopular. Some measure of relief was provided beginning August 26 when the Commonwealth's first gasoline producing plant commenced operation at oil shale deposits in New South Wales. Output was about 10,000,000 gallons annually, and it was planned to triple this.

The co-operation of 38 Federal trade unions in maintaining and increasing wartime industrial production was obtained on July 5. They agreed to Prime Minister Menzies' proposal that trade union panels be established to advise the government and to serve as a link between it and the unions controlling workers in war industries. Regulations were issued barring specified craftsmen from changing jobs except with the consent of the employer and the munitions authorities. The labor-government accord followed the settlement in May of the coal strike against an award of the Commonwealth Arbitration Court. The government had threatened to open the mines with volunteers unless a settlement was reached, and had brought pressure upon the unions to oust Communist and other subversive officials who had played a prominent part in calling and conducting the strike.

With the approval of the Advisory War Council, the government on December 21 assumed power to deal with intrastate as well as interstate industrial disputes for the duration of the war. The jurisdiction of the Commonwealth Arbitration Court was thus extended to all industrial labor controversies, and the Constitutional restriction confining the Commonwealth's conciliation and arbitration powers to interstate disputes was temporarily set aside. The Commonwealth Government on December 7 also assumed control of coastal shipping and a system of priorities for cargoes was established. A long-range government program for stabilizing the wheat industry by guaranteeing a price of 3 shillings 6 pence a bu on production not exceeding 140,000,000 bu annually was announced November 9. The Commonwealth at the same time agreed to advance £A2,770,000 to the States for drought relief.

**Censorship Controversy.** A storm of protest arose when the Prime Minister on July 18 authorized the new Director General of Information, Sir Keith Murdoch, to compel any newspaper, broadcasting station, or film organization to disseminate any matter designed to assure effective prosecution of the war in the form prescribed by the Information Ministry. The vigorous opposition of both the press and public forced the government on September 2 to modify these regulations. The director general retained power to compel newspapers to correct inaccurate statements concerning prosecution of the war in prescribed form, giving them the same prominence as the original statements. The time that might be requisitioned from a broadcasting station was limited to 30 minutes in each 12 hours, and from a moving picture organization to 10 minutes in each program. The Communist press was suppressed on May 24 and the distribution of Communist propaganda was declared illegal.

**Empire and Foreign Relations.** British setbacks in Europe and the spread of the war both in the Near and Far East revealed more clearly than before the extent of Australia's dependence upon the protection of the British fleet and strength-

ened its loyalty to the mother country. At the same time Australia's growing military contribution to Empire defense promoted a demand for greater participation in the direction of Empire affairs. The Australian press joined in the demand for Prime Minister Chamberlain's resignation after the Allied defeat in Norway and the German invasion of the Low Countries. In June and July representatives of the New Zealand Government visited Australia and the two Dominions undertook to co-ordinate their war efforts and defense preparations in the industrial, military, and naval spheres. Toward the end of September, the Australian press and some political leaders began to urge the creation of an empire war cabinet on which the Dominions would be directly represented. An Australian delegation participated in the Delhi Conference of the Middle and Far Eastern units of the British Empire, beginning October 26 (see INDIA under *History*).

Japan's southward expansion caused rising alarm in Australia and was largely responsible for the shift in emphasis from the overseas to the home defense forces that became evident in mid-July. On May 20 the Minister of External Affairs and the Japanese Consul General exchanged assurances at Canberra that neither government would take action affecting the status quo in the Netherlands East Indies. In July the mandated territory of New Guinea and Papua were included in the new defense setup; their defenses were strengthened and white residents subjected to compulsory military service. On August 18 the Prime Minister named Sir John G. Latham, chief justice of the Commonwealth High Court, as the first Minister to Japan.

This appointment was not cancelled as a result of Japan's adherence to the Rome-Berlin alliance. But the Australian Government and press placed growing emphasis upon the necessity for diplomatic, military, and economic co-operation with the United States in Pacific affairs. On March 5 Richard G. Casey presented his letters of credence as the first Australian Minister to the United States and on July 17 Clarence E. Gauss, the first American Minister to Australia, took up his duties at Canberra. An Australian-American conciliation treaty was signed Sept. 6, 1940. It was reported from London on November 7 that Australia, Britain, and the United States had agreed in principle upon the joint use of bases and other defense co-operation in the Pacific.

Prime Minister Menzies announced on December 27 that a sea raider, apparently a German vessel flying Japanese colors, had shelled and severely damaged buildings and docks of the settlement on the mandated island of Nauru.

See BRITISH MALAYA, GREAT BRITAIN, NEW ZEALAND, and PALESTINE under *History*; BIRTH CONTROL; BRIDGES; EUROPEAN WAR; INDUSTRIAL CHEMISTRY; LABOR CONDITIONS; NAVAL PROGRESS. **AUSTRALIAN ANTARCTIC TERRITORY.** See AUSTRALIA.

**AUSTRALIAN CAPITAL TERRITORY.** See AUSTRALIA under *Area and Population*.

**AUSTRIA.** A former independent state of central Europe, annexed by Germany on Mar 13, 1938, and transformed into an administrative division of the Third Reich. Capital, Vienna. Area, 32,369 square miles; population, 7,009,014 (1939). Population of Vienna (1939 census), 1,918,462; Graz (1934), 152,841; Linz (1934), 108,970.

Roman Catholics comprised 90.57 per cent of

the population at the 1934 census; Protestants, 4.38 per cent; Jews, 2.83 per cent (191,481). The 1939 census showed 94,270 racial Jews. There were 4721 public schools with 657,000 pupils in 1940. Agriculture, manufacturing, mining, and lumbering are the main occupations. Formerly a favorite haunt of tourists, Austria has suffered since 1938 through the virtual exclusion of non-German tourists. In 1939 there were 3685 miles of railway line and 42,120 miles of automobile roads.

**Government.** Upon the annexation of Austria, Chancellor Hitler appointed Josef Buerckel as Procurator for the Liquidation of Austria and Reich Commissar for the Reunion of Austria with Germany. Austria was subdivided into seven districts (Gaus), each under a National Socialist responsible to Herr Buerckel in Vienna, who in turn was directly responsible to Chancellor Hitler. Effective Apr. 1, 1940, this system was reorganized. The Nazi leader in each district was given the title Gauleiter (district leader) and Procurator, combining party and state functions, and became directly responsible to Hitler. Herr Buerckel's powers were restricted to those of Gauleiter and Procurator for Vienna. On August 7 Buerckel was transferred to the post of Civil Administrator of Lorraine and was succeeded in Vienna by Baldur von Schirach, former head of the Hitler Youth.

**History.** During the first quarter of 1940 Austrian political exiles made considerable progress in uniting their forces and in securing Allied backing for the restoration of Austria as an independent state. In response to the efforts of Archduke Otto of Hapsburg, pretender to the thrones of Austria and Hungary, and other Austrian exiles the French government and press declared the restoration of Austrian independence to be one of France's war aims. The British Government made no formal commitment, but the British Labor party on February 8 called for a postwar plebiscite to determine Austria's future. The Liberal party took a somewhat similar stand. On March 11 an Austria Office was opened in London to unite Austrian Social Democrats and Monarchists in the struggle against Nazi domination. The exiles declared that reports from Austria indicated growing discontent with German rule. During March and April Archduke Otto visited the United States to seek support for his cause.

This campaign for Austrian independence received a major setback when the German armies overran the Low Countries and forced France to capitulate. Archduke Otto, his mother, the former Empress Zita, and the other members of her family were at Castle Steenockerzeel near Brussels when the German *blitzkrieg* against the Low Countries was launched on May 10. They fled by automobile after German bombing planes had attacked the castle for six hours, and on June 22 succeeded in reaching Lisbon, whence they traveled by air to the United States. Archduke Otto reported that while in Bordeaux preceding the German occupation, he obtained French collaboration in helping 1000 of the 25,000 Austrian refugees in France to escape into Spain and Portugal. The remainder were obliged to remain.

During this period the controlled press in Austria was reported to have assured the public that the war would be over in three weeks and that a golden age would ensue for all Germans. Toward the end of October patriotic rallies were held in Vienna and other Austrian cities for one week,

with Propaganda Minister Goebbels as the chief speaker. He assured the Austrian people once more that Britain would soon collapse.

At the same time German sources reported that Vienna was regaining "its historic position as chief middleman between the industrial countries of Western and Central Europe and the agrarian countries of the Southeastern Continent." The Vienna Fall Fair attracted 300,000 visitors and most of the non-belligerent European countries participated. In May delegations from Bulgaria, Greece, Hungary, Rumania, and Slovakia met with a German delegation in Vienna for a conference designed to emphasize Vienna's role in the "new order" that Germany was establishing in Southeastern Europe. In line with this program, the Berlin-Munich-Salzburg superhighway was extended to Vienna during 1940 and work was begun on another similar project linking Vienna with Danzig by a direct north-and-south route touching Breslau and Poznan in conquered Poland.

In June it was announced that the birth rate in Vienna had risen so rapidly that hospitals and sanitariums were unable to accommodate all the expectant mothers. The Austrian population was further increased by the influx of some 80,000 German-speaking inhabitants of the Italian South Tirol, transferred under the German-Italian accord of Oct. 21, 1939 (see 1939 YEAR BOOK, p. 388). They were resettled in the Vorarlberg district on the Austrian side of the border.

German accounts of contentment and plenty in Austria under Nazi rule were denied by Austrian workmen who escaped to Yugoslavia and Turkey late in the year. They declared that Austria was on short rations and that unrest was widespread among the civil population. Anti-Nazi demonstrations by factory workers, housewives, and others were reported. Two hundred workmen were said to have been arrested following anti-German demonstrations in Vienna on November 17.

See GERMANY; JEWS.

**AUTOMOBILE RACING.** Motorcar competitions proved something of a disappointment throughout the past year. Wilbur Shaw won the 500-mile Indianapolis classic on Decoration Day, but under circumstances bereft of that excitement that lures the racing fans to stadiums. After vying for the lead with Rex Mays and Mauri Rose for 375 miles, a sudden visitation of rain compelled all competitors to refrain from passing one another—in accordance with an official regulation that sometimes makes a race into a mere parade. So for 125 miles Shaw handled his car with all the methodical élan of a Sunday driver heading for the country. Before the rain dropped, Shaw had set new records for 300 and 350 miles, averaging almost 119 miles an hour. For the entire route he averaged 114.277 m.p.h.

A new record for a one-lap mile was chalked at the Wisconsin State Fair when Mays covered the course in 95.29.

**AUTOMOBILES.** National defense was the topic of the year, the automobile industry being destined to perform a key role. Its plants were potentially most capable to take on the manufacture of parts for airplanes, tanks, and other combat equipment. Recognition of that was the early selection of one of the industry's outstanding personalities, William S. Knudsen, president of General Motors, to administer the production phase of the United States "defense program." More-

over, some felt, car and truck factories could most safely curtail normal-time output since, through the years, they had established for the country a vast fleet of vehicles and stimulated road building, giving this country that other vital element to defense, an adequate highway transportation system, one indeed unapproached by any other nation. In time of national emergency, by drafting civilian equipment to augment the military, there would be every facility for rapidly moving troops and supplies.

Naturally a leading subject of conjecture was what effect defense work would have on automobile business. Would more or less of its volume have to be sacrificed on the altar of patriotic duty? Would further improvement of existing models have to be postponed until the national emergency were over? Whatever may yet eventuate, so far, from the record of 1940, the answer to both questions was in the negative.

As to volume, automobile production came close to the predicted 4,500,000 vehicles, being now estimated at 4,476,000 or 25 per cent above 1939. That it was not higher was not because car factories were engaged in defense work. All such orders for equipment or parts placed with them were handled either in new plant extensions or in spare capacity of existing plants as a rule, so automobile production suffered no overall curtailment, and throughout the past year there was no shortage in supply of new cars. The market might well have outreached anticipated proportions, but for laggard general economic improvement and such unsettlement of buying activity as usually exists in the year of a presidential election. To the close of 1940 there had not been time for much stimulus to be felt in general business as a consequence of such increase in employment as came from war and defense orders. The last quarter did show a decided uptrend, however, and, anticipating greater spending power, the factories generally increased their schedules for the 1941 models; the most conservative predict a four-million production. They contend that it is vital to our defense to guard our economic front and, as general business follows the automobile business, the more cars sold the better. It will keep dealers in business whose service facilities are important to maintain all equipment now in use.

As for improvement of products, plans and preparations for the new models, including any necessary retooling, were already past danger of interference from taking on war orders. So complete was their redesigning, however, as to suggest intent to do all possible while possible, lest the machine-tool builders be too tied up to supply equipment for much change in the 1942 models. Anyhow, changes, both in appearance and mechanically were more decided than in the 1940 models. Riding ease, by contrast with what it once was, seemed almost ideal, nevertheless designers still found refinements possible in weight distribution, balance, springing, and shock absorption. All makes were improved in comfort, safety, convenience, and economy of performance. Most striking was an almost extravagant striving at ornateness, particularly in front-end treatment, with lavish use of chromium, flowing over on some to hood and body-side moldings, to embellish, perchance, the simplified body contours now universally stream-lined. Characteristic were more massive bumpers, a contribution perhaps to looks, but certainly to strength. In parking, especially, it has be-

come habit to maneuver to contact in either direction; now danger of damage to car or bumpers and risk of locking bumpers are diminished. Two-tone painting, optional on nearly all, with two-tone interior trim to harmonize, featured the styling—an obvious appeal to feminine tastes. All were longer and wider, and door widths were increased. A general effect of greater roominess, with more ample leg and elbow room applies also to headroom, in spite of a tendency to lower overall height. On the average, cars had 2 to 4 inches longer wheelbase, were 3 to 5 inches wider and 5 to 9 inches longer overall. Still larger luggage compartments with better disposition of the spare tire and lids counterbalanced to obviate chance of falling unintentionally, were featured. Body lines were cleaner, not only enhancing beauty, but facilitating washing and polishing. Few crevices, prone to catch and hold dirt, remained. Valleys between the hood and fenders entirely disappeared and there was more tendency to sweeping rear lines, effacing the bustle effect of the luggage compartment. All headlamps were blended either into the noses or tops of the front fenders. There located they are farther apart and nearer the ground, both favorable, some feel, to better lighting of the road. Tail lamps became similarly established in the rear fenders still earlier. Running-boards had threatened to become a tradition, but concealed running-boards, covered by flares at the bottom of doors and body, appeared on many lines as a compromise for those who object to their complete elimination. Besides an enhanced appearance, there is immunity from accumulations of mud, snow, and ice that make footing treacherous.

Horsepowers of engines were raised throughout, principally from increased compression ratios, the average of which is now 6.6 to one, but also from better carburetion. Only three lines had any increase in cylinder dimensions. Hoods locked from a knob within the car under the dash were the new order, especially needful since batteries took their place under the hood, to reduce exposure to theft. With the car locked the hood cannot be raised without forcing. Coupes are growing more and more like two-door sedans, which, to a great extent, they are replacing. Since most coupes acquired a single full-width rear seat, their principal differences are somewhat less leg room in the rear compartment and slightly shorter rear quarter windows.

Transmissions have been the most backward element in the automobile's evolution. Latterly factories have turned their research in that direction with a variety of results and a new crop of trade names. The only thing they had in common was the purpose of simplifying driving by reducing hand and foot work in speed changing. The fluid coupling was a part of Oldsmobile's Hydramatic, Chrysler's Vacumatic, De Soto's Simplimatic, and Dodge's fluid drive. All Chrysler products except Plymouth had fluid coupling available as an optional extra. On Chrysler and De Soto it might be had in combination with a four-speed semi-automatic transmission whose shifts between first and second and between third and fourth speeds are controlled by the accelerator pedal. In general the others were efforts to operate the clutch more or less automatically Packard had the Electromatic clutch; Hudson the Vacumotive clutch. None of these were standard equipment, but might be had at extra cost. Standard equipment in all cars was a three-speed gearshift controlled by a hand-lever

beneath the steering wheel, except in the Crosley. In many a lower ratio second-gear speed was provided for quicker getaway. Overdrives seemed to be returning to favor, being provided on many models. Usually these were at least semi-automatic in their going into and out of action. Finger-tip gear-shifting, so called, had actual shifting movement performed by a vacuum cylinder connected with the engine suction. Remembered as a part of the Hudson Electric Hand, it was first mechanically controlled on the 1940 Chevrolet. For 1941, Chevrolet, Hudson, Chrysler, De Soto, Dodge, Plymouth, Packard, and Lincoln had it as standard or optional equipment. It reduces the effort of gear shifting and shortens the movement of the gear-shift lever.

Among other features, not new but more widely used, were independent front suspensions, power operation for the tops of convertible cars (provided in even the lowest-priced), steering wheels with no spoke in the upper half for better view of the instrument panel, air-foam rubber seat cushions, direction indicators, concealed gasoline filler caps, oil-bath air cleaners, checks to hold doors fully open so that they do not swing or blow shut unexpectedly, and single-piece heat-treated curved rear windows—a part of the increasing effort to achieve better visibility. The Packard 180 and the Lincoln Custom line had an innovation in window controls. Through an electric motor, hydraulic lifts raise or lower the windows selectively when conveniently located switches are moved up or down, doing away with manual manipulation. Packard full-mechanical refrigeration cooling system, introduced the previous year, was continued as an optional extra. Cars of all Chrysler makes featured a new safety rim that prevents a flat tire from being thrown off.

No new manufacturers came into the passenger car field and no old ones passed out. There were some new chassis and some were dropped. In the Willys case, it carried a new name—Americar—and replaced the Overland. Cadillac discontinued its 16-cylinder line (all of its new models are V-8's) and the La Salle, but replaced the latter's two models with two lower-priced Cadillacs. Nash added a new model in the price range of greatest demand, as had Hudson and Studebaker earlier. It had the distinction of being the only car in its class having coil springs rear as well as front. A new line for Ford was a four-cylinder truck.

Exports of motor vehicles suffered drastically because of the European and Asiatic wars. Latin American business increased some, but not enough to offset other losses, so that exports as a whole fell off 26 per cent. In the interest of national defense, as well as in its own selfish interest, the automobile industry is concerned about western hemisphere solidarity. With all other countries that produce automobiles practically out of the market, South American business all came to this country, but as most of it always had, the increase was not significant.

In 1940 the longest continuous increase in car sales was recorded—23 months—and service-maintenance volume reached an all-time peak. The first nation-wide plan for selling automobile repairs on the installment basis was announced and slowly got under way with jobber sponsorship. Jobbers continued to open additional machine shops and to improve methods and equipment, especially for complete engine rebuilding. These shops would be a factor in national defense by their widely scat-

tered facilities for keeping motor transportation in operating condition.

New models were all out before the National Automobile Show (October 12 to 20), but in spite of that, it was especially well attended. Two factors that contributed were Ford's exhibiting there for the first time and the introduction of a new feature—the Historic Car Exhibit, where nearly 40 old timers were shown, one dating as far back as 1897 and all holding interest either because of age, or having distinguished themselves in notable races or other events, or having once belonged to or transported notable personages.

**Statistics.** The before mentioned 25 per cent production increase was released by the Automobile Manufacturers Association when the year closed. Still partly estimated, the factories' combined passenger-car sales from United States and Canadian plants were 3,705,000 and motor truck sales 771,000. The former had a wholesale value of \$2,413,800,000 and the latter \$598,300,000. These figures, added to the estimated wholesale value of parts, accessories, and tires sold to present owners, and service equipment—\$1,250,000,000—made the grand total of factory business \$4,262,100,000.

The latest available figures for foreign production, exportation, and importation of motor vehicles are for the year 1939 which, as published in *Automotive World News*, June 20, 1940, by the Department of Commerce, showed that in that year 21.9 per cent of the world total of 4,779,170 were produced outside of the United States and Canada, as compared with 33.6 per cent in 1938. Such was the effect of wars and conquests on so many foreign vehicle-producing countries in 1939, and it was certainly greater in 1940. In 1939 non-American production of cars amounted to 685,710 passenger cars and 360,742 trucks and buses. In 1940 it was assuredly far less, even allowing for production of such vehicles for military use, so it is probable that the world total of vehicles was not over 5,250,000. Foreign vehicle-producing countries in 1939 exported 190,919 units (18.2 per cent of their production), and the same countries imported 115,679. The United States and Canada exported 8.3 per cent of their production, 311,034 vehicles (sales within Canada not included), and imported 18,585.

For 1940 United States and Canadian vehicle exports dropped to 230,500 units and accounted for only 5.1 per cent of production, a showing made poorer by the increased domestic sales. The combined value of motor vehicles, parts, and tires exported totaled \$280,000,000, a decrease from the year before of 13 per cent.

A new high for number of vehicles in use was established. Domestic registration reached 31,950,000 for a 4.3 per cent increase, and gave the United States 69 per cent of the estimated world registration of 47,000,000. The figure for this country is not final, but represents 27,300,000 passenger cars and 4,650,000 trucks. Of the new vehicles sold here last year about 84 per cent replaced others that were scrapped.

The jump in employment must be partly attributed to defense work. Workers in automobile, body, and parts factories increased 14 per cent to 443,000 and the weekly payroll 26 per cent to \$15,400,000.

Motor vehicle user taxes continued at the same ratio of total Federal, State, and local taxes, 11 per cent, but the revenue collected from them—\$1,772,000,000—was 8.7 per cent greater than the year before, double the percentage of increased vehicles

in use. With nearly the same disparity, gasoline taxes, representing two-thirds of what is paid to the various governmental divisions by users of the highways, climbed 8.2 per cent to \$1,120,000,000.

The only current measure of motor vehicle retail business is the number of establishments, for sales volumes as reported to the Census of Business are long deferred in the process of collecting, compiling, and distributing. That source is the authority for a recent statement that "the number of auto service stations increased less than one-third the rate of the preceding five years in the period since 1935, while sales in the latest five years more than doubled the preceding period." The following, from Chilton Company figures, shows the past year's increase in number of establishments:

Type of establishment	1939	1940
Total car and truck dealers	40,599	41,494
Total repairshops	86,709	87,366
Total retail outlets, duplicates eliminated	94,494	94,985
Wholesalers	6,176	6,264
Retail gasoline outlets	400,000	400,000

Retail sales of motor vehicles in the United States were 27.1 per cent higher than for 1939.

**Motor Transportation.** In "Public Aids to Transportation," (vol. iv) issued during the year by the Federal Co-ordinator of Transportation, the estimated distribution of motor traffic in 1937 was comprehensively studied. It showed a total annual mileage of 265,000,000,000, broken down as: 215,935,100,000 for passenger cars including taxicabs, 46,695,700,000 for motor trucks, and 2,369,200,000 for motor buses including school buses. Translated into probable 1940 traffic, stepping each item up in the ratio of the intervening registration increases, the estimated mileages were: total annual passenger car, 231,640,500,000; motor truck, 51,405,800,000; motor bus, 2,612,300,000, making a grand total motor vehicle mileage of 285,658,600,000. In 1940 more than 90 per cent of all passenger mileage was traveled by motor vehicle—490,000,000,000 passenger miles.

According to data obtained from highway planning surveys made by the U.S. Public Roads Administration, 55 per cent of the total mileage of passenger cars is connected with business activities. From the same source was the estimate that 56.5 per cent of motor-vehicle travel was over primary rural highways and trans-city connections, 13.4 per cent over secondary highways and local rural roads, and 30.1 per cent over city streets.

More than 48,000 communities, with a total population of nearly 8,000,000, not reached by railroads, were dependent upon motor vehicles for their personal transportation and the handling of goods and supplies into and out of them. Most of these never had street railways and those that once had, have almost entirely replaced them with buses. Rail transportation by surface lines, subways, and elevated railways became still more restricted to the larger cities and some of them abandoned surface cars in favor of trolley buses or gasoline-driven buses. Growing use of trolley buses has been a noticeable trend of recent years, dictated largely by desire to secure the greater flexibility of buses without scrapping or liquidating power plants. Not being confined to rails, they contribute materially to fluidity of traffic.

The United States had more motor trucks in use than all other countries combined. One of every four was owned by a farmer. Conspicuous among

the advantages of trucks is their more rapid handling of perishable goods. Large percentages of farm products went to market exclusively by trucks—27 per cent of the butter, 39 of eggs, 65 of live poultry, 40 of fruit and vegetables, 62 of cattle, 61 of calves, 68 of hogs, 29 of sheep and lambs, and 50 of horses and mules. Twenty-four cities received all of their milk by truck. About 9 per cent of the coal production was shipped from the mines by truck.

Motor transportation has played a conspicuous part in speeding the delivery of mail, especially in rural districts. The latest figure on the mileage of rural highways used by the U.S. Post Office Department was 1,392,657, in its operation on 32,839 rural routes using 15,045 motor trucks in all branches of its service. About half of the motor vehicles built were transported from their factories to dealers over the highway by truckaways or driveaways, notwithstanding which about 14 per cent of railroad freight was automotive. Railroads themselves had in use more than 66,000 trucks for terminal transfer, intercity and store-door delivery service. As of March, 1939, there were 25,058 owners of truck fleets of eight or more, operating a total of 954,302 trucks. The Bell Telephone system was the largest single owner, having 16,210 trucks and 4490 passenger cars. An incomplete list showed 127 companies each operating a hundred or more vehicles.

The owners of the 4,650,000 motor trucks registered by the end of the year paid in special taxes for the privilege of operating them, \$460,000,000. Per dollar of gross revenue from operating for-hire trucks, an average of 68 cents was paid in taxes. Privately owned and operated trucks made up 86 per cent of the total. Truck and bus operation made its contribution to employment by requiring 3,900,000 drivers.

Motor buses in use increased to 141,300. Of these 54,000 were revenue buses (city 33,550, intercity 18,000, sight-seeing and charter hire 2450) and 87,300 non-revenue buses (school 86,300, hotel 300, industrial 500, and miscellaneous 200). Motor carriers operated 30,525, electric railways 19,250, and steam railroads 1775. Those buses that were exclusively or partially in the service of schools (two out of three), carried last year a daily average of 3,968,000 scholars and the cost of the service was \$76,053,000, with 44,250 schools using buses.

Very important from the standpoint of better understanding among the 21 American republics was the increased travel among them as progress is made in the completion of the Pan-American Highway. During the year more headway was made in several sections, but figures of the total mileage had not been assembled. Since construction began in 1925 it has proceeded at a rate in excess of 600 miles per year. The highway begins at Nuevo Laredo, Mexico, extends for 3200 miles to the Panama Canal, proceeds another 6000 miles to Buenos Aires, Argentina. There it turns north an additional 1900 miles to Rio de Janeiro, Brazil. At the end of 1940 approximately two-thirds of the highway in South America was suitable for year-round travel, and much of it—2015 miles—was paved road. Eventually connecting all of the republics of the two continents, this highway will be of tremendous commercial importance not only in promoting travel between the countries, but also in extending trade between them, the highway furnishing the additional means of motor transport for their exchanges of goods.

**Automobile Accidents.** The overall trend in traffic accidents has been constantly downward since 1934 when the fatality rate was 18.4 per 100,000 vehicle miles. "Accident Facts," published during the year by the National Safety Council, showed that the traffic fatality rate on a mileage basis reached a new low in 1939, 12.1 per 100,000 vehicle miles, 30 per cent below what it was in 1929. There was a 10 per cent decrease in accident rates by the operators of motor vehicle fleets. Private intercity trucking was the classification that had the largest reduction, 28 per cent.

The 1940 safety record was at least no worse. Although there were numerically more fatal accidents than in 1939 (latest estimate 34,500), accidents in relation to miles driven were the same, for there was a 6 per cent increase in mileage driven. That fatal automobile accidents were not greater was attributed to co-ordinated traffic control, traffic education, highway improvement, and better cars. The 1941 models have been adjudged at least 50 per cent safer than those of 1931. Factors contributing to reduced severity of accidents have been more use of steel in places that protect passengers, recessing or rounding of fitments that may cause injuries if a sudden stop throws car occupants against them, and especially the now universal use of safety glass throughout. Lower center of gravity as against the former top heaviness has increased stability and reduced the frequency of accidents.

An important part in the technique of traffic accident prevention is adequate accident reporting and its intelligent analysis, so that the indicated corrective measures may be applied to reduce recurrence. Twenty-seven States now have, through adoption or revision, accident report forms and methods that are substantially standard. There is much more, however, to the Standard Highway Safety Program for States advocated by the Automotive Safety Foundation, the seven elements of which include legislation, motor-vehicle administration, enforcement, engineering, education, training personnel, and research. To date not more than 20 States have as yet either a well co-ordinated official safety program, or an adequate State Safety council, or both, which gives some indication of how much room for improvement still exists.

Much of the gain in traffic safety may be ascribed to "Child Safety Education," which began in 1922. As a result the 5- to 14-year-old age group has led all other ages, year after year, in the reduction of traffic-death figures. From 1922 through 1938 the 5- to 14-year-old fatalities dropped from 14 to 11 per 100,000 persons, nearly 25 per cent, while the rate for every other age group rose, some 30 per cent, some over 100 per cent. More than 500,000 children are now enrolled in school safety patrols. The film, "Speaking of Safety," which has already been seen by 5,000,000 elementary school children during the past three years, was given additional distribution. Perhaps most important of all, the American Association of School Administrators adopted and incorporated in its 1940 *Yearbook*, a thorough-going safety program of education for schools.

Guidance of traffic by radio, which has been under experimental development for years, had its first work-out last summer with an installation of the Halstead system on the George Washington bridge from New York City to Englewood, N.J. So far it works only for east-bound traffic, direct-

ing motorists what to do on leaving the bridge to reach various objectives. A sign calls attention to the service and indicates the dial setting. Use of a low-power transmitter and wave-guide cable confines the broadcast to cars for which it is intended. It offers great possibilities in increasing safety as well as expediting traffic by transmitting messages that warn of dangerous driving conditions, or advise detours to avoid places where traffic is congested. It has obvious advantages over signs that may be missed, especially at night, and is elastic in its adaption to emergencies. Messages to be continuously repeated are recorded and reproduced so that an announcer is not kept on duty. For some time broadcasting stations have been giving spot announcements of highway conditions for the benefit of radio-equipped cars which have now reached a ratio of one to every four cars registered. These experiments portend a new technique in traffic control. See ACCIDENTS.

**Legislation.** Most State legislatures sit only alternate years and most of them in the odd-numbered years; only nine States held regular sessions. Apparently those that convened were more or less satisfied with what was already on their statute books so far as motor vehicles and use of their highways were concerned. New enactments were principally amendments of existing laws. Some adverse bills were presented but nearly all defeated and, in general, laws passed were not unkind to highway users, although not all of the hoped for legislation was secured.

The most unsatisfactory phase was that of diversion of motor taxes to other than highway purposes. New York was the worst offender, diverting three-fourths of its total special road imposts in the budget adopted—in excess of \$75,000,000. New Jersey somewhat increased diversions and South Carolina evaded a State supreme court nullification of a diversion law enough to divert \$2,000,000 for State government expenses. On the other side, Louisiana reduced diversion and North Dakota became the eighth State to make it, by amendment, constitutionally prohibitory. In other States similar efforts failed.

The tax situation, which had reached the point where one out of every nine tax dollars collected from all sources, Federal, State, and local, was paid by the motorist, at least was not aggravated. No States increased their gasoline tax rates, although three attempted it. Motor vehicle taxes of one form or another were reduced in Alabama, Louisiana, and Mississippi; some increased and some decreased in Virginia and peddlers were affected by changes in Kentucky, Mississippi, and Virginia.

Many States have found it conducive to more use of cars and hence yielding them more in gasoline taxes, if they defer registration renewals from the first of the year. Less than 10 per cent of United States motorists had to pay for their new tags on January 1. To date 30 States have modified their laws to postpone registration two or three months and 14 others give periods of grace up to 60 days.

Nothing new of moment was enacted in respect to carrier regulation. Size and weight restrictions were liberalized in Louisiana and Virginia. Bills to that end failed in Kentucky, and Rhode Island reduced the maximum permissible length of combinations of trucks and trailers. Slight gains were made in the extension of reciprocal privileges to non-residents in Alabama and California.

Safety received consideration in bills relating to equipment, inspections, etc., but few laws were significantly changed. New York, Rhode Island, and Virginia gave greater power to local authorities over speed limits.

State operation of toll highways is spreading. Pennsylvania authorized extending to Philadelphia, the superhighway opened during the year from Pittsburgh to Harrisburg. South Carolina created a Commerce Development Board with broad powers to build and operate toll highways, railroad, and motor carrier lines.

Efforts to increase business regulation generally failed. Maine repealed its certificate of title and used-car-dealer regulatory laws. Rhode Island passed measures regulating manufacturer-dealer relationships including the licensing of automobile dealers. That State also provided for regulating motor fuel retailing, as did Alabama also.

Consumer groups, farmers, and governmental agencies joined in vigorous opposition to laws that interfere with free trade among States and no new barriers, such as port-of-entry laws, were created. Among the organizations on record against such barriers are: National Conference on Interstate Trade Barriers, Council of State Governments, American Association of State Highway Officials, Western Conference on Governmental Problems, American Association of Motor Vehicle Administrators, American Farm Bureau Federation, U S Departments of Agriculture and Commerce, Institute for Consumer Education, National Highway Users Conference, American Petroleum Association, and U S Public Roads Administration.

**AVIATION.** See AERONAUTICS and articles on various countries under *Transportation*

**AZERBAIDJAN SOVIET SOCIALIST REPUBLIC.** See UNION OF SOVIET SOCIALIST REPUBLICS under *Area and Population*.

**AZORES.** A group of nine islands (Corvo, Fayal, Flores, Graciosa, Pico, Santa Maria, São Jorge, São Miguel, Terceira), in the Atlantic Ocean, 800 miles west of Portugal of which it is, administratively, a part (3 districts). Area, 922 square miles; population (1930 census), 253,935. Chief towns: Ponta Delgada (capital), 18,022 inhabitants; Angra, 10,642; Horta, 7643. The principal products consist of oranges, pineapples, olives, grapes, and bananas. See PORTUGAL under *History*.

**BADEN.** See GERMANY under *Area and Population*

**BADMINTON.** The nation's No. 1 badminton player was David Freeman of Pasadena, Calif. He made a thorough sweep of the fourth annual national championships at Seattle in March, retaining the singles title he captured in 1939 and sharing in the victories of the men's and mixed doubles. His partner in the men's doubles was Chet Goss of Los Angeles, while Miss Sara Williams of Spokane paired with him in the mixed event. The women's singles title was won by Miss Evelyn Boldrick of San Diego, while the doubles victors were Miss Elizabeth Anselm of San Francisco and Miss Helen Zabriskie of Oakland.

At the Eastern championships in New York

City in February, Harold Seavey of Boston was victor in the men's singles, Jack Laimbeer and Julian H. Burgess of Garden City took the men's doubles, Miss Mary Hagan of Old Sixty-ninth the women's singles, Miss Helen Gibson and Mrs. Wanda Bergman of Westport the women's doubles and Mr. and Mrs. William Faversham of Boston the mixed doubles.

**BAHAMAS.** A British West Indian crown colony consisting of 20 inhabited and several uninhabited islands and rocks. Land area, 4404 square miles; population (1938 estimate), 67,726. Chief islands: Abaco, Acklins, Andros, Bimini, Cat Island, Crooked Island, Eleuthera, Exuma, Grand Bahama, Inagua, Long Island, Mayaguana, New Providence, Rum Cay, and San Salvador (or Watlings). Capital, Nassau (on New Providence). Education (1938): primary and secondary schools had 16,131 students enrolled.

**Production and Trade.** Sponge, shell (tortoise and conch), cascarilla bark, pine timber, salt, tomatoes, sisal, and crawfish are the chief products. Many tourists visit the colony every year. Trade (1938), excluding specie: imports £1,138,839 (34 per cent of this total was expended on food, drink, and tobacco); exports (including re-exports of £64,688) £213,135, of which sponge represented £90,054. In 1938 there were 1060 miles of highways.

**Government.** Finance (1939 estimates) revenue, £444,583; expenditure, £444,448; public debt, £253,000 on Dec. 31, 1938. Executive power rests with a governor, aided by an executive council. There is a legislative council of 9 nominated members and a house of assembly of 29 elected members. Governor and Commander-in-Chief, Duke of Windsor (assumed office on Aug. 17, 1940).

**History.** During January, 1940, the first landing ground for aircraft was opened 3 miles south of Nassau. Under the British-United States accord of Sept. 2, 1940, the British Government leased to the United States for 99 years the waters of Abraham Bay and a small area of land adjacent thereto on Mayaguana Island for the establishment of naval and air bases. A bill for the acquisition by the Bahaman Government of the land involved and its transfer to the United States through the British Government was passed by the House of Assembly at Nassau November 25.

**BALKAN ENTENTE.** A bloc of Balkan states—Greece, Rumania, Turkey, and Yugoslavia—which by the treaty of Feb. 9, 1934, mutually guaranteed their frontiers against aggression by any of the Balkan countries (see 1939 YEAR BOOK, p. 63, for further details).

The sixth annual conference of the Balkan Entente was held at Belgrade on Feb. 2-4, 1940. The Foreign Ministers of the participating powers agreed to extend the life of the entente until February 1948; to maintain their neutral and pacific position with respect to the European War; to keep a "common vigil" for the preservation of their territorial integrity and independence; to strengthen economic ties with one another and with other Balkan states. Their position was cal-

culated to prevent Bulgaria and Hungary from pressing their territorial claims in a way that would drag the Balkans into the war.

These calculations were upset by Italy's entrance into the war, the establishment of a German protectorate over Rumania, and the subsequent Italian attack upon Greece. Both Hungary and Bulgaria obtained large slices of Rumanian territory in defiance of the Balkan Entente. Rumania repudiated its obligations under the pact, and Yugoslavia seemed likely to do so. But Turkey's warning that she would attack Bulgaria if the latter country joined in the Italian attack upon Greece helped to keep Bulgaria out of that conflict. With this single exception, the Balkan Pact at the end of 1940 appeared to have been effectively dissolved and new combinations of the Balkan powers were in process of formation. See GREECE, RUMANIA, TURKEY, and YUGOSLAVIA under *History*.

**BANKRUPTCY AND RECEIVERSHIP.** See BUSINESS REVIEW; RAILWAYS; SUPREME COURT.

**BANKS AND BANKING.** The deposits of banks in the United States reached a new high record level during 1940 as a result of an unprecedentedly heavy inflow of gold from abroad and large-scale purchases of Government bonds by the commercial banks of the country. Gold imports during the year aggregated \$4,749,000,000, marking the culmination of the huge transfers of gold by European countries to the United States brought about by the war. As a result of the enormous gold shipments of 1939 and 1940, the bulk of the monetary gold stocks of Europe has now been shifted to the United States, and future shipments will necessarily decline sharply to correspond with the current level of new gold production, at most.

The pressure on the banks to increase current earnings caused large purchases of Government bonds by both large and small institutions. The reporting member banks of the Federal Reserve System alone showed an increase for the year of \$971,000,000 in their holdings of U.S. Government obligations, chiefly of longer term, while holdings of Government-guaranteed bonds rose by \$300,000,000.

The extremely easy condition of the money mar-

ket was further intensified during the year by the vast gold inflow. The military collapse of France brought a flurry of selling on the part of some banks into the Government bond market, but when it became apparent that Great Britain would carry on the war alone banks and insurance companies vied with each other in adding to their portfolios of high grade bonds, so that in the closing months of the year yields had fallen to the lowest levels on record. The pressure to add to bond portfolios reflected the rise in excess reserves of member banks of the Federal Reserve System to a new high point close to \$7,000,000,000.

The extent to which member banks have built up substantial holdings of longer term Government bonds is shown by the following table summarizing their portfolios of direct Treasury obligations on June 29, 1940:

<i>Due</i>	<i>Amount (Millions of dollars)</i>	<i>Per cent of total</i>
Within 5 years . . . . .	4,022	34.7
5-10 years . . . . .	3,202	27.6
10-20 years . . . . .	3,776	32.5
After 20 years . . . . .	600	5.2
<b>Total . . . . .</b>	<b>11,600</b>	<b>100.0</b>

Larger holdings of longer term Government bonds and a moderate increase in loans made for increased operating earnings for many banks. The outlook for a larger volume of loans brightened as a result of the national defense program. The Federal Reserve System has undertaken to play the role of intermediary in facilitating the placing of defense contracts and sub-contracts, particularly with smaller concerns. The banks of the country, under the leadership of the American Bankers' Association, set up a National Defense Loans Committee, with representatives in each Federal Reserve District, to co-operate in the facilitation of the defense program. The Assignment of Claims Act of 1940 was enacted making legal the hypothecation of Government contracts with banks or other financing institutions, in order to make such agreements "bankable." Contractors could thus finance plant expansion and working capital requirements by a pledge of such agreements. Some disappointment was felt when Federal Loan Administrator Jesse H. Jones set a maximum rate of 1½ per cent on such loans where the War or Navy Department guaranteed reimbursement, on the ground that they were virtually backed by the credit of the United States. It was felt by many bankers that the risk justified a higher rate. Without the guarantee of reimbursement, Administrator Jones stated 4 per cent was to be the maximum rate. However, a moderate volume of loans based on defense contracts had been made by the end of the year, and a number of others were in process

**Credit Control Policy.** Excess reserves of member banks of the Federal Reserve System, which reached a peak in 1939 of \$5,534,000,000, rose to \$6,940,000,000 on Oct. 23, 1940. Thereafter, there was the usual temporary decline, due to the holiday expansion of currency circulation and Government financing, during the closing months of the year.

So long as business activity remained at a relatively low level and unemployment was widespread, the authorities regarded the huge excess reserves with equanimity, and discussion of corrective measures to eliminate them was on a purely academic level. The national defense program caused an increase in business activity to the highest point yet recorded during the last half of 1940, however, and unemployment dwindled rapidly. The problem of excess productive capacity in many fields was transformed into the opposite problem of "bottlenecks." Such circumstances greatly increased the possibility of an inflationary rise in commodity prices, particularly if spending on consumer goods would expand *pari passu* with armament spending. As a result, discussion of measures that would scale down excess reserves and halt the increase in bank deposits was greatly intensified. Chairman Marriner S. Eccles of the Board of Governors of the Federal Reserve System at first urged privately the adoption of a vigorous restrictive credit policy. On Dec. 31, 1940, for the first time in its history, the entire Federal Reserve System sponsored a special report to Congress outlining the steps it favored to meet the danger. This historic document, signed by the Board of Governors, the presidents of the twelve Federal Reserve Banks and the Federal Advisory Council, made five specific recommendations of a monetary character to meet the threat of commodity price inflation resulting from the defense program. In addition to these monetary steps, the report urged direct controls to prevent industrial and labor bottlenecks and a tax policy that would cut down consumption and unessential investment. The five monetary recommendations are as follows:

"1. Congress should provide means for absorbing a large part of existing excess reserves, which amount to seven billion dollars, as well as such additions to these reserves as may occur. Specifically, it is recommended that Congress—

(a) Increase the statutory reserve requirements for demand deposits in banks in central reserve cities to 26%; for demand deposits in banks in reserve cities to 20%, for demand deposits in country banks to 14%; and for time deposits in all banks to 6%.

(b) Empower the Federal Open Market Committee to make further increases of reserve requirements sufficient to absorb excess reserves, subject to the limitation that reserve requirements shall not be increased to more than

double the respective percentages specified in paragraph (a). (The power to change reserve requirements, now vested in the Board of Governors, and the control of open market operations, now vested in the Federal Open Market Committee, should be placed in the same body.)

(c) Authorize the Federal Open Market Committee to change reserve requirements for central reserve city banks, or for reserve city banks, or for country banks, or for any combination of these three classes.

(d) Make reserve requirements applicable to all banks receiving demand deposits regardless of whether or not they are members of the Federal Reserve System.

(e) Exempt reserves required under paragraphs (a), (b), and (d) from the assessments of the Federal Deposit Insurance Corporation.

"2. Various sources of potential increases in excess reserves should be removed. These include: the power to issue three billions of greenbacks; further monetization of foreign silver; the power to issue silver certificates against the seigniorage, now amounting to one and a half billion dollars on previous purchases of silver. In view of the completely changed international situation during the past year, the power further to devalue the dollar in terms of gold is no longer necessary or desirable and should be permitted to lapse. If it should be necessary to use the stabilization fund in any manner which would affect excess reserves of banks of this country, it would be advisable if it were done only after consultation with the Federal Open Market Committee, whose responsibility it would be to fix reserve requirements.

"3. Without interfering with any assistance that this Government may wish to extend to friendly nations, means should be found to prevent further growth in excess reserves and in deposits arising from future gold acquisitions. Such acquisitions should be insulated from the credit system and, once insulated, it would be advisable if they were not restored to the credit system except after consultation with the Federal Open Market Committee.

"4. The financing of both the ordinary requirements of Government and the extraordinary needs of the defense program should be accomplished by drawing upon the existing large volume of deposits rather than by creating additional deposits through bank purchases of Government securities. We are in accord with the view that the general debt limit should be raised; that the special limitations on defense financing should be removed; and that the Treasury should be authorized to issue any type of securities (including fully taxable securities) which would be especially suitable for investors other than commercial banks. This is clearly desirable for monetary as well as fiscal reasons.

"5. As the national income increases a larger and larger portion of the defense expenses should be met by tax revenues rather than by borrowing. Whatever the point may be at which the budget should be balanced, there cannot be any question that whenever the country approaches a condition of full utilization of its economic capacity, with appropriate consideration of both employment and production, the budget should be balanced. This will be essential if monetary responsibility is to be discharged effectively."

No sooner was this report issued than it became clear that a fundamental split within the Administration had developed over credit policy. Secretary of the Treasury Morgenthau said that the report had produced a needless decline in the Government bond market, and that he regarded the measures proposed as unnecessary and as an artificial interference with the equilibrium of the money market. Federal Loan Administrator Jesse H. Jones as-

serted that he was in favor of low interest rates, and thus by implication was diametrically opposed to the proposals of the Federal Reserve System. The banking community, however, for the most part enthusiastically supported the Eccles program, although feeling some hesitation about putting into the hands of the Federal Open Market Committee

the rise. Presumably, in the event of a future severe decline in the Government bond market, these holdings would be replaced, and the market would thus be supported to some extent.

Changes in the principal assets and liabilities of the twelve Federal Reserve Banks during the year were as follows:

#### PRINCIPAL ASSETS AND LIABILITIES OF THE 12 FEDERAL RESERVE BANKS

[In millions of dollars]

1940 End of Month	Gold certificates on hand and due from U.S. Treasury	Bills dis- counted	U.S. Government bonds	Treasury notes	Federal Reserve notes in actual circulation	Member bank reserve deposits	Treasury deposits
January	15,552	7	1,344	1,133	4,832	12,150	549
February	15,804	7	1,344	1,133	4,872	12,328	562
March	16,068	4	1,342	1,133	4,951	12,423	702
April	16,418	3	1,337	1,129	4,941	12,919	446
May	16,983	3	1,347	1,130	5,057	13,217	365
June	17,743	2	1,338	1,128	5,199	13,781	234
July	18,189	4	1,321	1,127	5,248	13,498	694
August	18,606	4	1,319	1,117	5,370	13,541	810
September	18,928	5	1,319	1,115	5,450	13,727	756
October	19,280	4	1,379	954	5,577	14,208	349
November	19,575	4	1,297	903	5,743	14,215	250
December 24	19,681	4	1,285	900	5,965	13,837	481

the power to increase legal reserve requirements of member banks to a level double the maximum now specified in the law. President Roosevelt indicated that he had reached no decision on the subject of credit policy, giving the impression that if a substantial rise in commodity prices should occur he might throw his support in favor of at least some of the proposals made by the Federal Reserve System.

The comprehensive investigation of monetary and banking matters authorized by the Senate in 1939 was not pursued by the Banking and Currency Committee with any vigor, owing to the European war.

Fluctuations in member bank excess reserves during 1940 were as follows:

#### EXCESS RESERVES OF MEMBER BANKS

[Million dollars]

January 31	\$5,559	July 31	\$6,514
February 29	5,692	August 31	6,525
March 30	5,828	September 30	6,555
April 30	6,149	October 31	6,960
May 31	6,385	November 30	6,849
June 29	6,857	December 24	6,438

**Federal Reserve Banks.** The Federal Reserve Banks reduced moderately their holdings of U.S. Government obligations in the course of the year. With Government bond prices rising to new high levels, the Reserve Banks continued the policy of stabilizing quotations to some extent by selling on

**Bank Regulation Changes.** Despite the active discussion of fundamental changes in bank legislation to pave the way for a more restrictive credit policy, no important banking laws were passed during the year. A bill to regulate bank holding companies more closely failed of passage, largely because it was unsatisfactory to the Treasury, which desired a more drastic measure. Following its controversy with the Bank of America of California, the Treasury made clear that it would approve nothing less than a bill requiring the dissolution of bank holding companies within a specified period of years.

Changes in loans, investments, and deposits of reporting member banks of the Federal Reserve System, month by month, as reported in the *Federal Reserve Bulletin*, are shown in the table at the foot of this page.

See EXPORT-IMPORT BANK; FARM CREDIT ADMINISTRATION; FEDERAL HOME LOAN BANK BOARD; FINANCIAL REVIEW; INTERNATIONAL BANKING AND FINANCE; MONEY, U.S. STOCK OF.

JULES I. BOGEN.

**BAPTISTS.** A religious group, probably evolved from the Anabaptist movement of the 16th century, which adopted the principle that immersion is essential to valid baptism. The first Baptist churches were established in Amsterdam in 1608, in London in 1611, and in America, probably at Providence, R.I., in 1639. There are 21 denominations in the United States which use the

name *Baptist*, the largest of which are treated below. For census statistics, see RELIGIOUS ORGANIZATIONS.

**Southern Baptist Convention.** This body of the Baptist denomination was formed in 1845, when Southern Baptists withdrew from the national organization on account of the slavery issue and also for the better administration of the work of the Convention. Since that time it has functioned, not as a new denomination, but as a separate organization for the purpose of directing missionary, educational, and general denominational work in the white Baptist churches of the Southern and Southwestern States. According to the official *Handbook* for 1940 the Southern Baptist Convention comprised 18 State conventions.

The annual session of the Southern Baptist Convention was held in Baltimore, Md., June 12-16, 1940. The various boards and agencies of the convention showed decided gains in receipts for the year. The director of the Work of Promotion in the Executive Committee, Dr. J. E. Dillard, led an "Every Member Canvass" during the week of Nov. 25 to Dec. 8, 1940, with the objective of securing weekly subscriptions totaling \$45,000,000.

The officers elected for 1939-40 were: The Rev. W. W. Hamilton, D.D., LL.D., of New Orleans, La., President; Francis Asbury Davis, Baltimore, Md., and Wm Cox Allen, Greenville, S.C., Vice-Presidents; the Rev. Hight C. Moore, D.D., Litt D., of Nashville, Tenn., and Mr. J. Henry Burnett of Macon, Ga., Recording Secretaries; and the Rev. Austin Crouch, D.D., of Nashville, Tenn., Executive Secretary, and the Rev. J. E. Dillard, D.D., of Nashville, Tenn., Secretary of Promotion. Headquarters are at 161 Eighth Avenue, North, Nashville, Tenn.

The following table gives statistics compiled by the denomination for 1936 and 1940.

Item	1936	1940
Churches (congregations)	24,671	25,018
Ordained ministers	21,881	22,493
Church members	4,482,315	4,949,174
Sunday Schools	22,704	23,754
Enrolled in Sunday Schools	3,173,356	3,523,853
Enrolled in Baptist Training Unions	693,186	815,528
Enrolled in Missionary Unions	595,852	747,845
Value of Church property	\$203,469,481	\$214,724,695
Gifts to local work of churches	\$24,201,802	\$30,869,268
Gifts to missions & Benevolences	\$4,986,885	\$6,267,263
Total contributions	\$29,188,687	\$37,136,531
Schools & colleges fostered	26,203	28,892

School property	\$25,490,369	\$28,392,825
Endowment funds	\$6,221,150	\$6,670,075
Property of 18 Children's Homes	\$10,075,845	\$15,268,099
Property of 20 hospitals		

**National Baptist Convention of America (NEGRO).** The Convention held its 1940 session on the Simmons University Campus with the Baptist Churches of Louisville, Kentucky, as hosts, from Wednesday, September 4 to Sunday, September 8, inclusive. The Woman's Auxiliary met at Zion Baptist Church. The parent body and the Woman's Auxiliary met on the same dates. The theme of the Convention was "The Place of Christianity in this World's Conflict." Representatives were in attendance from 35 States in the union, from Liberia—western Africa, from the Bahama Islands, the Republic of Panama, and from Canada. Thirty High Points were recorded in the Convention's activity for this session. Among the objectives for 1940-41 were building of a home for the aged men and women and an Orphanage in

Dexter, New Mexico; increased financial support to foreign fields; more educational money for the four schools and colleges endorsed by the Convention through its Educational Board, namely the Lynchburg Theological Seminary and College in Lynchburg, Virginia, Guadalupe College in Seguin, Texas; Georgia Baptist College at Macon, Georgia, the Florida Normal and Industrial College at St. Augustine, Florida. The Convention condemned in strong terms religious and racial intolerance; it accepted greetings from the Southern Baptist Convention brought by Dr. Nobel Y. Beall of Atlanta, Georgia; it renewed its membership and representation in the Baptist World's Alliance; it went on record as favoring more economy in the operation of the Convention, thus increasing the contributions for home mission, foreign mission, and education; it was pronounced and emphatic in opposing the sale of intoxicating liquors, the open saloon, and urging a prohibition movement in America; it called upon the administration in Washington to enforce the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution, along with many other far-reaching actions calculated to bring an era of good will and peace on earth. It reported an addition of more than 150,000 communicants for the Convention year, bringing its numerical strength, according to its Statistical Secretary, to more than 2,650,000 members. The Convention reported as having raised, between the parent body and its various Boards during the fiscal year, a little more than one and a quarter million dollars.

The next session of the Convention was awarded to Shreveport, Louisiana, September 10-14. The officers selected for 1940-41 are Rev. G. L. Prince, D.D., President, 2610 Avenue L, Galveston, Texas; Rev. C. P. Madison, D.D., Secretary, 2925 Woodlawn Avenue, Norfolk, Virginia; Rev. A. A. Lucas, Treasurer, 5109 Farmer Street, Houston, Texas; Rev. G. C. Coleman, D.D., Vice-President, 867 37th Street, Oakland, California; Rev. Henry A. Boyd, Secretary Sunday School Congress, Railroad Commission, and National Baptist Publishing Board, 523 Second Avenue, North, Nashville, Tennessee; Mrs. M. A. B. Fuller, President Woman's Auxiliary, 1105 Angelina Street, Austin, Texas; Mrs. Eva Ball White, Corresponding Secretary Woman's Auxiliary Convention, 848 Edmondson Avenue, Baltimore, Maryland. Denominational headquarters are at 523 Second Avenue, North, Nashville, Tennessee.

**Northern Baptist Convention.** This body of the Baptist denomination, according to the *Annual* of the Northern Baptist Convention, was composed in 1940 of 36 conventions in 33 States, the District of Columbia, and Puerto Rico. The thirty-third annual meeting of the Northern Baptist Convention was held in Atlantic City, N.J., May 21-26, 1940. Its general theme was "The Light Shinereth." The officers elected for 1940-41 were: President, Hon. Ernest J. Millington, Cadillac, Mich.; First Vice-President, Rev. L. M. Hale, Wichita, Kan.; Second Vice-President, Prof. J. C. Morris, Jr., Cambridge, Mass.; Corresponding Secretary, the Rev. Joseph C. Hagen, D.D., Summit, N.J.; Recording Secretary, the Rev. Clarence M. Gallup, D.D., New York, N.Y.; and Treasurer, Harold J. Manson, Brooklyn, N.Y. The leading denominational papers were: *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Ia.); *Missions* (New York); *Watchman-Ex-*

*aminer* (New York); and *U.S. Baptist*, (Washington, D.C.).

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands. The work of the Convention covers domestic, city, and foreign missions; higher education, social service, Sunday schools, and pensions for clergy.

The total membership of the Northern Baptist Convention for 1939-40 was 1,549,012, distributed among 7526 churches, mostly above the Mason and Dixon Line. The total amount of funds received and expended by the churches and their agencies, as of Apr. 30, 1940, was \$15,957,796 for church operating expenses and \$3,503,929 for missions, education, and philanthropy.

Headquarters of the General Council, the executive body to which is entrusted the work of the Convention between annual meetings, are at 152 Madison Avenue, New York, N.Y.

**BARBADOS.** A British West Indian crown colony. Area, 166 square miles; population (1938 estimate), 193,082. During 1938 there were 5327 births, 3743 deaths, and 869 marriages. Capital Bridgetown, 15,200 inhabitants.

**Production and Trade.** The chief products are sugar (156,443 tons in 1939) and Sea Island cotton. The British Government agreed to purchase all exportable sugar during 1940. There are about 107 sugar factories and four rum distilleries. During 1939, 9103 tourists visited the island. Imports in 1939 totaled £2,445,753; exports, £2,028,991. Of the exports, sugar accounted for £1,278,295; molasses, £575,358; rum, £9887; cotton, £233. During 1939, a total of 1139 vessels of 2,428,829 net tons entered Bridgetown. The Royal Dutch Air Lines connect Barbados with Trinidad and Curaçao.

**Government.** For 1940-41 revenue was estimated at £573,597 and expenditure at £653,967. Among the special items of expenditure were a £25,000 contribution to Imperial government war expenditure and £8000 required to deal with emergency conditions. The public debt on Mar. 31, 1939, was £449,170. A governor, who is aided by an executive council, administers the government. There is a legislative council of 9 members, and a house of assembly of 24 members elected by the people. Governor and Commander-in-Chief, Sir E. J. Waddington (appointed Feb. 11, 1938).

**History.** It was announced on Feb. 21, 1940, that the British Colonial Secretary was awaiting an explanation of the Barbados legislative council's action in deleting the section relating to peaceful picketing from the local Trade Unions Bill which had been passed by the house of assembly. By May of 1940 there was an increase of 14 per cent in the working man's budget since the start of the war. The legislature was asked to recommend a 10 per cent bonus to lower-paid government employees, and the Sugar Producers' Association added a 10 per cent bonus to the weekly wages of agricultural workers on sugar estates. Progress was made during 1940 in settling Barbadians in St. Lucia (q.v.) on a large sugar estate purchased by the government. See *BRITISH WEST INDIES* for the report of the Royal Commission.

**BARBUDA.** See *LEEWARD ISLANDS*.

**BARBIA.** See *EUROPEAN WAR* under *Campaigns in Africa*.

**BARLEY.** The barley crop of the United States in 1940 was estimated by the U.S. Department of Agriculture at 309,235,000 bu., 12.5 per cent more than the 274,767,000 bu. grown in 1939 and about 37 per cent above the 1929-38 average and was harvested from 13,394,000 acres versus 12,644,000 acres in 1939. The current large production, second only to 1929, was held due to increased acreages and above average yields. The acre yield in 1940 averaged 23.1 bu. and in 1939, 21.7 bu. The production in 1940 of leading barley States was: Minnesota 57,348,000 bu., California 33,516,000, South Dakota 30,821,000, North Dakota 28,064,000, Wisconsin 24,525,000, Nebraska 22,544,000, and Kansas 18,176,000 bu. The seasonal average price (preliminary) per bu. received by farmers was 38.7 cents and the estimated value of production was \$119,719,000 in 1940 compared to 40.3 cents and \$110,826,000 in 1939. See *Crop Production Table* under *AGRICULTURE*.

**BASEBALL.** The national pastime provided some exciting days, not to mention moments, in the erratic big league races of 1940. To begin with the New York Yankees lost the American League pennant, and strangely enough that was sensational news, for the New York boys had garnered pennants for the past four consecutive years. Another anomaly was the consistently excellent playing of the Brooklyn National Dodgers, a team that belied all the evaluations and prognostications of the so-called experts.

Failure of the Yankees provoked the closest race the American League had seen in 18 years. In an exciting contest between the Detroit Tigers and Cleveland Indians for the American League pennant, the lead changed 18 times until, tied for the third time, they met in a decisive series in late September and the Tigers grabbed a precarious lead which they maintained until the end, winning by the narrow margin of one full game. The Indians lost the pennant formally in a game at Cleveland September 22 and the local fans expressed their great disappointment by showering the Detroit players with large quantities of fruit and vegetables, much of which was said to be not altogether fresh.

The National League pennant was carried off by the Cincinnati Reds, after the Brooklyn Dodgers had led the league for much of the early part of the season. Brooklyn finally finished second, a full 16 games behind the champions, but they began the season by winning the first nine games.

In the World Series, the Tigers fell down before the superior pitching of the Cincinnati team, and the see-saw series ended when the Reds conquered the Tigers in the seventh and deciding game in Cincinnati, with Paul Derringer 'outpitching' Buck Newsom for a 2 to 1 victory, thus presenting Cincinnati with its first world's championship since 1919.

At Tampa, Fla., an all-star inter-league game was played for the Finnish relief fund, and in it the Nationals beat the Americans, 2-1. And in the regular annual all-star game, played in St. Louis in mid-season, the Nationals were first again, 4-0.

The manager of the Cleveland Indians, Oscar Vitt, was dismissed on October 28 following criticism of him by the players of his team. They charged that his constant dissatisfaction with their efforts gave them the "jitters." The players staged an open rebellion on June 13.

Freddy Fitzsimmons of the Brooklyn Dodgers led both major leagues in pitching, with a record

of 16 won and 2 lost for a percentage of .889. Johnny Mize, first baseman for the St. Louis Cardinals, was the year's home run king, with 43 circuit clouts. Hank Greenberg of the Tigers knocked out 41 homers, and was tied in that respect with Frank McCormick, first baseman of the Reds. The leading batsmen were Debs Garms with .355 and Joe DiMaggio with .350, representing the National and American Leagues respectively.

In the minor leagues, Rochester won the International League pennant, but Newark won the playoffs and thereafter conquered Louisville, American Association play-off winner, in the Little World Series. Kansas City was the leader at the close of the regular American Association race.

In the Dixie series, Nashville, Southern Association pennant bearer, defeated Houston, representing the Texas League. Seattle captured the championship in the Pacific Coast League and Scranton once again carried off the Eastern League pennant.

**BASKETBALL.** In the manly art of basketball, American colleges continued to exhibit selective specimens of brain and brawn in savage contests throughout the country. Nine teams appeared to be the leaders in their field. In alphabetical order, they were: Colorado, Duquesne, Indiana, Kansas, New York University, Purdue, Rice, Santa Clara, and Southern California. The national invitation tournament, the court Rose Bowl affair, was won by Colorado, and the National Collegiate A. A. championship was captured by Indiana, yet neither team could claim to be the master of the other. Both Colorado and Southern California failed miserably in the N. C. A. A. The finalists were Indiana, which could not win the Big Ten championship, and Kansas, which had extreme difficulty in gaining a tie for first in the Big Six. The Indiana quintet triumphed 60 to 42.

But that is the way of basketball, a game of imponderables. N. Y. U. won 18 games in a row and then succumbed before the City College quintet, a team that was more distinguished for its failures than for its victories.

**BASUTOLAND.** See BRITISH EMPIRE.

**BAUXITE.** See ALUMINUM; ARKANSAS under *Mineral Production*.

**BAVARIA.** See GERMANY under *Area and Population*.

**BECHUANALAND.** See BRITISH EMPIRE.

**BETTER.** See ENTOMOLOGY, ECONOMIC.

**BEETS.** See SUGAR.

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIUM.** A kingdom of Western Europe, occupied by German military forces in May, 1940. Capital, Brussels. Ruler in 1940, King Leopold III, who succeeded to the throne Feb. 23, 1934.

**Area and Population.** On Dec. 31, 1939, Belgium had an area of 11,775 square miles and an estimated population of 8,396,000. On May 19, 1940, the districts of Eupen and Malmédy (area, 382 sq. mi.; pop. about 60,000) and Moresnet were detached from Belgium and incorporated in Germany, leaving Belgium with an area of about 11,393 square miles and a population of about 8,330,000. Estimated populations of the chief cities on Dec. 31, 1938: Brussels and suburbs, 912,774; Antwerp, 273,317; Ghent, 162,858; Liège, 162,229.

**Education and Religion.** Primary, infant, and adult elementary schools on Dec. 31, 1938, numbered 13,438 with 1,222,164 pupils. There were 273 secondary schools of all kinds with 86,279 students, and four universities (at Brussels, Louvain, Ghent,

and Liège) with 10,775 students. The majority of Belgians are Roman Catholics.

**Production.** Manufacturing, mining, intensive agriculture, and commerce have enabled Belgium to support one of the densest populations of Europe (712 per square mile in 1938). Estimated production of the chief crops in 1939 was (in metric tons): Wheat, 349,000; barley, 51,100; rye, 349,400; oats, 724,200; potatoes, 3,323,200; beet sugar, 240,500 (1939-40); tobacco, 5300; linseed, 25,100; flax, 46,700. Livestock as of Jan. 1, 1939: 1,689,680 cattle, 264,650 horses, 960,372 swine. Mineral and metallurgical production (1939), in metric tons, was: Coal, 29,846,890; briquets, 1,525,190; coke, 5,176,650; pig iron, 3,068,200; wrought iron, 31,060; steel, 3,036,160; wrought steel (except semi-finished), 2,202,420. Leading manufactures include glass, paper, cardboard, cement, cotton yarn, rayon, metal products, alcoholic beverages, furniture, etc.

**Foreign Trade.** Imports of Belgium and Luxembourg in 1939 totaled 19,690,000,000 paper francs (23,165,507,000 in 1938); exports, 21,670,000,000 (21,723,853,000 in 1938). Peace-time trade is mainly with France, Germany, the United Kingdom, United States, the Netherlands, and the Belgian Congo (see YEAR BOOK, 1939). Following the German military occupation in 1940, Belgium's trade was confined to Germany and countries under its military or economic control. See TRADE, FOREIGN.

**Finance.** The 1940 budget provided for total receipts of 12,350,000,000 francs and expenditures of 20,000,000,000, including 8,000,000,000 francs for national defense. Following the German conquest, loans of 6,000,000,000 francs were issued and new taxes designed to raise an additional 1,000,000,000 francs were imposed to meet the heavy costs of the German military occupation and other emergency expenses. Public debt on Dec. 31, 1939, 59,318,300,000 francs (domestic, 40,317,600,000; foreign, 19,000,700,000). The unit of currency for foreign exchange transactions was the belga, equal to five Belgian francs; it averaged \$0.1685 in 1939. See *History*.

**Transportation.** Previous to the German invasion, Belgium had 7068 miles of railway line, 20,244 miles of highways, an extensive network of rivers and canals which carried about one-fourth of the total merchandise traffic, 8313 miles of air-routes in Europe and Africa (August, 1939), and a merchant fleet of 88 ships totaling 353,997 gross tons (20 vessels totaling 64,084 gross tons were lost in 1939 as a result of the war). During 1939, 9524 vessels of 19,389,516 tons entered the port of Antwerp.

**Government.** The Constitution of 1831, amended in 1921, vested executive power in the King, acting through a ministry responsible to Parliament. There was a Senate of 167 members and a Chamber of Deputies of 202 members, all elected for four years. Deputies were elected by universal male and restricted female suffrage. Of the Senators, part were elected by direct suffrage and part indirectly by the provincial councils. Premier at the beginning of 1940, Hubert Pierlot (Catholic), heading a coalition government comprising Catholic, Socialist, and Liberal members and two non-party men. For the standing of the parties in Parliament after the 1939 elections, see 1939 YEAR BOOK, p. 71. See *History* for 1940 developments.

#### HISTORY

**Prelude to War.** From January 1 to the fatal 10th of May, 1940, Belgium lived under the con-

stant threat of invasion while suffering acutely from the economic effects of the European conflict (see YEAR BOOK, 1939, p. 71 f. for background). On May 10 began the powerful German surprise assault that in the course of 18 days overran practically all of the country and forced King Leopold to surrender his shattered army and his ruined kingdom.

The months previous to the invasion were marked by the reorganization of the Pierlot Cabinet on January 5, the completion of work on the series of strong defense systems guarding the German frontier, the progressive mobilization of additional military classes, and the adoption of measures against "fifth column" elements. In the January cabinet crisis, the Pierlot Ministry submitted its collective resignation to the King. Leopold called on M. Pierlot to form a new government and the Premier succeeded in assembling a new Catholic-Socialist-Liberal cabinet containing 14 instead of 18 members. The principal Ministers were: Foreign Affairs, Paul-Henri Spaak (Socialist); Finance, Camille Gutt (nonparty); War, Lieut. Gen. Henri Denis (nonparty). All but one member were holdovers from the previous ministry. The opposition of the Liberal party to the government's policy of bilingual education led Premier Pierlot on April 25 to again submit the cabinet's resignation. However King Leopold on April 26 refused to accept the resignation on the ground that it was "no time for ministerial crises on purely internal grounds."

Information reaching the Brussels authorities caused the mobilization of additional troops on January 14 and the speeding up of work on the defense lines. By the middle of March about 700,000 men out of a possible 1,000,000 were under arms, or nearly 9 per cent of the population. The cost of mobilization was estimated at \$600,000 a day. On March 20 a law was passed suppressing all Communist publications to end anti-war propaganda among the conscripts. The expulsion and arrest of the nine Communist Deputies in the Chamber was threatened.

With the revelation of the role "fifth column" elements had played in the German conquest of Norway, the Belgian Government took further protective measures. The activities of Germans and other aliens were more strictly controlled, as were the pro-German activities of the Flemish Fascists. On the eve of the invasion, the government presented to Parliament three tax proposals intended to raise an additional 900,000,000 Belgian francs for national defense.

During the January war scare, the Belgian Government again indicated that it was prepared to give immediate armed assistance to the Netherlands in case of an attack upon that country. However the King stubbornly refused to permit discussions with the Allied general staffs to facilitate co-ordination of Belgian and Allied military efforts in case of a German invasion. General van den Bergen, Belgian Chief of Staff, was replaced by a relatively inexperienced officer, General Michiels, on January 31 because he apparently favored the formation of a government that would co-operate with the Allies. The Brussels Government on February 14 signed a war trade agreement with Britain and France that was expected to curtail Belgian re-exports to Germany. But in every respect the Belgian Government and people held to the policy of strict neutrality adopted at Leopold's insistence in 1936 (see YEAR BOOK, 1936, p. 93).

**The German Invasion.** The simultaneous German invasion of Belgium, Luxemburg, and the Netherlands was launched without warning at dawn on May 10 (see EUROPEAN WAR for a complete account). While German armored divisions thrust through the strongly defended frontier defenses, bombers rained death and destruction upon the principal Belgian airports, cities, lines of communication, and other defense nerve centers. Thousands of German parachute troops landed behind the Belgian front and joined with "fifth column" elements in spreading confusion and hamstringing the nation's resistance.

The Belgian Government and army were not caught off guard. From the moment of crossing the frontier, the invaders encountered stubborn resistance. No sooner did the first German bomber appear over Brussels at 4 a.m. than the government sent an appeal for aid to Britain and France. Within half an hour they received a pledge of assistance and shortly afterward British and French mechanized troops crossed the Belgian frontier in fulfillment of this promise.

**Nazi Statement.** At 7:30 a.m. the German Ambassador to Brussels handed Foreign Minister Spaak a lengthy memorandum, identical with that delivered to the Netherlands Government at the same time. It announced the Reich's intention to occupy Belgium "to insure its neutrality . . . with all the Reich's military means of power" in view of "incontrovertible proof that an Anglo-French attack on Germany is immediately imminent and that this attack will take place against the Ruhr over Belgium and the Netherlands." The memorandum charged that Belgium, in violation of its neutrality, had secretly sided with Britain and France and was prepared to support the alleged Anglo-French plan of attack "in every direction." It stated that "German soldiers are not entering Holland and Belgium as enemies," and continued:

The German Government further declares that Germany does not intend by these measures to attack the integrity of the Kingdom of Belgium and of the Kingdom of the Netherlands or their possessions, or their property in Europe or in their colonies, either now or in the future. The Belgian and Netherlands Governments today still have it in their power to safeguard the welfare of their peoples at the last moment by insuring that no resistance will be offered to the German troops. The German Government herewith requests the two governments to issue the necessary orders without delay. Should the German troops encounter opposition in Belgium or Holland, it will be crushed with every means. The Belgian and Netherlands Governments alone will bear the responsibility for the consequences for bloodshed which would then become unavoidable.

**Belgian Defiance.** Before the German Ambassador could read the memorandum, Foreign Minister Spaak informed him that Belgium had been invaded without provocation and would "resist to the death." The cabinet met at 1 p.m. and authorized the application of carefully prepared war emergency plans. Evacuation of cities and towns in the path of the invaders was begun. Many Belgians suspected of disloyalty were rounded up and imprisoned, including the Rexist (Fascist) leader, Léon Degrelle. Schools were closed and food supplies placed under the control of mayors in each city and town. The Bourse was closed, exchange dealings suspended, and the conversion of national bank notes prohibited. King Leopold assumed supreme command of the armed forces.

Meeting in the early afternoon, Parliament heard Premier Pierlot denounce the German invasion as a wanton violation of Hitler's pledge of Oct. 13,

1937, to respect Belgium's inviolability and integrity so long as Belgium refrained from participating in military action against the Reich. He said:

Despite this solemn promise the German forces violated our frontiers and invaded our territory today, proving for a second time in 25 years what worth can be attached to their promises.

France and Britain have not broken their promises (see *YEAR BOOK*, 1937, p. 86-87) and are giving us, according to their guarantee, all military, naval, and aerial support in their power.

Holland, Luxembourg, and Belgium are united as never before in their history. Belgium has neglected nothing for her defense.

**Defense Lines Broken.** Parliament and both the Walloon and Flemish sections of the country rallied behind the government's slogan of "resistance to the death." British and French troops en route to the Belgian battle front had an enthusiastic popular reception. However the failure of both the Belgian and Netherlands Governments to co-ordinate their defense measures with each other and with the Allied general staffs previous to the invasion greatly handicapped their military operations. The tide of war swiftly turned against the Belgians and their Allies (see *EUROPEAN WAR*). On May 17 the government withdrew from Brussels to Ostend before the inexorable German military machine. On May 28, with his decimated army exhausted and threatened with annihilation, King Leopold stunned his people and the world by unconditionally surrendering some 300,000 men—all that remained of Belgium's army of over 800,000.

**Leopold's Capitulation.** The King's surrender, enhancing the critical position of the hard-pressed British and French armies, aroused the most severe criticism throughout the anti-German world until the circumstances under which he acted became better known. The Belgian Government and many leading Belgian personalities, including the Duchess of Vendôme, sister of Leopold's father, repudiated and denounced the capitulation. Premier Reynaud of France, in a radio broadcast on May 28, declared that "in full battle, King Leopold III without a word to the French and British soldiers who, in response to his anguished appeal had come to the assistance of his country, laid down his arms. It is a deed without precedent in history." Reynaud's accusation was later disproved, as were other charges of treachery, betrayal, and pro-Germanism leveled at the King.

As early as May 21 King Leopold, in conferences with General Weygand, the new French commander-in-chief, and General Gort, commander of the British armies in France, at the Belgian headquarters at Saint André near Bruges, pointed out that the Belgian military position was hopeless unless further British and French aid was forthcoming. When the attempted Anglo-French counter-attack failed and the Germans on May 24 launched a four-day offensive against the Belgian forces, the Belgian Government left Ostend for Paris. However Premier Pierlot and three other cabinet ministers remained with the King in an effort to persuade him to join the Belgian Government in the French capital.

On the night of May 24-25, the four ministers visited the King in his new headquarters in the chateau of Wynendael near Thourout. He told them that the Belgian army was bearing the brunt of the German attack and suffering heavy losses, and that he favored Belgium's withdrawal from the war. According to a subsequent statement by Foreign Minister Spaak, one of those present, the King not only refused to leave the country but

insisted that the government remain in Belgium with him. The ministers protested that the Belgian cause might be irreparably lost if ruler and government were permitted to fall into German hands. They resolutely opposed capitulation and on the morning of May 25 left for Paris via London. While they were in London on May 26, the King telephoned them, requesting the signature of a cabinet minister on two blank royal decrees. All 13 members of the cabinet, which was reunited later that day in Paris, declined to sign, thus depriving the King's subsequent actions of constitutional validity.

During May 25 Leopold issued an appeal to his troops to resist the attack with all their strength. But the same afternoon he informed Gen. Sir John Dill, chief of the British Army's Imperial Staff, by letter that he had no choice but to surrender. The same advice was telephoned to Prime Minister Churchill the same evening by Sir Roger Keyes, British liaison officer at Leopold's headquarters. On the night of May 27 the King sent an emissary to ask the German terms. The reply was that "The Fuehrer requires unconditional surrender." The Belgians were given until 4 a.m. on May 28 to comply. Before the expiration of this time limit, the Belgian Cabinet met again in Paris and again refused to approve the King's course. Nevertheless Leopold at 4 a.m. issued the order for the Belgian troops to lay down their arms. Some of the troops refused to comply and joined the British and French in their flight to Dunkirk. The King himself was taken prisoner and placed under guard for the remainder of the year in his castle at Laeken near Brussels.

**The Government's Course.** On the day Leopold surrendered, the Belgian Government in Paris published its repudiation of his action. Premier Pierlot declared "No act of the King has effect unless countersigned by the Minister. . . . Dissolving the link uniting him and the nation, the King has placed himself under the authority of the invader. Under these circumstances he is no longer in a position to govern." The Chambers have to meet. During the interval the King's constitutional powers will be exercised on behalf of the Belgian nation by the Ministers meeting in council." The cabinet unanimously agreed to continue the struggle and make no peace until Belgium's independence, rights, and dignity were restored. On May 30 it issued decrees denying the King's right to rule Belgium and prolonging the cabinet's powers for the duration of the war.

This policy was supported by the colonial administration of the Belgian Congo and by Belgian diplomatic and consular officials in foreign countries. It was unanimously approved by 89 Deputies and 54 Senators of the Belgian Parliament who met in Limoges, France, on May 31. This was not an official session of Parliament as less than half the members were present.

The government immediately took steps to raise a new Belgian army of over 200,000 men in France and to mobilize other Belgians for the production of military supplies. Equipment for 60,000 men had been sent to France as a precaution during the early days of the German invasion. The government in exile also had at its disposal 23,000,000,000 gold francs that had been shipped to London and New York previous to the German attack. The British and French Governments gave assurances that as long as the Belgian Government continued its military co-operation with them, it would be

left in control of the Belgian Congo. The Belgian merchant fleet of some 200 vessels, mostly small, was placed at the Allies' disposal.

**Transfer to London.** Upon the capitulation of France, two members of the Belgian Government—Ministers Camille Gutt (Finance) and Albert de Vleeschauwer (Colonies)—were sent to London to maintain contact with the British Cabinet. Premier Pierlot and the remainder of the cabinet established the Belgian Government at Vichy. There they aided in the repatriation of some 1,700,000 Belgian refugees who had fled to France, but found co-operation with the Pétain regime increasingly difficult due to German pressure upon the French. In mid-September the Pétain Government withdrew its recognition of the Belgian Government, which unanimously decided to transfer its powers to the two Belgian Ministers in London. Premier Pierlot and Foreign Minister Spaak set out for the British capital, after releasing the other cabinet ministers in France from their oaths of office. They were held in Spain for over a month at German instigation, but finally reached London on October 22.

Recognized by the Allied governments and by Washington as the legal government of Belgium, the four cabinet ministers in London proceeded to raise a third Belgian Army for the purpose of restoring Belgium's territorial integrity and independence and liberating the imprisoned King Leopold. (Leopold's status as a prisoner of war instead of a traitor had been recognized by the Belgian Ambassador to London as early as July 21 in a broadcast over the British Broadcasting Corporation's network.) By a decree of December 13 Belgians in all territories unoccupied by the Axis powers and belonging to the 1925-41 military classes were called up for service. Veterans who had escaped to England from the battles of Flanders and France served as the nucleus for the new Belgian military and air force organized in Great Britain. The air force participated creditably in the Anglo-German aerial warfare during the remainder of the year.

**Nazi Rule in Belgium.** While fighting in Belgium was still in progress, the German Government on May 19 proclaimed the reincorporation in the Reich of Eupen, Malmédy, and Moresnet, the former German districts ceded to Belgium by the Versailles Treaty. The three districts were added to the Aachen District of the Rhine Province of Prussia. On May 20 Gen. Baron Alexander von Falkenhausen was named military administrator of both Belgium and the Netherlands.

The German administrator attempted to persuade King Leopold to assume responsibility for the administration of the country, but he refused, insisting that his status was that of a military prisoner. Efforts to win the co-operation of the Belgian Government in exile were likewise unsuccessful. The Belgian people as a whole offered the same passive resistance to the German occupation as in 1914-18. Some Flemish Separatists and members of Léon Degrelle's Rexist (Fascist) movement indicated their willingness to collaborate with Hitler's "new order" in Europe. But representing a small minority, they were not entrusted with the formation of a Belgian government. At the year-end Belgium remained the only German-subjugated country except Poland that had no native administration.

Chancellor Hitler ordered the release of all Belgian war prisoners except officers and non-commissioned officers on July 19, and made other efforts

to win the co-operation of the Belgian people. However sabotage and other forms of opposition to the invaders mounted as the Belgian people recovered from the shock of the May attack, and the German authorities resorted to harsher methods. Collective fines and wholesale imprisonments were imposed upon communities where sabotage occurred. The death penalty was imposed for sabotage. Flemish separatism was encouraged by the German authorities, as during the World War. All anti-Nazi statements were ordered deleted from Belgian school books. All the familiar Nazi controls of communication and of political, economic, and cultural life were introduced. The annual Armistice Day celebration was prohibited. The Universities of Brussels, Ghent, and Liège were placed under German-appointed administrators and rectors. Anti-Jewish measures were introduced. During three weeks of December, it was reported, 250 trade union leaders and 65 politicians were arrested by the German authorities in Antwerp Province alone for sabotage and anti-German activities.

**Economic Situation.** Belgium's economic situation had become serious even before the German invasion (see YEAR BOOK, 1939). But it was completely disorganized by the *blitzkrieg*. According to a survey by the German-controlled Commissariat for Reconstruction issued December 5, the 18 days of warfare in Belgium caused damage estimated at 13,000,000,000 Belgian francs. Only one-fifth of the kingdom's 2500 towns and villages escaped damage. The destruction included 9832 houses razed, 24,156 severely damaged, and 116,710 slightly damaged, 352 factories wrecked, all communications disorganized and some 6000 miles of highway and virtually the entire railway network disrupted. More than 100 railway stations and 1425 bridges and tunnels were blown up either by the advancing Germans or retreating Allied forces. Brussels, Antwerp, and Liège suffered only minor damage but medium-sized towns like Louvain, Tournai, Nivelles, and Ostend were badly devastated. The Louvain Library, destroyed during the World War and reconstructed with American funds, was again completely wrecked by fire.

A large part of the civil population fled before the German invaders; nearly 2,000,000 crossed into France while other hundreds of thousands obstructed the paths of the contending armies in Flanders, suffering numerous casualties. Civil government had broken down almost everywhere. The Germans sought to bring order out of this chaos as quickly as possible in order to enlist Belgium's economic resources in their total war. They established a Commissar of Reconstruction to restore the communications and transportation systems and to reconstruct and expand industry and agriculture. Substantial progress was reported by the year's end. Despite work on these projects and the recruiting of skilled labor for jobs in the Reich, the number of unemployed was reported at 1,000,000 in September and this total increased as more refugees returned from France.

Food reserves suffered severely during the fighting and the Germans were reported to have appropriated large amounts for shipment to the Reich and to maintain their occupationary forces. The German authorities rationed bread, meat, milk, eggs, and butter at levels 30 per cent below those fixed in Germany. During the winter it was indicated that the food situation was increasingly critical.

The German military administration officially in-

dicated its intention to establish some form of permanent economic union between Belgium and the Reich after the war. The German exchange control system was extended to Belgium June 27. A decree of the same date established the Bank of Issue of Brussels. It issued banknotes in Belgian franc denominations which were legal tender in the occupied territory of Belgium. The commander in chief of the German Army fixed the exchange rate for German and Belgian currency at 10 francs per reichsmark on May 10, 1940, and at 12.50 francs per reichsmark on July 24. The German Ministry of Economic Affairs on September 10 concluded an agreement with the Swedish Government for a compensation trade pact between Sweden and Belgium.

**Other Events.** On July 1 the German Foreign Office requested the United States and other foreign diplomatic missions in Belgium to discontinue their missions by July 15. The Papal Nuncio to Brussels was ordered to leave at the same time. The Belgian Ambassador to Nationalist Spain, representing the government in exile, was invited to leave on October 31 and the embassy at Madrid was closed following the unauthorized departure from Spain for London of Premier Pierlot and Foreign Minister Spaak.

Consult John Cudahy (US Ambassador to Brussels), "Belgium's Leopold," *Life*, Nov. 25, 1940, pp. 75-83; Oliver Benson, "Was Leopold a Traitor?", *Events*, July, 1940, pp. 38-42; Vera Michels Dean, "Europe under Nazi Rule," *Foreign Policy Reports*, Oct. 15, 1940. See CONGO, BELGIAN, under *History*, EUROPEAN WAR, JEWS under *France and the Lowlands*; LABOR CONDITIONS; LEAGUE OF NATIONS; REPARATIONS AND WAR DEBTS.

**BENEFACTIONS.** The assembling of a report in the diverse field of philanthropy is contingent, to an extent at least, on the accidents of publicity. Any total estimate as to the vast sums of money which change hands yearly in the name of charity would be mere guesswork. An indication, however, of trends in the Nation's giving habits is to be obtained from the facts published by the John Price Jones Corporation of New York. This organization compiles reports of publicly announced gifts and bequests, and issues the annual totals for seven large cities in the United States—New York, Chicago, Washington, Philadelphia, Baltimore, Boston, and St. Louis.

Total gifts in these seven cities during 1940 were put at \$61,997,707, as compared with \$83,050,032 in 1939. This appears to indicate a falling-off of charitable activity until it is recalled that the 1939 total was augmented by a single gift of \$25,000,000—that of Samuel H. Kress to the National Gallery of Art. Total bequests in 1940 were \$15,723,127, a decline from the \$22,661,863 reported the previous year.

An analysis of the causes toward which these gifts and bequests were donated reveals, as one might expect, that the year's most noteworthy change was a stepping-up of foreign relief. (See the separate article on WAR RELIEF.) The total in that category was more than \$10,000,000 higher than in 1939. Education appeared to be the loser, having declined from \$30,322,670 in 1939 to \$18,419,898. The gift classifications in order of size were: organized relief, education, foreign relief, health, fine arts, religious purposes, play and recreation, and miscellaneous reform.

**Foundation Activities.** It is apparent that an

increasingly large sum of money earmarked for charitable purposes has been and is being concentrated in the hands of foundations or trusts. During 1940 there was at least one important addition—the 8,000,000-dollar Culpeper Foundation—and the assets of others were augmented by individual gifts (see below), while a number of the long-established foundations continue to operate out of current income with no diminution of capital.

Dr. Frederick P. Keppel, in his 1940 report as president of the Carnegie Corporation of New York, made some interesting comments on the function of this type of organization and its place in the life of the Nation. He stated that, "With rare exceptions, a foundation can reach its objective only by working through another institution, and there are in the United States far more universities, colleges, and other operating institutions, and far more voluntary organizations for worthy purposes than the nation can possibly afford. In the years to come many of these are bound to disappear, and one of the most difficult duties that face the foundation is that of so directing its grants that its influence will be directed toward survival of the fittest."

In this connection, Dr. Keppel welcomed "the growing evidence of what may be called a conservation movement in cultural philanthropy," shown in the co-operative grouping of hitherto competing institutions. Commenting on the conflicting calls made upon foundations in a time of emergency, he admitted the possibility that funds available for educational and scholarly purposes may ultimately be reduced. However, there is as yet, he said, no indication that this will happen.

In reporting on the current activities of the foundations, it is necessary to point out that there are a number of organizations which make no public statement of their work or their finances. E. V. Hollis, in a study of *Philanthropic Foundations and Higher Education* made in 1938 (Columbia University Press), stated that, although he had record of 573 foundations, only 125 supplied data which could be analyzed. Of the capital assets reported to him at that time, almost 90 per cent was controlled by only 20 groups, with 64 per cent accounted for by the Rockefeller and Carnegie trusts.

The following paragraphs summarize briefly the work of some of the more prominent foundations and trusts. The foundations which have the largest financial assets are discussed in separate articles such as CARNEGIE ENDOWMENTS, COMMONWEALTH FUND, GENERAL EDUCATION BOARD, and ROCKEFELLER FOUNDATION.

**Automotive Safety Foundation**, somewhat unusual in that it is supported, not by a permanent fund, but by annual contributions from more than 150 companies in the automotive industry. Organized in 1937 to carry on a broad, integrated highway safety program, the Foundation made grants in 1940 to 15 qualified national organizations for specific activities in the fields of legislation, motor-vehicle administration, enforcement, engineering, education, training of personnel, and research. President: Paul G. Hoffman. Director: Norman Damon. Headquarters: the Tower Building, Washington, D.C.

**Bok Foundation** has as its principal activity the support of the Curtis Institute of Music in Philadelphia. Grants have also been made to the Settlement Music School, Philadelphia, and the Research Studio, Maitland, Fla., the latter being a kind of "laboratory" for painting. Financed by

gifts of \$12,500,000 from Mrs. Mary Louise Curtis Bok, the Foundation was created in 1931 for the support of music, fine arts, science, invention, or general education. Address: 1726 Locust Street, Philadelphia, Pa.

**Buhl Foundation**, established in 1928 by Henry Buhl, Jr., reported that its capital assets were \$12,734,289 in 1940 and that expenditures for the year totaled \$373,007. The Foundation's programs center in the Pittsburgh area, where it has sought to provide more adequate factual bases for social work and regional economic effort, to promote research in public health and the natural sciences, and to develop the community's resources in higher education. Another objective is the advancement of housing standards for American cities, as exemplified in large-scale planned communities administered on a long-term investment basis. In demonstration of this last-named objective, the Foundation operates Chatham Village in Pittsburgh, built in 1932 at a cost of \$1,700,000. The Buhl Planetarium and Institute of Popular Science was built at a cost of \$1,100,000 in 1939 as a gift to the people of Western Pennsylvania. Director: Charles F. Lewis. Offices: the Farmers Bank Building, Pittsburgh, Pa.

**Children's Fund of Michigan** reported expenditures of \$759,735 during the fiscal year ending Apr. 30, 1940, capital assets on that date were \$8,945,776. The Fund was established by James Couzens with a gift of \$10,000,000 in 1929 to promote the health, welfare, happiness, and development of children in Michigan, primarily, and elsewhere in the world. Chief officer: Wm. J. Norton, 660 Frederick Street, Detroit, Mich.

**Cranbrook Foundation**, also devoted to the welfare of the people of Michigan, specifically in the field of education. Established in 1927, it maintains at Bloomfield Hills, Mich., a cultural center including three schools, an Academy of Arts, and an Institute of Science. Expenditures for the year ended June 30, 1940, were \$571,248; capital assets on that date, \$8,144,667. Chairman of the Board of Trustees: George G. Booth.

**Duke Endowment**, created by James B. Duke in 1924, is principally known for its connection with Duke University, but it conducts a number of other activities in the Carolinas as well. The Endowment is a permanent one with a self-perpetuating board of 15 trustees. Except for the \$17,000,000 spent in erecting and equipping Duke University, it is authorized to expend none of its principal. A report covering its first 15 years, ended Dec. 31, 1939, showed that the Endowment had distributed and allocated \$36,939,947 as follows: Duke University, \$18,007,284; hospitals, \$13,013,341; Davidson College, \$974,007; Furman University, \$975,032; Johnson C. Smith University, \$718,269; orphanages, \$1,669,142; superannuated Methodist preachers, \$350,691; rural Methodist churches, \$572,284 for buildings and \$659,892 for operations. These appropriations benefited 160 hospitals, 51 orphanages, and 1667 rural churches. Chairman of the Trustees: George G. Allen. Headquarters: Power Building, Charlotte, N.C.

**Falk Foundation**, created by Maurice and Laura Falk, makes grants to economic research organizations for definitive studies of specific economic problems involved in the development of American industry, trade, and finance. Grants voted in 1940 totaled \$121,800, including two grants to the Brookings Institution for studies of "Public Relief in the United States" (\$42,800) and "Refu-

gee Problems in the Dominican Republic" (\$50,000). Payments made on grants in 1940 totaled \$149,000 and capital assets had a market value of approximately \$5,200,000 as of November 16. The Foundation was established in 1929 with the provision that principal as well as income be used within 35 years. Executive Director: J. Steele Gow. Chairman of the Board of Managers: Leon Falk, Jr. Offices: Farmers Bank Building, Pittsburgh, Pa.

**Guggenheim Foundation**, established by Solomon R. Guggenheim in 1937 for the promotion of non-objective painting, maintains the Museum of Non-objective Painting at 24 East 54th Street, New York City. It also lends travelling exhibitions to schools and museums, and grants a number of scholarships yearly to non-objective painters. Director: Baroness Hilla Rebay. Offices: Carnegie Hall, New York City.

**Juilliard Musical Foundation** was incorporated in New York State in 1920, in accordance with the will of Augustus D. Juilliard, to aid worthy students of music, promote the instruction of the general public in the musical arts, and to encourage a deeper interest in music in the United States. Invested trust funds had a book value of about \$12,000,000 in 1940; only the income is distributed. Secretary: M. Steilen, 31 Nassau Street, New York City.

**Kellogg Foundation**, established by W. K. Kellogg in 1930 to advance the well-being of children without regard to race, creed, or geographical boundary, expended \$1,337,101 during the year ending Aug. 31, 1940. Total capital assets on that date were \$47,319,003. The Foundation has undertaken and is administering the Michigan Community Health Project, a model program involving seven counties in southwestern Michigan (See DENTISTRY). The present program includes also national and international health promotion activities and the granting of fellowships. President: George B. Darling. General Director: Emory W. Morris. Headquarters: Battle Creek, Mich.

**Macy Foundation**, established by Mrs. Walter Graeme Ladd in 1930 in honor of Josiah Macy, Jr., reported total expenditures for the year ending Dec. 31, 1940, at \$206,312; total grants paid, \$148,922. Drafts are not permitted upon the endowment, which has a ledger value of \$6,216,852. Emphasis is placed on special problems in medicine which require for their solution studies and efforts in correlated fields as well, such as biology and the social sciences. President: Ludwig Kast. Headquarters: 565 Park Avenue, New York City.

**Markle Foundation, John and Mary R.**, established in 1927 by John Markle, has limited its new activities to grants in aid of specific research projects in medical sciences. Appropriations made in 1939 amounted to \$808,015, while grants paid and operating expenditures were \$596,705. There were in progress during the year 126 separate projects receiving aid. The year-end market value of the principal account was \$16,632,968. President: J. P. Morgan. Secretary: Florence E. Quick. Offices: 14 Wall Street, New York City.

**Milbank Memorial Fund**, established in 1905, had expended a total of \$11,550,093 up to the end of 1939. Appropriations for grants and projects in that year totaled \$225,846. The Fund assists agencies and institutions in the field of public health and medicine, education, social welfare, and research. Emphasis is given to activities which are preventive rather than palliative, and to the im-

provement of administrative procedures in public health. In 1939, 31 organizations received funds, including Barnard College, \$100,000, Community Service Society of New York, \$20,000, Judson Health Center, \$25,000, and Neighborhood Health Development, Inc., \$26,000. President: Albert G. Milbank. Executive Director: Fran G. Boudreay, M.D. Offices: 40 Wall Street, New York City.

**Permanent Charity Fund** was established in 1915 by the Boston Safe Deposit and Trust Company to furnish a medium through which money may be left in trust to charity. The principal of the Fund is invested and the income distributed to existing organizations, usually of Boston and vicinity. Payments to charities during the fiscal year ended June 30, 1940, totaled \$176,159 and capital assets on that date were \$5,479,092. President: Charles E. Mason. Offices: 100 Franklin Street, Boston, Mass.

**Rackham Fund**, established by Horace H. and Mary A. Rackham, was in process of closing in 1940 after seven years of activity during which grants were made to existing organizations, usually in Michigan, for educational, scientific, and charitable purposes. Total cash funds available were \$14,215,413, of which \$109,925 remained unspent on Sept. 30, 1940. The Fund's disbursements were in the fields of child welfare and character building, development of community life, education, health and hospitals, benevolence, religion and public purposes, and science. Grants to the University of Michigan included \$1,500,000 to develop engineering, \$6,603,500 for the Horace H. Rackham School of Graduate Studies, \$600,000 to create an Institute for Human Adjustment, \$505,000 for a Sociological Research Unit, \$100,000 for undergraduate scholarships, \$1,000,000 for arthritis research and a clinic. Other major gifts went to the Boys' Club of Detroit, Franklin Settlement in Detroit, The Community Center at Fenton, Mich., Michigan State Normal College for a School of Special Education, Arnold Home for Aged and Incurables in Detroit, Detroit Community Fund, and to Michigan State College for research in chemical use of agricultural products.

**Reynolds Foundation, Inc.**, established in 1936 for charitable and civic purposes in the State of North Carolina by Zachary Smith Reynolds, has undertaken as its first project a campaign to control venereal disease in the State. An annual grant, amounting in 1940 to \$200,000, is made to the State Health Department for this purpose. The principal of the trust had a market value of \$5,805,673 on Nov. 1, 1940. President: Richard J. Reynolds, Winston-Salem, N.C.

**Rosenwald Fund**, incorporated by Julius Rosenwald in 1917 "for the well-being of mankind," conducts its activities chiefly among Negroes and in the rural South. Capital assets on June 30, 1940, were valued at approximately \$4,500,000. The present program includes the following: (1) Rural education, especially in the south, for which \$292,642 was spent during the two-year period ending June 30, 1940; \$437,000 has been appropriated for continuing the work. (2) Fellowships for advanced study for Negroes and white Southerners, for which \$100,000 a year is set aside. 96 individuals received new grants and 68 received renewed grants during the past two years. (3) Aid to important Negro universities, which is concentrated in four major centers—Howard, Atlanta, Fisk, and Dillard Universities; support was extended also to Talladega College for the first time in 1940. (4) The

improvement of Negro health and race relations. President: Edwin R. Embree. Offices: 4901 Ellis Avenue, Chicago, Ill.

**Russell Sage Foundation**, established in 1907, has an endowment of \$15,000,000 to be used for the improvement of social and living conditions in the United States. While the foundation is not primarily a contributing organization, it does make grants of about 30 per cent of its income to agencies with similar purposes. Among the types of activity carried on are adult education, city and regional research and planning, improvement of housing, family welfare, training for social work, community social work programs, child welfare, placement and vocational service, leisure-time activities, legal aid, penology and prevention of delinquency, service to travelers and transients, publications, organization of social workers, improvement of race relations, research, and social phases of the arts. Information obtained is given out through publications, lectures, addresses, courses of instruction, conferences, and correspondence. The Foundation's conference rooms and halls are used each year by approximately 100 different groups for about 500 meetings. President: Lawson Purdy. Offices: 130 East 22 Street, New York City.

**Sloan Foundation**, incorporated by Alfred P. Sloan in 1936, aids accredited schools and colleges in developing new "patterns" in economic education. On Nov. 30, 1940, its capital assets were valued at \$5,321,313. Up to the same date, the Foundation had made grants amounting to \$1,115,514. At present the Foundation is enabling colleges and universities to promote economic literacy through varied media, including radio, motion pictures, the printed word, fellowships, and class instruction. Among such projects aided by the Foundation are: University of Chicago Round Table of the Air, a weekly radio discussion of economic phases of national and international questions; the Educational Film Institute of New York University, which produces and distributes sound motion pictures on economic subjects; and the Public Affairs pamphlets, containing popular digests of current economic researches, issued continuously by the Public Affairs Committee of New York. Other beneficiaries include the Tax Institute of the Wharton School of Finance and Commerce at the University of Pennsylvania and the national Institute for Consumer Education (q.v.). Moreover, both at the Massachusetts Institute of Technology and at the University of Denver, the Foundation maintains a special group of ten fellowships offered to college graduates in national competition. At M.I.T. these are awarded to young industrial executives for a year's study of social and economic conditions. At Denver the fellowships provide training for a new profession—appraiser of local government—through an 18-month course in taxation and public expenditures. Entering the field of applied economics, the Foundation in 1940 enabled the State universities of Kentucky and Florida to start experiments designed to aid low-income groups. The experiments aim to discover whether solely through instructing school children in simple, inexpensive ways of improved diet and housing, the community level of living can be raised. Director: Harold S. Sloan. Offices: 30 Rockefeller Plaza, New York City.

**Spelman Fund** of New York, incorporated in 1928 with a principal fund of \$10,000,000. During 1940, the Fund continued its program directed at the improvement of methods and techniques in the

field of public administration. Support was extended to public and quasi-public agencies engaged in disseminating information regarding advances in administrative practice, in developing new types of organization and operating methods, and in actually installing administrative improvements in governmental agencies. The Fund appropriated \$431,000 during the year. Chairman of the Board of Trustees: Charles E. Merriam. Executive: Guy Moffett. Offices: 49 West 49 Street, New York City.

**Warm Springs Foundation**, a membership corporation, conducts a modern and scientifically equipped institution at Warm Springs, Ga., with a capacity of 100 beds, for the study and treatment of the after-effects of poliomyelitis (infantile paralysis). The Foundation is the only institution devoting its energies entirely to infantile paralysis. It seeks to improve and perfect methods of treatment and make the knowledge gained thereby available to the medical profession and the public. Through completion of a new medical building with complete hospital facilities, the Foundation was able in 1940, for the first time, to care for patients in a single building and study every phase of treatment. President Franklin D. Roosevelt. Chairman of the Executive Committee: Basil O'Connor. Address: 120 Broadway, New York City.

**Individual Gifts and Bequests.** The following list names, in order of magnitude, the beneficiaries, during 1940, of individual gifts and bequests amounting to a half-million dollars or more. The information is derived from *Giving Today*, a quarterly report issued by the John Price Jones Corporation.

National Gallery of Art, Washington, D.C.: Gift of an art collection estimated at \$12,000,000 to \$50,000,000 in value, from Joseph E. Widener, Elkins Park, Pa.

Charles E. Culpeper Foundation: A bequest of \$8,000,000 to establish a foundation devoted to charity, education, and religion, from Charles E. Culpeper, Norwalk, Conn. Kresge Foundation: Gift of \$7,650,000 in stock from S. S. Kresge, Detroit, Mich.

Joslyn Art Memorial: Bequest of \$2,500,000 made by Mrs. Sarah H. Joslyn of Omaha, Neb., bringing her gifts to the Memorial to a total of \$7,000,000.

Morton Memorial Hospital, Northwestern University: Bequest of \$2,000,000 in the will of Mrs. Margaret Gray Morton, Chicago, Ill.

Vanderbilt Mansion, Hyde Park, N.Y.: Gift to the nation of a mansion valued at \$2,000,000 as a national historic museum, from Mrs. Margaret Louise Van Alen of Newport, R.I.

Wesley Memorial Hospital, Northwestern University: Gift of 20,000 shares of the Inland Steel Company, valued at \$1,660,000, for the construction of a 20-story hospital, from George H. Jones, Chicago, Ill.

David P. Wohl Foundation: A gift reported (though not officially stated) to total \$1,000,000 to establish a foundation for the benefit of charitable and educational projects, from David P. Wohl, St. Louis, Mo.

Fowler Memorial, St. Louis, Mo.: Bequest of \$1,000,000 for the construction of a hospital, from the will of Mrs. Cora Liggett Fowler in memory of her husband.

John Bulow Campbell Trust Fund: A bequest of \$1,000,000 for the promotion of religious, educational, and health projects in Atlanta, Ga.

Mount Joy, Pa.: Gift to the community of an oil company valued at \$1,000,000, from Clarence Schock.

Samuel H. Kress Foundation: Gift of 82,303 shares of stock valued at \$1,000,000 from Samuel H. Kress of New York.

University of Chicago: Gift of Chicago Loop property valued at \$1,000,000 from Marshall Field, Ill.

New York Community Trust: Bequest of \$900,000 to establish (if practicable) restaurants in which needy persons may be fed free or for a nominal charge, from Wilhelm Loewenstein of New York.

Hofstra College Endowment fund of \$700,000 from the estate of Mr. and Mrs. William S. Hofstra, Hempstead, L.I.

Harvard College: Bequest of \$642,169 from Julia Isham Taylor, New York, N.Y.

Northwestern University: Bequest of \$635,000 from John S. Appleman, Chicago, Ill.

Memorial Hospital, Worcester, Mass.: Bequest estimated at \$600,000 from the estate of Mrs. Mary G. Ellis, Worcester, Mass.

Massachusetts General Hospital and Pennsylvania Hospital of Philadelphia: Bequests of \$583,333 each from the estate of Rev. Alexander Gardner Mercer of Newport, R.I., who died in 1885 (Distribution of the estate was delayed until the death of 80 annuity recipients.)

Worcester Art Museum: Bequest of a half-million dollar art collection and \$25,000 from Mrs. Mary Griffin Ellis, Worcester, Mass.

Greenwich (Conn.) Hospital: Anonymous gift of \$500,000 contingent on the Hospital's raising an additional \$750,000 for a new building.

Jefferson Medical College Hospital: Bequest of \$500,000 for tuberculosis and cancer research and treatment, from Mrs. Emily Barton Pendleton, Atlantic City, N.J.

Pennsylvania College for Women: Gift of a home and seven acres of ground valued at \$500,000 from Paul Mellon as a memorial to his father, Andrew Mellon.

West Palm Beach, Fla.: Gift of \$500,000 to build an art gallery and school, from Mr. and Mrs. Ralph Norton of Illinois.

**Fund-Raising Campaigns.** Aside from the intensified drives for war relief (q.v.), one of the most publicized fund-raising campaigns of the year was that conducted by the Metropolitan Opera Association of New York with the object of gaining ownership of the Metropolitan Opera House and initiating a new and enlarged program as a center of musical activity. The Association directed its campaign in large part to its radio audience, emphasizing for the first time the importance of small donations. The result was, not only achievement of the million-dollar goal early in May, but an increased interest in opera on the part of a wider public. Other musical organizations seeking to solve their financial problems through public subscription were the Chicago Symphony Orchestra, which raised \$137,364 toward liquidation of its deficit, and the National Symphony Orchestra which set a goal of \$107,600 for its campaign. See also *MUSIC*.

Outstanding in the educational field was the raising of \$5,000,000 in gifts and pledges to establish a University Center in Atlanta, Ga. The success of the campaign secured a conditional grant of \$2,500,000 from the General Education Board toward the project, which will involve the co-ordination and development of six Georgia institutions. The Bicentennial Planning Committee of the University of Pennsylvania announced that it had raised \$5,035,000 on September 20. The President's Program of Princeton University reached \$3,311,084 (February 22), and the 75th Anniversary Fund of Vassar College \$1,933,429 (June 8). The Catholic University of America also had under way a nationwide drive. An unusual tribute—in that it honored a man still living—was the collection of \$100,000 among the friends of Carter Glass to establish the Carter Glass chair of government at Sweet Briar College.

The Presbyterian Board of Christian Education conducted a sesquicentennial fund drive for \$10,000,000 during the year; \$8,167,944 had been collected by September 22. A special thank offering of \$974,089 from Episcopal women was announced at the convention of the Protestant Episcopal Church, October 11; the money was to be used for foreign and domestic missions. Of increasing interest in the field of health is the annual campaign to combat infantile paralysis, the Committee for the Celebration of the President's Birthday, which co-ordinates this drive, reported \$1,407,245 raised in 1940. The usual number of drives for enlarging or renewing hospital facilities went forward.

There are, of course, many organizations and institutions, whose regular program includes the

collection of gifts for various purposes. For their current reports the reader is referred to such articles as AMERICAN LEGION, COMMUNITY CHESTS AND COUNCILS, COMMUNITY TRUSTS, RED CROSS, the report on gifts tabulated under UNIVERSITIES AND COLLEGES, the articles on religious organizations, and the list of SOCIETIES AND ASSOCIATIONS. See also ART under *Museums*; LIBRARY PROGRESS under *Gifts, Grants, and Buildings*.

**BEQUESTS.** See **BENEFACCTIONS**

**BERMUDA.** An insular British colony, 677 miles southeast of New York. Included in its area are some 360 islands, of which 20 are inhabited. Area, 19.3 square miles; civil population (Mar. 26, 1939, census), 30,814 (11,481 white, 19,333 colored). Chief towns - Hamilton, the capital, 3259 inhabitants; St. George, 1000. During 1938 there were 769 births and 332 deaths. Bermuda is an important British naval base.

**Production and Trade.** There are about 1000 acres of farming land under arable cultivation and most of it bears from two to three crops a year. The chief crops are potatoes, onions, lily bulbs, cut flowers, and green vegetables. Bananas and arrowroot are grown. During the first eight months of 1939 over 65,000 tourists visited the islands. Trade (1938) - imports, £1,906,689, exports, £145,943. Bermuda is linked to New York by air service and is a port of call on the New York to Lisbon transatlantic air route. Shipping aggregating 6,441,284 tons entered and cleared during 1938.

**Government.** For 1939 revenue was estimated at £430,423 and expenditure at £433,866. The public debt on Dec. 31, 1938, totaled £75,000. A governor, aided by an executive council, administers the colony. There is a legislative council of 9 members (3 official and 6 nominated unofficial) and an elected house of assembly of 36 members (4 from each of the 9 parishes). Governor and Commander-in-Chief, Maj.-Gen. Sir Denis Bernard (appointed Apr. 6, 1939).

**History.** In notes exchanged Sept. 2, 1940, the British Government agreed to lease to the United States for 99 years sites for naval and air bases in Bermuda. After surveys by United States experts, the sites agreed upon were announced in Washington November 18, as follows:

(a) For land-plane base Long Bird Island—enlarged by dredged fill to accommodate main runway along its major axis and two cross runways nearly on the end, together with certain of the land north and east of Ruth's Bay and south of the main road leading to Stokes Point.

(b) For seaplane base, naval base and garrison area. That part of St. David's Island from Stokes Point to Riggs Bay, together with portion lying south of the main road and south and west of the road leading to Ruth's Bay and including Ruth's Point and promontory, and in addition certain small islands lying close off the southern shore of St. David's Island.

(c) For explosive storages. The small islands between St. David's and Hamilton Island along the eastern entrance to Castle Harbor (Cooper's, Nonsuch, Brangman's, Charles, and Castle Islands).

(d) In order to prepare Castle Harbor for use. The United States authorities to have the right to substitute a drawbridge (for relocated highway and railway) between St. George's Island and Coney Island to render this entrance to Castle Harbor usable for vessels and seaplanes. The United States authorities also to have the right to make such alterations to the southwest causeway to Long Bird Island as may be necessary, and to do such other dredging and filling in Castle Harbor as may be required for the base.

(e) The question of the granting of facilities affecting an island or islands in the Great Sound for operation of seaplanes is still under consideration.

Even before the approval of these base sites by the Bermuda House of Assembly on Novem-

ber 27, United States naval planes began operations from Bermuda in connection with the neutrality patrol of the inter-American security zone.

The issue of leasing the base sites was first submitted to the House of Assembly in secret sessions held August 19 and 20. On August 24 the Governor of Bermuda announced the local government's decision to approve the proposal. In a memorial to the British Government adopted August 20, the Assembly expressed deep concern "lest some new conception of American hemisphere defense may affect the status of this ancient Colony as an integral part of the British Commonwealth." The memorial urged that "nothing be allowed to prejudice our Constitution, our Government or our complete happiness and contentment under British rule." The British Secretary of State for Colonies replied that there was no question of Bermuda, or any part of it, being separated from the British Empire, or of the people of Bermuda ceasing to be British subjects.

On September 2 the Assembly voted to ask the Governor to protect the islands' peacetime pursuits in determining the base sites. An official committee of six represented the local government in the subsequent negotiations. It strenuously objected to the original proposals of the United States board of inspection on the ground that they would "give rise to gravest economic, social and political dislocation of the life of the colony." Following the Governor's announcement of the sites on November 18, the Assembly after considerable debate approved the Governor's message with an amendment urging that title to private property taken over for the bases vest in the Bermuda Government, subject to lease to the United States. The size of the base area, and the announcement that a garrison of at least 4500 troops would be sent to guard it, caused apprehension as to the long-term consequences of the lease.

Bermuda's loyalty to the mother country was shown by various acts during the year. In addition to four volunteer defense units maintained by the Bermuda Government, the Assembly voted on June 24 to conscript men for service in a Bermuda Defense Corps. On September 18 the Governor under the British Orders in Council assumed power to command the services of persons and property for defense purposes. On May 29 the Assembly approved an immediate war contribution to the British Government of £40,000 and at the end of November this was raised to £200,000. Direct taxation was imposed for the first time to meet a marked shrinkage in revenues.

The colony became a highly important cog in the British convoy and blockade systems. Murray's Anchorage served as a concentration point for convoys bound for Britain and various other destinations, beginning in May, 1940. Before the end of the year a staff of over 700 censors was reported at work in Hamilton examining mails carried on vessels and airplanes touching the island en route to or from European ports. The United States consul at Hamilton formally protested when the censorship of U.S. airmails began on January 18. After March 15 some of the Pan American transatlantic planes omitted the stop at Bermuda. Effective July 8 passport visas were required of all persons not British subjects landing on the island and all persons over 16 years of age living in Bermuda were required to carry identification cards.

**BESSARABIA.** See RUMANIA and UNION OF SOVIET SOCIALIST REPUBLICS under *History*.

**BILLIARDS.** Willie Hoppe was once again the leading figure in the world of billiards, a position he has frequently occupied throughout the last 34 years. At 52 he won the three-cushion billiard championship without sustaining a defeat. In doing so, he defeated ten of the leading players in the world, and won 20 straight games, an unprecedented achievement in the history of three-cushion billiards. He was named the No. 1 player of 1940 by the National Billiard Association.

Hoppe averaged 1.161 points an inning over the 20-game route, a mark which shattered Cochran's former record of 1.123 set in 1935. Five former title holders faced him. His nearest competitors, in order, were Jake Schaefer, Jay Bozeman, and Welker Cochran.

The world's pocket billiard championship was won by Andrew Ponzi of New York who defeated Jimmy Caras of Wilmington, Del. He broke the world's record high-run of 126, exceeding that mark by one point.

**BILLITON.** See NETHERLANDS INDIES under *Area and Population*.

**BIOLOGICAL CHEMISTRY.** Because of the war and other unsettled conditions the year has witnessed an appreciable slackening of the pace of publication of important experimental data. However, some very important developments have been made, and this is especially true in the field of the vitamins.

R. J. Williams and his co-workers have solved the major structural problems connected with the chick antidermatitis vitamin, pantothenic acid. Evidence for the complete structure of this powerful member of the vitamin B family has been published. In collaboration with these investigators its total synthesis also has been realized in the Research Laboratories of Merck and Co. Inc., Rahway, New Jersey. Its biological activity has also been investigated. In carrying out these latter studies György and Poling reported results which strongly indicate that pantothenic acid has a curative effect on nutritional achromotrichia (depigmentation of the hair, also called "graying") of rats. Their results, however, are in conflict with observations made by Williams. In the latter case pure pantothenic acid exhibited no preventive or curative effect on gray hair, although it was observed that the rate of growth and the length of life were greatly enhanced. It is to be noted in this connection, however, that the diet in the two sets of experiments was somewhat different. Williams substituted 8 per cent butter for 2 per cent corn oil. This would seem to suggest that another factor has to be taken into consideration, an idea first suggested by Nielsen et alii. It should also be recorded at this time that certain derivatives, such as hydroxy pantothenic acid, have been synthesized. They also possess striking biological activity. It has been observed, however, that the effectiveness of all these compounds varies with different microorganisms and also the testing conditions. Certain microorganisms such as *Lactobacillus Helveticus* cannot grow without pantothenic acid. Herein, in some such manner, may rest its value in human nutrition.

Other important experimental data in the field of the vitamins have been published. Although several laboratories have reported neurological lesions as a consequence of vitamin A deficiency the relation of vitamin A to growth and function of

the nervous system has remained unsolved. Experiments by Wolback and Bessey at the Harvard Medical School indicate, however, that the explanation of these lesions occurring in this deficiency lies in a relative over-growth of the central nervous system. This results in mechanical damage and degeneration of the nerve fibers. The earliest and most striking manifestations are in the spinal canal and appear to involve both anterior and posterior nerve roots.

During the past year the concept of isosterism, as proposed by Grimm and extended by Erlenmeyer, has attracted attention by its possible application with respect to the substitution of a pyridine nucleus for the thiazole component of the vitamin B<sub>1</sub> molecule. With these views in mind several investigators have attempted the synthesis of the true isoster of thiamin (B<sub>1</sub>) in order, if possible, further to correlate structure and physiological activity. This has finally been successfully accomplished by Elderfield and Tracey at Columbia University. Starting with ethyl  $\alpha$ -( $\beta$ -ethoxyethyl)- $\beta$  aminocrotonate these investigators prepared 2-methyl-3-( $\beta$ -hydroxyethyl)-pyridine. This compound was then condensed with 2-methyl-5-bromomethyl-6-amino pyrimidine hydrobromide to give the true pyridine analog of thiamin. Its physiological properties are being investigated and the results when published will be of interest both theoretically and practically.

Work on another member of the vitamin B family continued to be of absorbing interest. Dr Sebreel of the National Institute of Health has continued his studies on pellagra, and has found that keratitis, a disease which affects the outer transparent coating of the cornea, is in reality a deficiency disease, and is caused by a lack of riboflavin. Thus it is not due to syphilis as previously supposed. He was led to this discovery by the observation that keratitis is often found in sufferers from pellagra who are not entirely cured by nicotinic acid.

Last year this reviewer reported on the synthesis of vitamin B<sub>6</sub> in the Research Laboratories of Merck and Co. During the past twelve months these same laboratories have released for publication other interesting facts on the chemistry of this highly interesting compound. This molecule has been found to exist in tautomeric forms. Evidence as to the nature of this tautomerism has been obtained by the comparison of the absorption spectra and ionization constants of the vitamin with those of vitamin B<sub>6</sub> methiodide, N-methyl vitamin B<sub>6</sub>, betaine, and related compounds. Their results show the presence of three tautomeric modifications, all in equilibrium. These forms are assumed to represent the successive stages of acidic ionization of the vitamin B<sub>6</sub> hydrochloride. It is of further interest to note that when methylation of the nitrogen atom in one form of the B<sub>6</sub> molecule takes place all biological activity is destroyed.

The research chemists of Merck and Company have also reported the formation of a vitamin B<sub>6</sub> borate complex. This observation was made in the course of the development of a colorimetric method for the determination of vitamin B<sub>6</sub>. Boric acid with a co-ordination number of 4 is linked to two molecules of the vitamin through the oxygen atoms in the 3 and 4 positions. This complex is of further interest in that it is thermostable in neutral solution and has the physiological activity of vitamin B<sub>6</sub> itself. It may be inferred, therefore, that the complex in the animal organisms is com-

pletely broken down to liberate the unchanged vitamin.

Vitamin E, the compound known as the fertility vitamin from wheat germ, is being hailed in certain medical circles as a cure for the hitherto hopeless diseases of muscle weakness and nerve degeneration. Striking results are reported by Dr. Franklin Bicknell and by Dr. Ira Wechsler. According to Dr. Bicknell this vitamin can also be used to protect children against infantile paralysis. He is of the belief that when it is so used, the nerve and brain cells are more resistant to attack by the paralysis virus. The vitamin has been used for muscular dystrophy, amyotrophic lateral sclerosis, peroneal muscular atrophy, and amyotonia congenita. Results of treatment in the muscle weakness conditions were remarkable, every patient except one showing improvement. In concluding his paper Dr. Bicknell suggests, however, that the substance in wheat germ which produces this improvement may be something other than the chemical,  $\alpha$ -tocopherol, which has been identified as the pure form of the anti-sterility vitamin. For this reason he used dried whole wheat germ and not the pure chemical itself.

The announcement of a new vitamin has been made. According to C. A. Elvehjem and his co-workers there is present in milk a compound which prevents stomach ulcers in guinea pigs. Milk is the best source of this vitamin, which is interesting in that sufferers from stomach ulcers are usually fed a diet of milk and cream. Its purification and structure are yet to be realized.

V. du Vigneaud, P. Gyorgy, and co-workers have called attention to the possible identity of vitamin H, the curative factor for egg-white injury, with biotin, a growth factor for yeast, and with co-enzyme R, which is a growth and respiration factor for many strains of legume nodule bacteria. The identity of biotin and co-enzyme R has been indicated previously by West and Wilson. From the standpoint of chemical and physical properties the similarity in the nature of these compounds is marked. All these substances are dialyzable, heat stable, and resistant to treatment with acid and alkali. None is precipitated with lead acetate. Treatment of vitamin H or biotin with benzyl chloride in pyridine results in an inactive product. Nitrous acid produces inactivation, acetylation also causes inactivity. The highest purity vitamin H is extremely potent in co-enzyme R activity. In conclusion these investigators report that a crystalline preparation of biotin methyl ester possesses vitamin H activity to a high degree. When purified to a constant melting point and activity it possesses such an extremely potent vitamin H activity as to leave no doubt that vitamin H and biotin are one and the same compound.

Advances continue to be made in the field of the sterols and hormones. The isolation in pure form of the interstitial cell-stimulating (luteinizing) hormone of the anterior lobe of the pituitary gland has been reported by investigators of the Rockefeller Institute for Medical Research of New York and of the Squibb Institute for Medical Research at New Brunswick, N. J. This protein hormone, isolated from swine pituitary glands, has a molecular weight of about 90,000. Its isoelectric point is pH 7.45. It was shown to be pure by tests in the electrophoretic apparatus of Tiselius and in the ultracentrifuge. The hormone so obtained was found to stimulate the interstitial tissue of the testis or ovary, and caused the formation of corpus lutea

provided that maturing follicles were present. Extracts of swine pituitary with purely follicle-stimulating effects did not cause oestrus in immature hypophysectomized female rats unless luteinizing hormone was also administered.

R. I. Dorfman of the Yale University School of Medicine has reported that he has obtained evidence of a new estrogenic substance present in the neutral fraction of human pregnancy urine. From his experiments it appears that in addition to the well-defined phenolic estrogens in human pregnancy urine there appears to be another estrogenic substance which is a neutral non-ketonic compound.

Fernholz and his co-workers have determined beyond reasonable doubt the structure of two sterols, brassicasterol and spinasterol. Marker and his students have continued their studies on the sapogenins. Among the more interesting results which have been obtained may be mentioned the following: (a) they have observed that under suitable conditions pseudo-sarsasapogenin, pseudo-tigogenin, and pseudo-chlorogenin are isomerized by hydrochloric acid to the original sapogenins; (b) they have shown that allopreganediols can be obtained from tigogenin. Sarsasapogenin and diosgenin can be converted into testosterone and related compounds; (c) the structure of pseudo-sarsasapogenin has been further elucidated. Evidence has also been submitted which indicates that the hydroxyl groups in chlorogenin are in the 3-beta and 6-alpha positions; (d) they have also shown that the supposed sapogen, trillagenin, is in reality a mixture of diosgenin and trillin.

Wallis and his students have also continued their studies in the field of the sterols and hormones. From their experiments a new route has been suggested for the preparation of sterols having an hydroxyl group at  $C_{11}$ . This is of practical importance because of the position of the hydroxyl group at the  $C_{11}$  position in the adrenal cortex hormone cortin. These investigators have also published a new and simple method for the synthesis of hexoestrol, a synthetic sex hormone of high potency. Because of this new method this substance can now be prepared at a much cheaper cost.

In 1938 this reviewer reported through the discovery of the utilization of sulfanilamide a new era in medicine—the era of chemotherapy of bacterial diseases. Again this year the work has consisted mainly in the preparation of derivatives of this compound and in the investigation of their physiological activity. Although there is no complete record of all the sulfanilamide derivatives which have been made it is conservative to state that they now exceed three thousand. Experiments show, however, that only a few are valuable: namely, sulfanilamide itself, sulfapyridine, and sulfathiazole. Much work has been done during the year in an attempt to find out the significant property necessary for this activity. But just how the potent ones act, why they act, and on what they act are not yet established. At present it may be said only that they retard the growth of bacteria. The results obtained with this treatment, however, are often dramatic. Diseases such as erysipelas, scarlet fever, tonsillitis, mastoiditis, meningitis, peritonitis, septicemia, pneumonia, gonorrhea, respond to this treatment. Although the streptococcus haemolyticus is affected, streptococcus viridans seems to be immune and as a result there is at present no cure for this infection. Evidence has also appeared during the year which indicates that some of the sulfanilamides are effective in the treatment of tubercu-

losis, at least in guinea pigs. They are also effective to some extent in gas gangrene, trachoma, undulant fever, and lymphopathia venereum. Before concluding this subject it would seem appropriate to mention a few specific compounds which have become of interest because of their potency in combatting infections of various types. 4,4'-Diamino-diphenyl sulfone is effective in many infections in mice. Sulfathiazole has been found to be a particularly valuable drug in the treatment of gonorrheal urethritis in the male. Certain heterocyclic derivatives such as sulfamyl-2-pyridylamide and 2,4-methyl thiazylamide have curative action. Sulfamyl guanidine also has been found to be a good agent especially for certain intestinal infections.

It is possible to report progress in the chemotherapeutic treatment of certain parasitic diseases. Malaria will serve as an example. Here the most promising results have been obtained with quinoline and acridine derivatives. While none is the ideal drug, those of the type of plasmoquine, rhodoquine, and atabrin are certainly valuable aids to quinine. Here again, however, the great obstacle to progress is the lack of knowledge of the mechanism by means of which the drug acts and what properties it should have to be effective.

Progress has been made during the year in certain other fields of investigation. Adams and his students have continued their studies on marihuana, that part of the hemp plant, or extract therefrom which induces somatic and psychic changes in man. Their researches on one of the components of the "red oil," cannabinal, have led to a clearer picture of its structure. They have shown that the hydroxyl group and *n*-amyl group occupy different positions from those first suggested by Cahn. Their formula, which represents cannabinal as 1-methyl 3-*n*-amyl-6,6,9-trimethyl-6-dibenzopyran, has been demonstrated to be correct by synthesis. They have also isolated another compound cannabidiol and work on its structure has been carried out. Like cannabinal it is also physiologically inactive. When cannabidiol is isomerized with various acidic reagents it produces two forms of a new compound tetrahydrocannabinal. The evidence is that their structures differ mainly in the location of the double bond. The lower rotating form has high activity; the higher rotating form is less active. Both can be hydrogenated to give a single hexahydrocannabinal which is also physiologically active. Recently Todd has isolated another compound from "red oil" which he has named cannibol. There is as yet, however, no information regarding its chemical and physiological properties.

A protein-digesting enzyme resembling pepsin in its action has been found in the weed known as horse nettle. Experiments show that it is even more like the digestive agent found in papaya, and called papain. Because of the weed's name, *solanum*, this newly discovered substance is called solanain. Since papain has been used in medicine it is possible that this enzyme may also be of value. It is also to be noted that it may find an economic use in tanning, etc.

A complex vaccine effective against different strains of influenza virus has been produced by Dr. F. L. Horsfall, Jr. and Dr. E. H. Lennette of the Laboratories of the International Health Division, The Rockefeller Foundation, New York. By means of their experiments it has been possible to prepare vaccines capable of producing active immunity in ferrets against the influenza virus.

Ferrets which were given these vaccines and subsequently inoculated with 1000 infectious doses of heterologous strains of influenza virus showed neither the typical signs of infection nor increase in neutralizing antibodies, indicating conclusively that no infection by the virus had occurred. This vaccine was also tested on small groups of humans. It was found that a vaccine prepared from the tissues of ferrets suffering from "concurrent infections with influenza virus and the strain of distemper virus isolated from spontaneously infected ferrets" produced a definite increase in antibodies neutralizing influenza virus in every case. These investigators are now conducting experiments to determine the duration of the immunity in man produced by this complex vaccine.

From a statement of Dr. Mary Collier of the Mission Station in Nan Siam, published in *Science*, scientists have gained the information that in the use of diphtheria toxoid and antitoxin there is a treatment for leprosy which far exceeds any method yet known. Startling results are obtained. It was known previously that the leprosy bacillus damaged greatly the adrenal glands and that this injury was the more immediate cause of trouble. It is also known that diphtheria liberates a toxin which damages the adrenal glands. Thus, it occurred to Dr. Collier that the use of the antitoxin and toxoid might be beneficial. The results to date are so favorable that it is hoped to immunize the children and associates of lepers and so in time to eradicate the disease.

At last it is possible to report on the therapeutic effectiveness of certain new compounds in arthritis. Early in 1939 Dr. A. B. Sabin reported that by intravenous injection of a newly discovered pleuropneumonia-like microorganism it was possible to produce an experimental chronic arthritis in mice which bears a close resemblance to human arthritis. Continuing these experiments this investigator now reports that a practically non-toxic new gold compound, calcium aurothiomalate, has been prepared which has high therapeutic effectiveness in combatting this disease. It is interesting that this substance is approximately ten times more effective therapeutically than is calcium aurothioglycollate. Although at present the investigations have been carried out only on mice it is hoped that shortly other types of mammals may be studied.

It has also been reported by Boyd and his co-workers that treatment of arthritis with acetyl-beta-methylcholine chloride is giving encouraging results. Thirty-five cases of arthritis have been so treated. Ten of sixteen patients whose hands were treated showed an increased flexibility in function and usefulness. Pain was reduced in some patients. Muscular fatigue was markedly relieved in almost all cases adequately treated. Increased endurance was experienced by those completing a full course of treatment. Maximum effects were obtained after a course of eighteen to twenty treatments. Circulatory changes were graphically demonstrated. Patients with circulatory disturbances of the extremities—those with cool, pale, moist, and often cyanotic hands and feet—gained most from the treatment.

To this reviewer progress during the past twelve months in cancer research is more promising than formerly. Early in the year Dr. John F. Menke of Stanford University announced that he had succeeded in preparing from certain cancers of human origin an extract which when injected into mice produced tumors. This is the first time in medical

history that a substance from human cancer has been incontestably transmitted to an animal. Recently, in *Science*, Dr. P. E. Steiner of the University of Chicago has reported that from unaffected livers of persons who have died from cancer he has prepared an extract which produces cancer in mice. This work, it can be seen, goes further in that it shows that in an unaffected organ of the body there is stored up a substance which is carcinogenic in its nature. Although sufficient time has not elapsed to permit a final conclusion, to date a similar extract from the livers of non-cancer bearing persons has not induced tumors. Dr. Steiner reports that experiments are in progress on the chemical separation, on the relation to the type of cancer produced, on the distribution within the body, and on the origin of this most highly interesting compound.

A few developments have been made with the new electron microscope. A conservative estimate based on the examination of pictures taken with this instrument makes the resolving power 20 times that of the best light microscope. As is well known this instrument uses electricity instead of light and magnetic fields instead of lenses. In a lecture by Dr. T. F. Anderson given in the Frick Chemical Laboratory of Princeton University new facts about viruses to the diphtheria bacillus were described which are of great interest. For example, since 1900 it has been known that the diphtheria bacillus reduces tellurite salts to the metal. It has not been known, however, where the formation of the metal occurred. This new microscope shows clearly that the crystals are not only contained within the diphtheria cells themselves, but that in some cases they protrude through the cells or extend the cellular membrane. When applied to viruses one can see from the picture so produced the shape of the individual molecules. It is, thus, revealed that they are of great length relative to their width and thickness. See also CHEMISTRY; MEDICINE AND SURGERY.

EVERETT S. WALIS

**BIOLOGICAL SURVEY**, Bureau of. A bureau of the U.S. Department of the Interior which was consolidated with the Bureau of Fisheries on June 30, 1940, to form the Fish and Wildlife Service (q.v.).

**BIRDS**. See FISH AND WILDLIFE SERVICE; ZOOLOGY.

**BIRTH CONTROL**. The inclusion of birth control service with other health services available to the public in the United States gained impetus in 1940. This may be attributed to increased understanding and support of physicians, health, and welfare officers, and the lay public. Evidence of this support appeared in the response to a Gallup Poll, released by the American Institute of Public Opinion in January, reporting answers to the question, "Would you approve or disapprove of having government health clinics furnish birth control information to married people who want it?" The vote of those who expressed opinions was 77 per cent affirmative.

At the close of 1940, physicians were serving in 606 birth control centers in this country, as against 553 at the close of 1939. Of them, 109 were in hospitals, as against 96 in 1939; 180 in health departments, compared with 162 in 1939; 252 were supported in whole or in part by public funds, as against 223 in 1939. There has been an increased interest in the teaching of contraception in medical

schools. Physicians direct the work of all birth control centers listed by the Birth Control Federation of America.

Public health nurses acting as field representatives of the Federation in eleven States during the year, have been able under medical direction to take simple contraceptives to women in isolated rural areas and instruct them in their use. Finding that the high rates of infant and maternal mortality among Negroes all over the country, were due in part to ill-advised pregnancies, the Federation set up two special Negro demonstration projects, one urban and one rural. The Federation sponsored and took part in regional Conferences on Tomorrow's Children in Chapel Hill, N C, and in connection with the Harvard Summer School at Boston, Mass. It participated in the National Conference of Social Work, and its affiliated State Leagues took part in State Conferences of Social Work in many states during the year.

The State health departments of North and South Carolina continued extending to indigent women medically directed contraceptive service.

During the year the Federal Trade Commission was active against false therapeutic claims of numerous commercial contraceptives, issuing "cease-and-desist" orders, and bringing suits against a number of manufacturers and sellers of certain products. The Commission has moved, also, against several firms advertising and marketing calendars and slide rules for the so-called "safe period" or "rhythm" method of birth control, stating that the weight of medical opinion was against the statement that absolutely accurate calculations of such periods could be made.

On Mar. 21, 1940, by a vote of three to two, the Supreme Court of Errors of the State of Connecticut handed down a decision upholding the existing law of the State, which is the only one in the country forbidding the "use" of contraceptives, and ruling that, under the statute, it was illegal for physicians to prescribe contraceptives or for patients to use them, even where definite medical indications existed. As a result of this decision all birth control centers in the State were closed, pending effort to change the law.

The Massachusetts Mothers' Health Council secured 44,500 certified names on its initiative petition to change the law in that State. The question will be voted upon by the people of the State in November, 1941. Mrs. Sanger made a tour of the State, speaking in a number of the larger cities. In Holyoke opposition of some of the Roman Catholic leaders resulted in cancellation of rental of two meeting places, and she spoke finally in the quarters of a local textile union, urging support of the initiative petition to the end that the physicians of Massachusetts would again be free to advise patients legally on contraception.

During the year, groups in the States of Maine and Virginia were organized and affiliated with the Birth Control Federation, making 32 co-operating State leagues. D. Kenneth Rose became Executive Vice-President of the Federation and Woodbridge E. Morris, M.D., General Medical Director. Other officers were re-elected. The work of the Federation is sponsored by a National Committee for Planned Parenthood, comprising over 1600 leaders from all walks of life, who actively subscribe to the principle that the privilege of planning a pregnancy should be made as available to families in the economically or geographically restricted portions of our population as it now is to families economically

or geographically better off. The Federation's budget for 1940 was \$152,000, derived mainly from contributions, which are tax-exempt. The program includes, besides the above mentioned medical and field services, consultation service, and a sustained program of public education. The *Journal of Contraception*, published by the Federation, changed its name, in January, to *Human Fertility*, as more truly describing the nature of its contents. See CONNECTICUT under *History*.

**Australia.** Birth control clinics continued operations in Australia, despite the war. Mothers in low income groups are now given a maternity bonus of twenty dollars on the birth of each child, with a small weekly payment for each child after the first in New South Wales.

**England.** The Family Planning Association, headed by Lord Horder, continued work. Clinics still functioned and reported increased attendance due to the war, with its attendant uncertainty and insecurity. Dr. Marie Stopes' clinic was bombed in an October air raid, and partly wrecked.

**France.** The new legal code, put in effect during the year, provided more drastic regulation of contraceptive advertising. The Vichy government bent all efforts to induce a rise in the birth rate and to return women to the home.

**Germany.** Continued strenuous opposition to birth control was coupled with a new policy to raise the birth rate and prevent loss of population due to the war. Women and girls were told that it could become "an exalted task, even outside of wedlock, to become mothers of children begotten by soldiers moving to the front."

**India.** The All-India Women's Conference met in Allahabad in January and adopted a resolution calling for family planning as essential to health, urging instruction in contraceptive technique for all medical officers connected with municipal and government hospitals, dispensaries, and health centers, and asking that advice be given married women at such agencies. The National Planning Commission also passed a resolution urging the establishment of birth control clinics under State direction.

**New Zealand.** The Family Planning Association, as affiliate of the British organization succeeded the Sex Hygiene and Birth Regulation Society and continued to carry on its work.

**Puerto Rico.** Birth control clinic services were established under the Board of Public Health. The *Asociación pro Salud Maternal e Infantil* continued its work to bring simple forms of contraception to the low income group on the Island.

**BLOOD PLASMA.** See MEDICINE AND SURGERY.

**BOBSLEDDING.** Miss Katharin Dewey, 24 years old, attained international fame when she piloted a team to win the national A.A.U. senior "four man" bobsled racing championship on the Mount van Hoevenberg run at Lake Placid.

Miss Dewey, skipper of the Sno Birds of the Lake Placid Club, had for crew three hefty young men, Leo and Pat Martin and Lawrence Straight. They outstripped such favored bobsledders as Bill Linney of Lyon Mountain and Francis Tyler, Lake Placid's Olympic veteran. The Linney-piloted sled was second to Miss Dewey's for four heats and ended as runner-up.

Linney, however, fared better in other competitions. With the Republic Miners Club team, he captained a sled, in which John Kerr, Jerry Blanch, and Angus Clain were crew, to the national junior championship of the A.A.U., and distinguished himself in several other tournaments. He wrested the North American championship, the Adirondack Association A.A.U. senior title, the Governor Herbert H. Lehman Trophy, the Samuel H. Packer Trophy, and the Lowell Thomas International Trophy.

Tuffield Latour, an undertaker, and Paul Dupree, his friend, both of the Saranac Lake A.A., achieved distinction in two-man competitions. They won the national A.A.U. senior and junior titles, the North American championship, the Adirondack Association A.A.U. senior crown, and the Lowell Thomas International Trophy.

**BOHEMIA AND MORAVIA.** Two former provinces of Czecho-Slovakia, which after being shorn of their Sudeten districts by the Munich Accord of Sept. 29, 1938, were occupied by German troops on Mar. 15, 1939, and proclaimed a protectorate of the Reich the following day. Capital, Prague.

**Area and Population.** The protectorate has an area of 19,058 square miles (Bohemia, 12,525; Moravia, 6533) and a population estimated at 6,804,875 on Jan. 1, 1939 (Bohemia, 4,472,353; Moravia, 2,332,522). The inhabitants are Czechs except for a small German minority. The chief cities, with their 1937 populations, are: Praha (Prague), 962,200; Brno (Brunn), 291,800; Moravská Ostrava, 178,099 in 1935; Plzeň (Pilsen), 124,353 in 1935.

**Production, etc.** See 1939 YEAR BOOK, p. 181-182 for statistical data on Czecho-Slovakia before the partition. Little statistical information on the protectorate of Bohemia and Moravia has since become available. Agriculture, manufacturing, forestry, and commerce are the chief occupations. Cereals, corn, potatoes, beet sugar, tobacco, and flax are the chief crops. Leading industrial products: Arms, rayon and other textiles, wood pulp, cement, shoes, glass, leather goods, iron and steel products, and innumerable others. Western Bohemia is one of the leading industrial areas of Europe. The protectorate is an important source of coal, iron ore, salt, zinc, and antimony.

**Finance.** The budget for the autonomous administration of the Protectorate in 1939 was: Receipts, 4,638,000,000 crowns; expenditures, 4,902,-

000,000 crowns (1 reichsmark equals 10 crowns).

**Government.** For the governmental system previous to the German occupation, see 1939 YEAR BOOK, p 182. The terms of the Protectorate were set forth in the decree signed by Chancellor Hitler and several members of his Cabinet on Mar. 16, 1939. Bohemia and Moravia were declared to "belong henceforth to the territory of the Great German Reich." Germany assumed direct control of the Protectorate's defense, foreign affairs, communications and postal and telephone systems, customs, currency. The Protectorate was declared autonomous, with its own organs, authorities, and officials.

But these prerogatives, according to the decree, are exercised "in accordance with the political, military and economic importance of the Reich" "The Head of the Protectorate must have the confidence of the Fuehrer and Reich Chancellor for the discharge of his duties." The German Chancellor appoints a "Reich Protector in Bohemia and Moravia," who as Hitler's representative and as delegate of the Reich Government "has the task of seeing that the lines of policy laid down by the Fuehrer . . . are observed." The Protector was empowered to dismiss all members of the Protectorate's government, reject its measures, and prevent the promulgation of its laws, decrees and orders as well as the execution of administrative measures and judicial decisions. The decree gave the Reich Government blanket authority to "promulgate orders applicable to the Protectorate in so far as the common interest demands it."

The decree made all German inhabitants of the Protectorate German nationals and Reich citizens, subject to German jurisdiction and to "the regulations for the protection of German blood and German honor." Other inhabitants were declared "nationals of the Protectorate." Chancellor Hitler on Mar. 18, 1939, appointed Baron Constantin von Neurath, former German Foreign Minister, as Reich Protector, with headquarters at Prague. Karl Hermann Frank, a leader of the Sudeten German agitation against the Czecho-Slovak Republic before the Munich Accord, was appointed State Secretary of the Protectorate, with control over both German and Czech police. Dr. Emil Hacha, elected President of the Czecho-Slovak Republic by the National Assembly Nov. 30, 1938, and signer of the capitulation agreement of Mar. 15, 1939, remained in office as President of the Protectorate. The government of the Protectorate, as reconstructed Apr. 27, 1939, was headed by Gen. Ing. Alois Eliaš. Over and above the rule of the Reich Protector and the puppet government of the Protectorate was the rule of the German secret police and military commanders.

Measures placed in effect during 1939 under the decree of March 16 completed the transformation of Bohemia and Moravia into an authoritarian state completely subservient to Berlin and serving as a political and economic appendage of the Reich (see 1939 YEAR BOOK, p 183 f). The National Unity party (Czech) and the National Socialist party (a branch of the German Nazi party) were the only legal political groups permitted, and both were under close German supervision.

#### HISTORY

Nazi administration of the Protectorate in 1940 was marked by an extension of German political and economic control, a determined effort to de-

nationalize and Germanize the Czechs, the ruthless crushing of efforts at opposition, and the continued stubborn resistance of the Czechs to all forms of pressure.

Under its new German managers and owners, Czech industry was converted into a vast arms factory with the great Skoda and Brno munitions and armament works as a basis. Numerous Jewish-owned textile plants were taken over by Germans and converted to the manufacture of uniforms and other war supplies. The application of anti-Semitic measures was used to transfer control of further industries and properties to German hands, while Czech manufacturers, bankers, and business men were increasingly driven out of business and replaced by Germans. Czech public and private revenues were expropriated. More workers were drafted for labor service in the Reich. More Czech properties and natural resources were appropriated for German war needs or, it was charged, simply stolen by the Nazi party organization in the Protectorate and the Gestapo (secret police). There was systematic persecution of intellectuals, priests, members of patriotic organizations and former soldiers and public servants who sought to "maintain Czech thought."

Czech universities and many high schools were closed as centers of anti-Germanism. Books of great Czech national writers were banned. Publications of all kinds were strictly censored and many articles appearing in newspapers under Czech names were said to have been written at German dictation. From time to time during the year reports from the Protectorate by way of Prague, Belgrade, Rome, Paris or London told of large-scale arrests of Czechs by the Gestapo, of crowded prisons, of persecution in concentration camps, of continued acts of violence by individual Czechs against Germans, of extensive sabotage by Czech workers in munitions and other industries, and of intensified Czech passive resistance to German measures and demands.

There was a steady trickle of Czech fugitives from the Protectorate to neighboring countries. At the end of January Dr. Jaromir Necas, Controller of Prices for the Eliaš Government, and Ladislav Feierabend, Minister of Agriculture, fled from Prague to France. An Associated Press report from Prague, dated February 9, stated that from 500 to 600 leading Czechs had been placed in "protective custody." Other reports indicated that the Gestapo had been successful in arresting many members of Czech underground organizations engaged in sabotage and anti-German propaganda. On May 6, after several killings of Germans by Czechs, the Reich Protector decreed the death sentence for possession of firearms or munitions by Czechs without permission of the German authorities. Czech sources in London reported in September that 650 followers of Dr. Beneš had been arrested during the previous week in the Protectorate. A total of 43,000 Czechs were said to be in concentration camps and more than 9000 under "protective arrest." Following the German victory over France, the Germans were reported to have adopted a much harsher attitude toward the Czechs.

Meanwhile the German authorities lent encouragement to the activities of the small Czech Fascist party—known as the Vlájka—as another instrument of warfare upon the Czechs. Commencing in January, Ian Rys, militant leader of this group, fiercely attacked the Czech Govern-

ment as well as Jews, Freemasons and other anti-German elements. The revered Masaryk, founder and first President of the Czechoslovak Republic, was denounced by some of Rys' leading associates. Emboldened by the special privileges extended to its members by the Germans, the Vlastka later demanded replacement of all Czech police by Germans, removal of the Czech Government and the Czech Mayor of Prague, and the signing by President Hacha of an oath of allegiance to Chancellor Hitler. On March 16 Rys threatened an armed revolt against the Czech Government.

Combined pressure from Czech Fascists and from German authorities was reflected in the telegram sent to Hitler by President Hacha on Mar. 15, 1940, the first anniversary of the German military occupation. It referred to the "valuable advantages" bestowed by German protection and concluded with a prayer "for blessing and fortune for the glorious armies of Germany which protect the Czech people."

Hitler replied that Germany did not intend to "threaten Czech national existence or bring their national conscience into conflict with the general necessities of the Reich." He expressed hope of "preserving this part of the Reich from the horrors of war." On the same day the leader of the Czech National Unity party issued a statement accepting the German version that President Hacha on Mar. 15, 1939, had of his own accord requested Hitler to take Bohemia and Moravia under his protection. He declared Hacha's "decision" was the only right one and promised to make the Protectorate a safe base for the German army by hard work in factories, offices, and fields. This statement was apparently inspired by fear that the German authorities planned to replace the National Unity party by the Czech Fascist party as the only legal Czech political group. On April 23 the Hacha Government dropped its persistent opposition to acceptance of the German Nuremberg laws against the Jews. Following the arrest of many National Unity party leaders, a reorganization of the Hacha Cabinet was announced in Berlin on August 17.

In March and April the Germans organized an armed force of 8000 Czechs, formerly non-commissioned officers in the republican army, to maintain internal order. They were distributed in seven garrison towns, thus relieving German troops for service on the Western Front. Further measures restricting bank payments to Jews were announced January 27. The forced emigration of Jews to Poland and elsewhere continued. Germans from the Italian Tirol and from the Reich proper were brought into the Protectorate to take the places and positions of deported Jews and of Czech farmers and other workers drafted for labor service in the Reich.

Another important step toward economic absorption of Bohemia-Moravia in the Reich was the unification of their monetary systems and the elimination of customs and exchange barriers, effective October 1. The par value of the Czech crown was fixed at one-tenth of one reichsmark, the ratio in effect since March 1939. Previously the Germans had partially adjusted the Czech wage and price structure to that of the Reich. Nevertheless higher prices prevailing in Germany tended further to deplete the Protectorate's commodity reserves. Competition between Czech and German industries within the free trade area was restricted by quota and price agreements between

various branches of industry in both territories and by the extension to Bohemia-Moravia of the German import and export permit system. Exports of raw materials, semi-manufactures and foodstuffs from Bohemia-Moravia to Germany after October 1 were made subject to special permit from the Minister of Commerce or the Import-Export Office at Prague.

**BOLIVIA.** A republic of South America. Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the government.

**Area and Population.** Taking into account the Chaco boundary settlement of 1938 (see YEAR BOOK, 1938, p. 131 f.), Bolivia has an area estimated at 537,792 square miles. The population on Dec. 31, 1939, was estimated at 3,457,000, divided racially as follows: White, 13.08 per cent; mestizo (mixed), 27.51; Indian, 52.34, others, 7.07. Foreigners in Bolivia in 1940 included about 5000 Germans and German-Bolivians, 475 citizens of the United States, and about 500 British. Estimated 1936 populations of the chief cities were: La Paz, 200,000 (250,000 in 1940); Cochabamba, 52,323, Oruro, 44,826; Potosi, 35,900; Santa Cruz, 31,300; Sucre, 27,508. Spanish is the language of the educated classes. The Indians speak mainly Quechua and Aymara.

**Education and Religion.** The illiteracy rate, which was 83.5 per cent for that part of the population seven years and over in 1900, remains high. The school enrollment in 1936 was: Elementary, 73,854; secondary, 5522, special schools, 4615, universities, 1482. Roman Catholicism is recognized as the State religion. Public exercise of other forms of worship is guaranteed.

**Defense.** There is compulsory military training. The Chaco War of 1932-35 with Paraguay left Bolivia with numerous war veterans and considerable armament. Armed effectives in November, 1940, totaled 14,060 (army, 13,900; air force, 160).

**Production.** Mining is the chief industry; minerals accounted for 94 per cent of the value of all 1939 exports. Mineral exports in 1939 in metric tons, with the value in pounds sterling in parentheses, were: Tin, 27,648 (£6,262,715); silver, 225 (£613,645); wolfram, 2002 (£465,070); antimony, 10,060 (£344,021); lead, 14,119 (£215,359); copper, 4056 (£178,738); zinc, 7769 (£114,853); gold, 271,595 fine grams (£65,124); bismuth, 13 (£5485). Crude petroleum production was about 14,000 metric tons in 1938. Agriculture and stock raising are other leading occupations. Wheat, quinoa, corn, rice, barley, sugarcane, cotton, coca leaves, tobacco, and coffee are the chief crops. The principal manufactures are alcohol and beverages, foodstuffs, textiles, and clothing. A 1937 survey covered 406 industrial establishments with a total capital of 128,744,159 bolivianos and a production valued at 192,391,300 bolivianos.

**Foreign Trade.** Imports in 1939 were valued at 66,401,727 bolivianos (70,558,889 in 1938); exports, 117,399,540 (94,829,659 in 1938). In current United States dollars, the 1939 imports totaled \$24,237,000; exports, \$42,851,000. See *Production* for chief exports. Textiles, wheat, flour, sugar, live animals, and machinery are leading imports.

For distribution of trade, see *YEAR BOOK*, 1939, p 81 Also see *TRADE, FOREIGN*.

**Finance.** Budget estimates for 1939 balanced at 300,669,856 bolivianos and an actual surplus of 61,230,000 bolivianos was reported. The original estimates for 1940 balanced at 627,000,000 bolivianos, but a decree of June 29, 1940, reduced expenditures for the second semester of the year by 65,072,181 bolivianos, or 20 76 per cent

As of Dec. 31, 1939, the Central Bank placed the external consolidated dollar debt at \$100,202,549 (principal, \$60,896,849; unpaid interest, \$39,305,700), the external sterling debt at £634,739, and the internal funded debt at 356,689,370 bolivianos. There was in addition a floating debt of 986,939 pounds sterling and 42,668,914 bolivianos due the Central Bank as of Jan. 19, 1940, and an ordinary floating debt of 22,847,854 bolivianos as of Dec. 31, 1939. The boliviano was linked to the pound sterling at the rate of 140 per pound from June, 1938, until May 10, 1940, when it was pegged to the dollar at 40 to 1 for the duration of the European War. The average official exchange rate was 32 33 bolivianos to the dollar in 1939; curb rate, July–December, 1939, 45 46 bolivianos to the dollar

**Transportation.** Exclusive of lines under construction, Bolivia had 1402 miles of railway line in 1940 Under the Bolivian-Brazilian treaty of Feb 25, 1938 (see *YEAR BOOK*, 1938, p 97) work proceeded during 1940 on the first section (Corumbá–El Carmen, 70 miles) of the railway that will link the Corumbá terminus of the Brazilian network with the Bolivian railways at Vila Vila via Santa Cruz de la Sierra Construction of the Sucre–Camiri railway was renewed Commencement of work on the projected extension of the Argentine railway system from the border station of Yacuiba to Villa Montes and beyond was envisaged in a provisional accord signed with Argentina (see *History* for details). Highway mileage (1939), 10,154 Five steamers operate on Lake Titicaca (12,500 feet above sea level) Statistics of Lloyd Aereo Boliviano, a Junkers subsidiary, for 1939 were: Miles flown, 478,030; passengers, 18,407; freight, 3510 metric tons. La Paz, Oruro, and Uyuni are stations on the Pan American–Grace Airways network A new radio telephone circuit between the United States and La Paz via Buenos Aires was opened Apr 26, 1940

**Government.** The 1938 Constitution (see *YEAR BOOK*, 1938, p 96 for chief provisions) was suspended Apr. 24, 1939, and restored Oct 6, 1939, as described in *YEAR BOOK*, 1939, pp 82–83. President at the beginning of 1940, Gen. Carlos Quintanilla, who assumed office "by vote of the officers of the La Paz garrison" on Aug 23, 1939, upon the death of President Germán Busch For developments in 1940, see *History*.

### HISTORY

**Constitutionalism Restored.** The steps taken by Provisional President Quintanilla in 1939 to restore constitutional government (see *YEAR BOOK*, 1939, pp 83–84) were crowned with success in 1940. Gen. Enrique Peñaranda, commander-in-chief of the Bolivian army during the latter part of the Chaco War, was elected President on March 10 with the backing of the Quintanilla Government and of four of the five established political parties. He received more than 70 per cent of the votes cast while the other 30 per cent were divided between José Antonio Arce, leader of the

newly organized Young Socialist party, and Gen Bernardino Bilbao Rioja, who had been deported to Chile on Oct. 27, 1939. The election was orderly and uncontrolled by the government. Elections for 105 Deputies and 27 Senators, also held in March, favored the moderate and rightist parties. A Liberal–Republican Socialist bloc won control of the Senate and held a strong position in the Chamber, but the election of numerous independents and some leftists to the lower house made the balance of power there in doubt.

Displeased by the electoral results, extreme leftist politicians joined with some of the younger army officers in an attempted military coup on March 26 The revolt of some 2000 troops of the La Paz garrison was frustrated by prompt action on the part of Gen. Antenor Ichazo, army chief of staff. Four leftist leaders, the head of the military school, and the commander of the Presidential Palace Guard were arrested as leaders of the conspiracy. A state of siege was proclaimed throughout the republic, but it was indicated that popular opinion strongly supported the government. The inauguration of General Peñaranda as President followed on April 15 It was the first time since the installation of President Salamanca in 1931 that the government had changed hands without a military coup

**Peñaranda's Policies.** The new chief executive continued the retreat from the radical and quasi-totalitarian policies of President Busch, begun under Provisional President Quintanilla In his inaugural address he pledged that his government would be democratically inspired, support inter-American solidarity, and promote economic collaboration with neighboring States. He invited investments of foreign capital to develop Bolivia's agricultural and pastoral riches, pledged resumption of payments on the foreign debt which had been in default since 1932, and said his government would strive to revive the mining industry, develop internal communications, and build additional hydro-electric power plants At the same time the President sought to conciliate potential enemies by granting amnesty to ex-President David Toro, who had been in exile since 1937, and by appointing Gen. Bilbao Rioja military attaché to the Bolivian Legation in London. Ringleaders of the March revolt were likewise freed

President Peñaranda's cabinet reflected election returns in that it included representatives of most of the political parties and independents, with Liberals and Republican Socialists predominant Although the President continued to rule by decree pending the convening of Congress on August 6, he ended the state of siege on May 7 and abolished previous curbs on the press and public agitation The Young Socialists and other radical groups meanwhile had organized a Left Front under Dr Arce and launched a vigorous campaign against the government's middle-of-the-road economic and other policies On July 26 rioting broke out between rival political factions in Oruro during a Left Front convention The government then arrested Dr. Arce and other prominent leftists and imposed a state of siege in Oruro Department The prisoners were liberated by an amnesty decree affecting all political offenders, issued on October 18

The cabinet resigned on November 4 when Congress passed a measure requiring reduction of the ministry from 11 to 8 portfolios. The new cabinet sworn in November 11 represented diverse political opinions and was considered more strongly pro-

democratic. It included Gen. Carlos Blanco Galindo, former Provisional President, as Minister of Defense and Colonization.

**Legislation, etc.** Among the measures to which the leftists objected were the Quintanilla decrees of January 13 and February 9 prohibiting strikes by railway employees and forbidding their participation in certain political activities. Another highly controversial issue was the progressive repeal of President Busch's drastic mining legislation of June 7, 1939 (see *YEAR BOOK*, 1939). On March 19 all limits on the amount of dividends the mining companies could pay in foreign currencies were abolished. On May 15 the companies were granted reduced quotas for delivery of their foreign exchange to the government at the official rate. Also their taxes were further reduced. In return, the companies agreed to increase monthly tin exports to 3000 metric tons. As a result of this, production and exports of tin showed a marked upturn. The rising foreign demand for tin and other Bolivian minerals virtually doubled the total national income from exports as compared with the months preceding the European War.

At the same time the government took steps to curb speculation in certain types of goods, establish a farm credit system, restrict importation of luxuries, and establish a new social security system and wages-and-hours code worked out by two experts of the International Labor Office. Economic conditions remained extremely difficult, however, and this enhanced the government's problem in seeking to allay discontent. Inflationary factors caused the curb exchange rate of the boliviano to decline to 81 to the dollar on July 17. The Minister of Finance then raised the compensation rate from 53.40 to 70 bolivianos per dollar, pegged the boliviano to the dollar at 2½ cents, and took other steps by which exchange rates were stabilized during the last quarter of the year as follows: Controlled, 39.90 bolivianos to the dollar, compensation, 55; curb, about 60.

Currency in circulation increased from 547,000,000 bolivianos in June, 1939, to 770,900,000 bolivianos a year later. The price index for the city of La Paz (Base 1931 = 100) increased from 746 in January, 1940, to 769 in June. On July 31 the government extended the price control measures introduced April 4 by setting up price regulating committees in each departmental capital. They were empowered to fix prices of both imported merchandise and domestic products. A drought, combined with a continued shortage of foreign exchange, resulted in a scarcity of meat, sugar, corn, potatoes, and certain other foodstuffs during the last quarter of the year.

President Peñaranda on October 5 recommended that Congress renew payments on the defaulted public debt, appropriating for that purpose 2 per cent of the general revenues in 1941, 4 per cent in 1942, 6 per cent in 1943, 8 per cent in 1944, and 10 per cent in 1945 and annually thereafter. A succession of strikes during October culminated in a serious railway tie-up. This was ended through government intervention and the concession of a wage increase. An influx of Jewish refugees into La Paz and other cities led Opposition deputies on September 8 to pass a bill authorizing cancellation of immigration permits issued to Jews.

**Nazi Activities.** Unrest was also stirred up by well-organized German propaganda, directed against both British and American "imperialism and capitalism" and their alleged servants in Bo-

livia. A correspondent of the *New York Times*, after surveying the situation in Bolivia in July, 1940, charged that the German Legation in La Paz and the Bolivian branch of the German Nazi party were preparing a "fifth column . . . to help the Germans wrest control of the Bolivian tin industry from the United States if Germany wins the war." He reported that the Nazis and their Bolivian sympathizers were strongly entrenched in the government, army, and all departments of economic life, that they subsidized or directly controlled important sections of the press and radio, and that some leftist and rightist Bolivian leaders were in their pay. Guillermo Gutiérrez, director of *La Razon*, leading La Paz newspaper, charged that German and pro-German importers in Bolivia were using profits from the sale of United States goods for pro-Nazi, anti-United States, and anti-British propaganda.

Pro-Ally sentiment was not lacking, however. Italy's entrance into the war and the collapse of France led demonstrators to attack the German and Italian legations in La Paz on June 12.

**Foreign Relations.** Foreign Minister Alberto Ostria Gutiérrez, who was retained in his post by President Peñaranda, was active during 1940 in forging closer economic and political ties with all of Bolivia's neighbors. After a five-day visit to Buenos Aires, Dr. Gutiérrez on April 2 signed three agreements with the Argentine Foreign Minister. Two of these provided for quicker clearance of passengers' baggage at the frontier and extension of Argentine telegraph lines from Yacuiba to Aguairá in Bolivia. The third accord defined the basis for the construction of the projected railway between Yacuiba on the Argentine frontier and Santa Cruz de la Sierra, and for joint Argentine-Bolivian exploitation of the Bolivian oil fields tapped by the railway (see *YEAR BOOK*, 1937, p. 97 for previous accord).

Under this provisional agreement, the Argentine government agreed to advance funds for construction of the first section of the railway from Yacuiba to Villa Montes (62 miles). The sum advanced was to be repaid from the output of the San Andita oil field (25 miles north of Yacuiba). The Argentine Government also undertook to advance up to 500,000 pesos for boring new wells in the San Andita field and to build a pipeline from Bolivian wells near Aguas Blancas on the Bermejo River to the railhead at Orán in the Argentine Province of Salta. The accord bound Argentina also, if the output of the Bolivian wells justified it, to finance construction of the other sections of the railway to Santa Cruz de la Sierra and of a branch line from Boyubie to Sucre, already started by the Bolivian Government. It was stipulated that the projected railways were to be operated and managed exclusively by the Bolivian Government.

By this agreement, La Paz officials hoped to avert the threatened collapse of the government petroleum monopoly established to exploit Standard Oil properties expropriated in 1937. Under management of the monopoly, Bolivian fields were producing only 30 per cent of the republic's needs. The government was forced to import petroleum at high prices while contributing heavily to the expenses of the monopoly.

Modification of Bolivia's attitude in the oil expropriation controversy appeared likely as a result of this situation and of economic collaboration extended by the United States Government. In September the La Paz authorities accepted an offer of

United States technical aid in reviving the once important rubber industry of northeastern Bolivia. It was announced October 4 in Washington that the State Department, at the request of the Bolivian Government, had assigned two officers of the Engineer Corps, U.S. Army, to survey the cost and feasibility of completing the railway between Vila Vila and Santa Cruz de la Sierra (see under *Transportation*). Shortly afterward Warren Lee Pierson, president of the United States Export-Import Bank, conferred with Bolivian officials in La Paz.

Following conferences in Washington with Bolivian tin producers, Jesse Jones, Federal Loan Administrator, announced October 19 that the Metals Reserve Company, a subsidiary of the Reconstruction Finance Corporation, would build or finance a large tin smelter in the United States. In contracts signed with the Metals Reserve Company November 4, five Bolivian tin producers undertook to furnish sufficient tin ores and concentrates to produce 18,000 tons of fine tin annually for five years. The Bolivian Government guaranteed faithful performance of the contracts by the producers.

No appreciable progress was recorded during 1940 toward carrying out the Bolivian-Paraguayan economic accords of Apr 21, 1939 (see *YEAR BOOK*, 1939), and of Oct 20, 1939. The latter accords provided (1) for the construction as soon as possible of a communications route uniting the two countries by land, (2) for appointment of a mixed commission to draft a trade treaty, (3) for negotiation of a convention permitting transit of Bolivian products via the Paraguay River, (4) for establishment of a permanent air line between La Paz and Asunción, and (5) for furtherance of intellectual, cultural, and scientific exchange between the two countries. The two governments indicated their continued collaboration, however, by jointly pushing plans for a regional economic conference of the River Plate republics.

**BOTANY.** *Physiology.* The prize of The American Association for the Advancement of Science, given annually for a notable contribution to science, was awarded this year to Prof. Dennis R. Hoagland, Dr. D. I. Arnon, and their associates at the University of California for their paper on the manner in which the roots of plants take in nutrients. These investigators reached the conclusion that the absorption of mineral salts by the roots is a dynamic process, the necessary energy being supplied by the protoplasm of the roots. In order to take in the mineral nutrients, the roots must be actively absorbing oxygen.

Many papers along physiological lines have been published during the year. These have dealt with

such topics as the carbohydrate mechanism, the structure of chloroplasts, the process of photosynthesis, the role of auxins and hormones, the stimulating effect of vitamins, the growth of excised roots, and photoperiodism. New data on these various topics have been accumulated and published in the *Annals of Botany*, *Botanical Gazette*, *New Phytologist*, *Plant Physiology*, *Contributions from the Boyce Thompson Institute*, *Bulletin of the Torrey Botanical Club*, the *American Journal of Botany*, *Journal of Agricultural Research*, and other botanical publications. Swingle (*Bot. Rev.* 6: 301) has given an extensive review of regeneration and vegetative propagation, discussing the results obtained on studies not involving the application of growth substances, as well as those which do.

A series of papers (*Amer. Assoc. Adv. Sci. Pub.* 14), presented in a symposium on *The Cell and Protoplasm* by several zoologists and botanists, has been published. These papers give a general background for the present state of our knowledge. From the botanical standpoint, the walls of the plant cells, the structure of viruses, and vitamins are discussed.

Soil-less gardening still attracts a great deal of attention. Gericke, one of the first men responsible for its recent development, has published a book (Prentice Hall, Inc.) describing his various experiments and methods. Laurie has also published a book (McGraw-Hill) along the same general line. Both books give practical instructions for the successful growing of plants in a nutrient culture. The history of the culture of plants in nutrient solutions has been reviewed by Shive (*Scient. Monthly* 51: 233). His article serves as a very good historical background and emphasizes the important part that the subject has played in the development of plant physiology.

*Ecology.* Many contributions have been published along various ecological lines in the 1940 volumes of the *Journal of Ecology*, *Ecological Monographs*, *New Phytologist*, and elsewhere. The studies have involved such topics as the influence of environmental factors on tree growth, the natural establishment of white pine, the regeneration of longleaf pine in abandoned areas, the succession of plants on abandoned and eroded farmland, the occurrence of grasslands and relic prairie areas in central Wisconsin.

*Genetics and Cytology.* Many papers dealing with such topics as the mutations caused by X-rays, the effect of colchicine in changing the chromosome number and the structure of chromosomes, and the inheritance of various characters, have appeared in the *Annals of Botany*, *Journal of Heredity*, *Hereditas*, *American Journal of Botany*, and other publications. Chemicals have been used to induce mutation in species of *Aspergillus*. Interesting results on the effect of colchicine in producing polyploids in cotton, lily, and other plants have been obtained. Tetraploids in dioecious plants of *Melandrium* and different species of *Amaranthus* have resulted from the colchicine treatment. Other papers have dealt with such subjects as root-knot resistance in beans and the occurrence of natural hybrids between species.

Dermen (*Bot. Rev.* 6: 599) has reviewed the very extensive recent literature on colchicine polyploidy and technique. Allen (*Bot. Rev.* 6: 227) has summarized the data on the genotypic basis of sex-expression in Angiosperms.

*Evolution.* Campbell has published an extensive

volume on *The Evolution of the Land Plants* (Stanford Univ. Press), a topic in which he has been interested for many years. His book deals with the liverworts, mosses, ferns, and seed plants, all of which are grouped under the general name of Embryophyta. He reviews the extensive data on the development of individual groups of the land plants and the possible lines of their evolution, considering in detail the many theories concerning their origin which have been presented.

**Mycology and Plant Pathology.** *Insect Transmission of Plant Diseases* has been treated fully in an extensive volume by Leach (McGraw-Hill). The important role of insects in relation to certain plant diseases caused by bacteria, fungi, and viruses, is very completely considered. Reed (*Amer. Jour. Bot.* 27: 135) has summarized extensive data on physiologic specialization in the oat smuts; 29 distinct races of loose smut and 14 of covered smut have been differentiated. Papers have appeared on the life history of several of the water molds, a group of organisms which has been largely neglected until recent years. Christenberry (*Elisha Mitchell Sci. Soc. Jour.* 56: 333) has described the species of Mucorales in the Southeastern United States, 54 species belonging to 6 families being listed in his work. Raper (*Elisha Mitchell Sci. Soc. Jour.* 56: 241) has described the formation and organization of the pseudoplasmodia in a member of the slime mold group.

**Taxonomy.** In the *Bulletin of the Torrey Botanical Club* for May several papers on *The Concept of the Genus* in botany have been published. The history of the generic concept, the conservative view-point in the delimitations of genera, and changing concepts as the result of modern studies, are topics considered. Hall in *The Genus Tulipa* (Royal Hort. Soc., London) has prepared a very complete monograph on this genus of great important horticultural value. The main center for the occurrence of the species of tulips is in Asia Minor, a few extending into Europe, as well as farther east in parts of Asia. Hall recognizes 72 species, which he groups into two main sections. The text is accompanied by 40 fine color plates. Ownbey (*Ann. Mo. Bot. Gard.* 27: 371) has studied the genus *Calochortus*, which belongs to the lily family. The species are widely distributed throughout the Western United States, a few extending east of the Rocky Mountains. Three sections of the genus are recognized and these are divided into 12 subsections. The basal chromosome number of the sections differs, in one being 7, in another 9, and in another 10 chromosomes. A few polyploids are known. Hybridization apparently is very rare in nature among the species. The author describes 57 species and 13 varieties. Larisey (*Ann. Mo. Bot. Gard.* 27: 119) has monographed the species of the genus *Baptisia*, a member of the legume family. This genus is found in the Eastern United States, extending well into the South and as far west as Texas. The author recognizes 30 distinct species, 6 being described as new, and 11 varieties. Further, there are at least 8 clear-cut cases of hybrids recorded and several others are suspected. It is evident that, under favorable natural conditions, hybridization commonly occurs between species of *Baptisia*. A further series of papers on the botany of the Maya area of Central America (*Carnegie Inst. Wash. Pub.* 522) has appeared. These are based on the materials collected by the 1936 Michigan-Carnegie Botanical Expedition to British Honduras. Species belonging to seven large families

are treated by specialists of each. An extensive monograph by Clausen, Keck, and Hiesey (*Carnegie Inst. Wash. Pub.* 520) on their *Experimental Studies on the Nature of Species* has appeared. This work deals particularly with the effect of environment on Western North American plants which have been transplanted to new areas and their behavior observed. Hiesey (*Bot. Rev.* 6: 181) has published a review of the papers dealing with the environmental influence and transplant experiments.

Jaeger (Stanford Univ. Press) has prepared an excellent manual on the *Desert Wild Flowers* found in the two main desert areas of California. The book is a very useful one for identifying the plants in these regions, the text being accompanied by good line drawings and valuable photographs. Steyermark (*Mo. Bot. Gard., Field Mus. Nat. Hist., Chicago*) has prepared an excellent *Spring Flora of Missouri*. The book will serve also for surrounding areas. Good drawings of many of the species accompany the text. Fassett has written *A Manual of Aquatic Plants* (McGraw-Hill). The territory covered is from the Atlantic Coast to Minnesota and Missouri. Keys and illustrations of the higher aquatic plants are given. A special feature is a key based on vegetative characters.

**Microtechnique.** Two up-to-date books on methods of preparing plant cells and tissues for study have been published. Johansen (McGraw-Hill) has written a very complete book which will serve not only as a laboratory guide but as a general book of reference on methods. The book by Sass (McGraw-Hill) is more elementary in character and is primarily adapted for use as a laboratory manual.

**Textbook.** Transeau, Sampson, and Tiffany have written a *Textbook of Botany* (Harper & Bro.). This general text gives more than the usual amount of attention to physiological and ecological topics. A special feature is the introduction of four color plates.

GEORGE M. REED

**BOUNDARIES, State.** See SUPREME COURT **BOUNDARY DISPUTES.** See INTERNATIONAL LAW and the following countries under *History*: BULGARIA; ECUADOR; FRENCH INDO-CHINA; GUATEMALA; HUNGARY; MANCHOUKUI; MONGOLIA; RUMANIA; SLOVAKIA; THAILAND.

**BOWLING.** Honors in bowling in 1940 went almost exclusively to the mid-west. The only easterner to gain distinction in championship tournaments was Fred Fischer of Buffalo who won the all-events crown in the American Bowling Congress. In the A.B.C. bowl-fest in Detroit, the five-man team title was awarded to the Monarchs of Chicago; Herbie Frietag and Joe Sinke of Chicago won the doubles and Ray Brown of Terre Haute, Ind., took the individual honors.

In the Women's International Bowling Congress at Syracuse, Chicago produced all the victors. The winning entrants included the Logan Square Buicks team of five, Tess Morris and Dorothy Miller in the doubles, Sally Twyford in the individual and Tess Morris in the all-events.

The A.B.C. classic at Detroit's State Fair Grounds attracted 30,000 bowlers from 731 cities and 100,000 spectators during its 60-day run. The tournament produced two perfect games. George Pallage of Akron rolled 300 on April 15 and his feat was duplicated a week later by Angelo (Mike) Domenico of Canton, O.

More than 6000 women entered the I.B.C. competition for a cash prize total of \$33,000.

**BOXING.** The defeat of stout-hearted Henry Armstrong and the cool destruction of opponents by Joe Louis were outstanding features in the prize ring in 1940. Armstrong pitched forward on his face as the bell ended the 15th and final round of his bout with Fritz Zivic at Madison Square Garden on October 4 for the welterweight championship of the world. He lost therewith the last of his three championship titles, crowns which he had at one time worn simultaneously, the only man to achieve that distinction in the whole history of boxing.

The heavyweight championship was defended four times during the year by Joe Louis, but there were no million dollar gates. When Louis knocked out Arturo Godoy in 1:24 of the eighth round of their bout June 20 at the Yankee Stadium, the gross receipts amounted to \$149,505, which was the biggest gate of the year. Previously Louis had defeated Godoy in a 15-round decision in February, an undertaking in which the champion was not particularly impressive. He was much more effective in his fight with Johnny Paycheck in March, winning the encounter by a knockout in the second round. His last bout of the year was with Al McCoy in Boston in which he forced his opponent to quit under the impetus of a terrific beating. In all Louis earned \$129,312 during the year, making a total of earnings of \$1,722,908 from the time he first entered the prize ring in 1934.

For action, Armstrong took the year's honors. He successfully defended his welterweight crown against Joe Ghouly, Pedro Montanez, Paul Junior (twice), Ralph (Ripper) Zannelli, and Phil Furr before the ill-starred night of October 3 when Fritz Zivic, Pittsburgh cyclone, hammered his way to the title in a smashing victory. Besides these tilts, Armstrong flattened Jenkins in six rounds when the lightweight champion sought the welterweight crown in July.

After becoming the title-holder, Zivic won on a foul from Al Davis in October.

Davis began the year by losing on points to Lou Ambers in an over-the-weight match in February. The National Boxing Association later declared Ambers's title void, and recognized Sammy Angott as champion when he outclassed Davey Day in May. Nevertheless, Lew Jenkins's three-round knockout of Ambers in May gave him what many fans regarded as a serious claim to the lightweight title. In November, Jenkins successfully defended his alleged title by putting Pete Lello to sleep in two rounds.

In the middleweight class, Ceferino Garcia managed to keep his title in a bout with Armstrong only to lose it to Ken Overlin who thereafter retained the crown against the challenge of Steve Belloise in two battles in Madison Square Garden.

Billy Conn, intent on entering the heavyweight division, nevertheless retained his light-heavyweight title in a championship fight with Gus Lesnevich.

In the featherweight class, there were three claimants to the crown, with Harry Jeffra and Petey Scalzo attracting the most attention. Lou Salica pounded his way to general recognition as the bantamweight king. Little Dado was more or less regarded as the flyweight champion.

**BRAZIL.** A republic of South America, comprising 20 States, the Federal District, and one Territory. Capital, Rio de Janeiro.

**Area and Population.** Area, 3,286,170 square

miles; population, estimated at 45,002,176 in 1940 (30,635,605 at 1920 census). Immigrants in 1939 included 15,120 Portuguese, 1975 Germans, 1414 Japanese, and 1004 Italians. United States citizens residing in Brazil Jan. 1, 1940, numbered 4086. There are strong infusions of Negro and Indian blood in the northern States. Estimated populations of the chief cities in 1937 were: Rio de Janeiro, 1,801,784 (1,896,998 in 1940); São Paulo, 1,217,330; Recife (Pernambuco), 510,102; São Salvador (Bahia), 363,726 (1935); Porto Alegre, 352,068; Belem (Para), 303,740. Portuguese is the official and principal language, but Italian and German are widely used.

**Defense.** Military training is compulsory for all males from 21 to 45 years of age, the first year in the ranks and the rest in the reserve. The army's peace strength in 1939 was 112,320, air force, 2700. Trained army reserves numbered 258,300. The navy consists of 2 battleships and 3 cruisers, all laid down in 1907 but extensively refitted, 8 or more destroyers and torpedo boats, 3 river monitors, 4 submarines, and 6 minelayers.

**Education and Religion.** About 70 per cent of the adult inhabitants are illiterate. In 1936 there were 30,000 primary schools, 447 high schools, 383 domestic schools, 328 normal schools, 874 special schools, and 248 superior schools conferring degrees, with an aggregate enrollment of 3,064,440. The State university is at Rio de Janeiro and there are three private universities at Porto Alegre, Belo Horizonte, and Curitiba. Roman Catholicism is the predominant religion.

**Production.** Agriculture, stock-raising, and manufacturing are the chief occupations. Brazil ranks first in coffee production, second in cacao, and third in sugar and tobacco. Coffee accounted for 40 per cent of the value of all 1939 exports, raw cotton 21 per cent. The value of all agricultural production was estimated at 8,550,000,000 milreis in 1937; industrial production, 12,000,000,000 milreis. Coffee production in 1939-40 was estimated at 22,561,300 bags (of 132 lb.), cotton, 1,525,000 bales (of 500 lb.). Yields of other chief crops in 1938-39 were (in metric tons): Sugar, 1,131,342; castor beans, 170,707; corn, 6,020,700 (1937-38); rice, 1,327,000 (1937-38); potatoes, 338,900 (1937-38); cacao, 136,100 (1937-38); cotton seed, 1,060,000.

Mineral and metallurgical production in 1939 was valued at 584,007,000 milreis, of which gold (4350 kilograms) accounted for 110,400,000 milreis. Output (in metric tons) included: Coal, 1,045,975; laminated iron, 98,649; pig iron, 160,016; steel, 112,174; cement, 497,793; manganese (exports), 189,003 long tons. Salt, diamonds, monazite, chrome, and other minerals are produced. The forests yield rubber, carnauba wax, oil seeds, and hardwoods. The chief manufacturing industries are cotton weaving, sugar refining, flour milling, meat packing, and the fabrication of machinery, paper, textile products, electric power, and tobacco products.

**Foreign Trade.** Exports in 1939 totaled 5,615,519,000 milreis (5,096,890,000 in 1938); imports, 4,983,632,000 (5,195,570,000). The leading exports in 1939 were (in milreis): Coffee, 2,234,280,000; raw cotton, 1,159,420,000; hides and skins, 245,345,000; cacao, 224,586,000. Of the imports the United States supplied 33.6 per cent in 1939 (24.2 in 1938); Germany, 19.2 (24.9); United Kingdom, 9.3 (10.4); Argentina, 8.4 (11.8). The United States took 36.2 per cent of the 1939 exports (34.3

in 1938); Germany, 12 (191); United Kingdom, 9.6 (8.8); France, 6.3 (6.4). See **TRADE, FOREIGN.**

**Finance.** Actual ordinary budget returns for 1939 were: Revenues, 3,795,000,000 milreis; expenditures, 4,335,000,000, deficit, 540,000,000; new bond issues, 633,000,000. Under the extraordinary public works and national defense budget, revenues were 558,000,000 milreis, expenditures, 516,000,000. The 1940 budget estimates placed total revenues at 4,209,417,000 and expenditures at 4,421,842,000 milreis. On Dec. 31, 1939, the internal funded debt was 5,081,000,000 milreis; floating debt, 2,541,000,000 milreis. On Apr. 2, 1940, the Minister of Finance reported the foreign debt equivalent to £256,000,000 (Federal, £155,000,000, State, £77,000,000; municipal, £24,000,000). The total included £156,000,000 in sterling obligations, £89,000,000 in dollars, £10,000,000 in francs, and £1,000,000 in florins (See *History* for resumption of debt payments.) The official exchange rate for the milreis was \$0.059 for 1939 (\$0.056 in 1938); curb rate, \$0.048 in 1939 (\$0.05 in 1938).

**Transportation, etc.** Brazil's railway mileage in 1939 was about 21,200, highway mileage, 129,057 (see **ROADS AND STREETS**). Financial returns of all railways for 1938, considered as a group, showed a combined net deficit of 32,172,000 milreis; they transported 174,026,000 passengers and 33,479,000 tons of freight. Work went forward during 1940 on the joint Bolivian-Brazilian line that will link Santos and the Brazilian railway network with Santa Cruz de la Sierra (see **BOLIVIA**). Among important highways under construction in 1940 were the São Paulo-Jundiaí highway and sections of the great eastern trunk road that will eventually link Porto Alegre in the south with Para in the north.

Regular mail and passenger air lines cover approximately 50,000 miles of routes; they include Pan American Airways, the Condor (German) Syndicate, and the Rio de Janeiro-Santiago (Chile) service of the Deutsche Luft Hansa, which was resumed Mar. 18, 1940, after a six-months' interruption. The French transatlantic air service was interrupted by France's defeat in June. Ala Littoria's new Rome-to-Rio service was reported discontinued after Italy's entrance into the European War. In September, Pan American Airways opened a cut-off route between Para and Rio de Janeiro that reduced flying time between Miami and Rio to three days. Routes of the Brazilian military airmail service extended 9269 miles in 1938. The Brazilian merchant marine on June 30, 1939, included 305 vessels of 487,820 tons.

**Government.** The Constitution of Nov. 10, 1937, provided for the reorganization of Brazil along the lines of a corporative State (see **YEAR BOOK**, 1937, p. 102). Actually President Getúlio Vargas continued to rule as a personal dictator. He became provisional President Nov. 3, 1930, after leading a successful military revolt. Under the Constitution of July 16, 1934, he was elected constitutional President the following day for a four-year term. The 1937 Constitution extended his term for six years from 1938. For 1940 developments, see *History*.

#### HISTORY

**Internal Politics.** Little change in the political situation occurred during 1940. President Vargas continued his personal rule without creating the governmental organs called for by the 1937 Constitution, but made progress with his nationalistic

program of social reform and economic development.

Another of the sporadic conspiracies against the Vargas regime was reported crushed on March 25. The Federal Interventor for the State of São Paulo closed a leading newspaper, *O Estado de São Paulo*, and arrested the editors of the paper, most of the State's former Deputies in the National Congress closed by Dr. Vargas, and other prominent figures affiliated with the political groups opposing the President's rule. At the same time precautionary measures were taken in Rio de Janeiro. The police alleged that 45 machine guns were found in the offices of the suspended newspaper. However the Security Tribunal in Rio de Janeiro found evidence against the 41 prisoners insufficient and they were exonerated. *O Estado de São Paulo* was permitted to resume publication with governmental control of its editorial policies.

Other indications of unrest were the arrest of several army officers in Porto Alegre, capital of Rio Grande do Sul, and the roundup in Rio de Janeiro in mid-April of about 50 alleged Communists charged with plotting a revolution. On April 27 it was announced that 64 "Communists" had been sentenced to three to seven years at hard labor. These developments were followed by reports that President Vargas was considering the advisability of restoring a genuinely constitutional regime. On January 4 he had established a new Press and Propaganda Department under which the worst aspects of the press censorship were eliminated. During a visit to Montevideo early in February, Foreign Minister Oswaldo Aranha was reported to have attempted unsuccessfully to effect a rapprochement between President Vargas and Gen. J. A. Flores de Cunha, former political leader of Rio Grande do Sul, who had broken with the President and taken refuge in Uruguay (see **YEAR BOOK**, 1937, p. 103). The arrest of 10 Integralistas (Fascists) at Petropolis on October 12 was followed by a new drive against the movement.

In a sensational speech delivered June 11 President Vargas outlined his ideas concerning Brazil's future political course. Speaking immediately following Italy's declaration of war upon France and President Roosevelt's denunciation of that act, Vargas tacitly defended the policies of the European dictatorships by asserting that "vigorous peoples fit for life must follow the route of their aspirations." He said the world was "marching toward a future different from all we know in economic, political, and social organization," that "old systems and antiquated formulas have entered a decline," and that it was necessary to "remove the debris of old ideas and of sterile ideals," including "improvident liberalism" and the "sterile demagoguery of political democracy." This frank espousal of pro-Fascist principles aroused severe criticism in democratic circles in Brazil and in most of the other American republics. Similar ideas were expressed by Minister of Government Francisco Campos in a book, *Estado Nacional*, published in October.

**Economic Developments.** Pressing his program for rapid industrialization of Brazil under government direction, President Vargas sought the co-operation of the United States Steel Corp. in establishing a \$44,000,000 steel mill to exploit the rich Itabira iron ore deposits. The plan was approved by the corporation's technical experts, but rejected by its finance committee. The President then appointed a National Steel Plan Executive Commission to carry the scheme forward.

On September 26 a Brazilian mission in Washington obtained from Jesse H. Jones, Federal Loan Administrator, a pledge of a \$20,000,000 4-per cent loan from the United States Export-Import Bank for the construction of the mill. Constituting a first claim against the plant, the loan was guaranteed by the Brazilian Government and was repayable in 20 semi-annual installments starting three years from the first advance. It was conditional upon the investment of milreis to the value of \$25,000,000 in the enterprise by the Brazilian Government and affiliated interests. The Export-Import Bank reserved the right to concur "in the selection of the managerial officers of the mill company, the engineers, and contractors, and the purchase of materials."

Through the government's initiative, a United States drilling company brought in several small oil wells in the Bahia field, giving Brazil its first local petroleum supply. By a decree of July 24 the President expropriated the Brazil Railway Co., a large French-owned holding company controlling important railway, colonization, industrial, and hotel enterprises. The company also held large blocks of Brazilian Federal and State securities. It was accused of mismanagement, corruption, embezzlement, and insolvency. A private corporation operating the Para docks was taken over by the government in April to secure payment of a debt amounting to \$25,000,000.

It was announced in August that a stoker developed by a United States concern had solved the problem of making the low-grade Brazilian coal available for general commercial use, thus reducing the country's long dependence upon high-grade coal imported from Britain and Germany. A contract for the construction of an airplane factory at Lagoa Santa to build planes for the government was approved by a decree law of May 6, 1940.

Other economic legislation facilitated the tourist trade, reserved to Brazilians the exclusive right to exploit mineral deposits, provided for compulsory insurance in certain fields and stipulated that all reinsurance should be handled by the government-controlled National Reinsurance Institute. A decree of March 8 authorized resumption of partial interest and amortization payments on Brazil's foreign indebtedness, effective Apr. 1, 1940, to Mar. 31, 1944. Instead of the debt service payments of £23,630,000 annually called for under the original loan agreements, the decree fixed payments at £4,140,000 for each of the first two years, at £4,170,000 for the third year, and at £4,550,000 for the fourth year. The debt situation was then to be re-examined. The service of Brazil's foreign debt was suspended Nov. 10, 1937.

The spread of the European War during 1940 cut Brazil off from important export markets and resulted in the accumulation of additional surpluses of coffee, cotton, cacao, rice, and other products. Heavy price declines had severe repercussions upon Brazil's internal economy. The government made strenuous efforts to open new outlets for these products in the United States, the other American republics, South Africa, Japan, and elsewhere. The United States loan and the influx of some \$35,000,000 of investment capital brought in by European refugees had a stimulating influence upon the national economy. At the year end it was reported that Brazil was almost clear of foreign exchange difficulties and that manufacturing and real estate were booming.

An experimental three-year minimum wage law

and a law establishing the eight-hour day with overtime for Sunday and night work were promulgated May 1. An ambitious public works program designed to facilitate the settlement and exploitation of the hinterland was carried forward, especially after President Vargas's 10,000-mile trip through the Amazon region in October. In August arrangements were made to end the labor shortage at the Ford rubber plantations and other Amazonian enterprises by moving farm laborers from the northeast drought region.

**Brazilianization.** The Vargas regime continued its efforts to stamp out German, Italian, and Japanese political activity and propaganda among colonists of German, Italian, and Japanese origin (see preceding YEAR BOOKS). Seventy-eight Japanese schools in the State of São Paulo were closed for alleged violation of the Brazilian school laws. German activities proved more difficult to curb. Investigations by reliable correspondents revealed that Nazi and Fascist agents and propagandists were actively working among the large Brazilian-German and Brazilian-Italian colonies to secure Brazil's national disintegration and economic subjugation as a prelude to political domination. Terrorism, economic pressure, bribery and corruption, and indoctrination of Nazi-Fascist principles were the methods used. Important elements of the Brazilian press, radio, and moving picture industries were said to be in German pay. There was danger of a revolution supported by "fifth column" elements that would replace President Vargas with a completely Nazified regime. For a comprehensive survey of the situation, consult the series of articles by Russell B. Porter in the *New York Times* of June 26-July 2, 1940, inclusive.

**Foreign Relations.** Brazilian sympathies were reported to be strongly pro-Ally, particularly after the German invasions of additional neutral countries during 1940. However many army officers and some other influential Brazilian elements were said to be pro-Nazi, as well as the bulk of the population of German origin. With Germany master of Europe and a British victory seemingly remote, Brazil faced the prospect of having its products permanently barred from that continent unless the government co-operated with Berlin in political as well as economic matters. This situation led President Vargas to follow a policy of strict neutrality toward European affairs. At the same time he affirmed Brazil's adherence to the Pan American principles of continental solidarity against overseas economic, military, and ideological threats.

To calm the alarm aroused throughout the Americas by his speech of June 11 (see above), President Vargas on June 15 cabled President Roosevelt that his remarks were "in no sense contradictory" to the Charlottesville, Va., address of Mr. Roosevelt on June 10. His loyalty to the inter-American mutual defense policy was demonstrated when the Uruguayan Government appealed for aid in crushing the Nazi revolt plot discovered on May 29. The Vargas Government not only sold Uruguay 5000 rifles and ammunition but offered military assistance in suppressing the threatened uprising. It was revealed that Brazil had made Uruguay a similar offer of naval assistance the preceding December when the German pocket battleship *Graf Spee* refused to leave Montevideo harbor within the time limit fixed by Uruguayan authorities.

The United States steel loan and the growing collaboration between the United States and the British Empire served to offset Axis intrigues and

propaganda in Brazil. General Pedro Aurelio de Goes Monteiro, chief of staff of the Brazilian Army, made another inspection of United States defense preparations in October in company with the Argentine chief of staff. Some irritation towards Britain developed toward the year end as a result of the removal of 22 Germans from the Brazilian freighter *Iatpe* by a British cruiser only 18 miles from the Brazilian coast on December 1, and the detention at Gibraltar of a Brazilian steamer bound for Brazil from Italy with German war materials purchased by the Brazilian Government in 1938. However an Anglo-Brazilian trade and financial accord was concluded June 20 and in mid-November a British economic mission visited Rio de Janeiro to further mutual trade and iron out difficulties created by the blockade.

A commercial accord signed with Argentina on January 23 after a four-day visit to Buenos Aires by Foreign Minister Aranha provided for reciprocal reduction of tariffs and other measures to promote mutual trade. Finance Minister Pinedo of Argentina returned this visit in October. On October 6 he signed an Argentine-Brazilian accord providing "in principle" for the exchange of surpluses between the two countries and for guarantees against the raising of tariffs in one country against the products of new industries developed in the other. A trade agreement with Italy concluded in January called for purchases of Italian merchandise by Brazilian Federal, State, or municipal authorities to the amount of 200,000,000 lire annually, to be balanced by Italian purchases of Brazilian goods.

See ARGENTINA and URUGUAY under *History*; COFFEE; FASCISM; INDUSTRIAL CHEMISTRY; NAVAL PROGRESS; PAN AMERICANISM; PAN AMERICAN UNION.

**BREMEN, State of.** See GERMANY under *Area and Population*.

**BRETHREN, German Baptist (Dunkers or Dunkards).** A religious organization founded in Schwarzenau, Germany, in 1708 by a group of Pietists and established in Germantown, Pa., in 1719 under the leadership of Peter Becker. There are four denominations of Brethren in the United States, the largest and oldest group being the Church of the Brethren, or Conservative Dunkers, with headquarters at Elgin, Ill. For statistics, see RELIGIOUS ORGANIZATIONS.

**BRIDGES.** Bridge design and construction were extremely active during 1940, due largely to the rapid extension and improvement of the highway system of the country. Besides conspicuous large bridges, there were innumerable minor interesting and notable structures of both steel and concrete. These minor structures included many for separation of grades at intersections of railways with highways and intersections of highways, some of these being complicated structures involving special features in design or imposing special conditions in construction to minimize interference with traffic. The financing of many of these highway bridge projects was assisted by Federal aid, and traffic on some of the larger bridges is subject to toll in order to produce revenue for retiring the bridge bonds. A bill to relieve the railways from the entire cost of altering any of their bridges over navigable streams was vetoed by the President in June, although such alterations are to facilitate navigation and are of no benefit to the railways concerned.

But on the other hand from new bridge construc-

tion, a survey of the national highway system in relation to the defense program has disclosed that large numbers of old bridges are unsafe or at best inadequate for modern traffic and military requirements. On the railway system, also, there are many bridges inadequate to carry safely the loads of modern locomotives and trains. Thus there must be a program for bridge strengthening and replacement, as well as a program for new construction. Awards in 1940 for the handsomest bridges built in 1939 included: (1) large bridges, the White-stone suspension bridge of 2300-ft. span in New York City; (2) smaller bridges, the Valley River footbridge of girder type at Murphy, N C; (3) movable bridges, the 127-ft. double-leaf bascule bridge at Alpena, Mich.

**Notable Steel Bridges.** Four more bridges over the Mississippi River were opened in 1940: at Rock Island, Ill., July 17; at Baton Rouge, La., August 10; at Natchez, Miss., September 26, and at Greenville, Miss., October 5. All carry highways, but the Baton Rouge bridge also carries the Louisiana & Arkansas Railway. A fifth bridge, at Jefferson Barracks, 12 miles below St. Louis, was begun.

**Rock Island Bridge.** five steel bowstring arches with floor system suspended from the arch ribs; two channel spans of 540 ft., two of 395 ft. on the Iowa side, and one of 395 ft. on the Illinois side; viaduct approaches, two 22-ft. separated roadways and two 4-ft. walks outside the trusses; cost, \$2,500,000. **Baton Rouge Bridge.** three continuous cantilevers form five spans of 490, 858, 650, 858, and 490 ft.; two 22-ft. roadways between the trusses, and two railway tracks carried outside. **Natchez Bridge.** continuous cantilevers form five spans of 560, 875, 875, 798, and 560 ft., counting from east end, the 875 ft. spans are the longest on the Mississippi; total length, 3668 ft., or 8136 ft. with approaches; cost, \$3,450,000. **Greenville Bridge.** cantilever main span of 840 ft., with two anchor arms or side spans of 640 ft.; cost, \$4,200,000. **Jefferson Barracks Bridge.** cantilever main span of 805 ft., with anchor arms of 670 ft., or 2145 ft. in all, exclusive of approaches consisting of truss and girder spans.

A new bridge over the Ohio River at Owensboro, Ky., opened in June, 1940, is of the cantilever type, with four successive spans of 343 ft. (anchor arm), 629 ft., 751 ft., and 278 ft. (anchor arm); 22-ft. concrete roadway; total length, 4623 ft.; cost, \$2,300,000.

Of special interest is the *Niagara Falls Bridge*, to replace the steel arch structure wrecked by ice in January, 1938. It consists of a steel arch span of 960 ft., with the arch ribs seated 55 ft. above normal water level, or 29 ft. above those of the seats of the old bridge arches. The deck, 220 ft. above the water, will have two 22-ft. roadways, separated by a 4-ft. strip, and a 10-ft. sidewalk on the upstream side. Total length of bridge, 1450 ft.; to be completed in September, 1941.

Two steel arch spans of 456 ft. are included in the highway bridge being built over the Susquehanna River at Havre de Grace, Md., and a 240-ft. steel arch is the main item of a bridge 1248 ft. long over the Alabama River at Selma, Ala. This latter bridge, with ten concrete arches of 41½- to 154½-ft. span at each end, has a total length of 1248 ft.; it has two 20-ft. roadways and two 5-ft. walks.

Among outstanding steel bridges of 1940 the following may be noted: (1) *Shasta Bridge*. Since

the reservoir formed by the Shasta Dam, in California, will submerge a part of the Southern Pacific Railway, the line has been relocated at a higher level and will cross the Pit River arm of the reservoir by a double-deck cantilever bridge carried by the highest masonry bridge piers ever built, the highest of the two rising 358 ft above the river bed and being 95 × 90 ft at its base. The main span is 630 ft., with two anchor arms of 497 ft. and three side spans of 282 ft. On the lower deck is the double-track railway, and on the upper deck a 40-ft roadway with two narrow walks (2) *Thomas A. Edison Bridge*, over the Raritan River at Perth Amboy, N.J., opened in September for the New Jersey State Highway Department. It includes the largest, deepest and heaviest plate girders ever built for bridges; for the main span of 200 ft., each of the two girders is 260 ft long (cantilevering 60 ft beyond one pier), 20½ ft. deep at the piers and 12 ft at the middle and ends, with a weight of 198 tons. Next to it is a 250-ft span over the ship channel, and then eight spans of 200 ft., all carrying two separated 24-ft roadways, with approaches, the total length is 4388 ft and the cost \$4,670,000 (3) *Potomac River Bridge*, at Ludlow Ferry, between Morgantown, Md., and Dahlgren, Va., for the Maryland State Roads Commission. Cantilever type, with 800-ft main span and two 366-ft anchor arms, truss spans of 118 to 350 ft and steel trestle approaches make a total length of nearly two miles, of which 33 per cent is trestle. The foundations include the longest steel piles ever driven, 194 ft. The bridge has two 24-ft roadways and was opened to traffic on Dec. 14, 1940 (4) *Lorain County*, Ohio, dedicated two new four-lane bridges over Black River for an improved highway system. One has a continuous-truss structure 1700 ft long, covering a central span of 400 ft, two of 300 ft, two of 250 ft, and one of 200 ft. It has a four-lane 42-ft undivided roadway. The other structure was a bascule bridge, noted below (5) *Narragansett Bay Bridge*, a toll bridge between Rhode Island and Conanicut Island, completed in 1940. The 640-ft cantilever channel span, with 135-ft headway for vessels, has two anchor or side spans of 256 ft, and adjacent spans of 270 ft; total length, 7000 ft; cost, \$3,000,000; it carries a 22-ft roadway and a 3-ft sidewalk (6) *Haarc de Grace Bridge*, a highway toll bridge over the Susquehanna River. Total length, 7600 ft., including two steel arch spans of 456 ft; cost, \$2,500,000.

**Movable Bridges.** Besides the novel concrete floating draw span of the Lake Washington pontoon bridge (noted below), two steel draw spans of different types were built in 1940. A bridge over the Passaic River at Newark, N.J., has a vertical-lift span of 325½ ft moving between steel towers and operated by cables. This span, weighing 650 tons without its floor, was floated into position by barges in September. It is 40 ft above water when lowered and 135 ft when raised. The bridge was opened on Jan. 27, 1941. The draw span in the Erie Ave. bridge over the Black River at Lorain, Ohio, is a double-leaf bascule 333 ft between centers of its trunnion bearings. It is the longest highway draw span of its type, and is exceeded only by a railway bascule bridge of 338 ft. span at Sault Sainte Marie. It has two 22-ft roadways, separated by a 3 ft. strip, and has two 7-ft. sidewalks.

**Suspension Bridges.** A startling event in bridge history was the sudden destruction of the 2800-ft. suspension span over the Narrows at Tacoma,

Wash., by a fierce wind on November 7. The bridge had only been in service a few weeks, but its floor or deck had been found to be excessively flexible, partly due to its relatively light stiffening girders and floor framing. The wind set up longitudinal waves of considerable height as well as lateral tilting and twisting of the deck, the motion culminating in the entire floor system and the stiffening girders of the main span tearing loose from the suspenders and falling into the water. The main and suspender cables were left practically intact. By good fortune, nobody was hurt. Experiments had been started to find some way of stiffening the bridge and checking the extreme oscillation of the floor. Somewhat similar troubles, but on a much smaller scale, had occurred on the new Whitestone Bridge of 2300 ft span in New York, but had been overcome by means of diagonal stay cables radiating from the tops of the towers to the longitudinal stiffening girders. Stay cables for the same purpose have been applied also to two other bridges, the Deer Isle Bridge of 1080 ft span, in Maine, and the Thousand Islands Bridge of 800 ft span over the St. Lawrence River.

The new Wabash River Bridge of 350 ft main span at Hutsonville, Ill., is one of the five suspension bridges of the self-anchoring type in the United States. In this type, the ends of the cables are attached to the ends of the stiffening trusses or girders, instead of to the usual massive masonry anchorages buried in the ground. Another feature of this bridge is that each cable consists of nine separate strands, instead of having all the strands bunched together to form a single large cable.

**Pontoon Bridge.** The floating highway bridge across Lake Washington, near Seattle, which was opened to traffic on July 12, differs radically from other pontoon bridges and is the first of its type. Instead of the usual series of boats or pontoons connected by timber spans which carry the floor and allow for free passage of water, the Lake Washington bridge consists of a continuous line of concrete pontoons rigidly connected end to end and held in position by anchor cables on both sides. Each pontoon is 59 ft wide, 350 ft. long and 14½ ft. deep, with its deck 7 ft. above the water and providing a 45-ft. roadway and two 4-ft walks. The total length is 6561 ft. For navigation, there is a 200-ft channel which is opened and closed by a pontoon 378 ft. long which is moved in and out, telescoping a forked pontoon, by means of power operated cables.

**Concrete Bridges.** Of the many arch, girder, and rigid-frame concrete bridges built in 1940, few were of such size or design as to receive the attention accorded to the larger steel bridges. Nevertheless, many of them were of highly attractive appearance, and many formed parts of complicated grade-separation projects. In bridges of the girder type, a development is the use of hollow box girders instead of the conventional web girders, thus making it practicable to use longer spans. Some bridges of this type on California highways have spans up to 120 and 130 ft.

A handsome concrete arch bridge built over Russian Gulch by the California Division of Highways, in 1940, is an example of many such structures. It has a span of 240 ft., with two graceful arch ribs on which stand vertical columns supporting the deck framing and floor. The longest concrete arch in the world is said to be the 672-ft span on the Esla Bridge, in Spain, completed in July, 1940, on a railway between Zamorra and Corunna.

The Ohio State Highway Department replaced an old steel truss bridge by two concrete arch spans of 150 ft. each, carrying spandrel columns which support a deck having two 24-ft roadways separated by a 4-ft. central strip, while outside are two 3-ft. sidewalks. With its concrete girder approach spans the bridge is 514 ft. long.

On super-highways extending out of Toronto, Canada, twin bridges of girder type have been built in place of a single wide bridge with separated roadways. Each bridge has a 34-ft. three-lane roadway. Another novel structure is a bridge composed of four precast concrete slabs or girders placed side by side to form the floor and span of a three-span structure; each slab is 85 ft. long, weighs 135 tons, and also carries one line of rails fastened to the concrete by anchor bolts. The two outside girders have brackets to support a station platform, the structure carrying the Canadian National Railways over a double or divided road. The five concrete arches of 250-ft. span for the new Waterloo Bridge over the Thames, in London, were reported as completed in 1940, but the work may have been damaged or halted by the war.

**Foreign Bridges.** War conditions have resulted in damage and destruction of a vast number of bridges in European countries. Three bridges in other foreign countries may be noted: (1) *Hooghly River* highway cantilever bridge at Calcutta, India. Steel erection is in progress, main span 1500 ft., with anchor arms or side spans of 325 ft. It is unusually wide, having a 71-ft. roadway (with double-track electric street-car line) between the trusses, and two 15-ft. walks outside. (2) *Hawkesbury River* truss bridge in Australia, for the New South Wales Government Railways. Work is in progress on the foundations for a bridge having eight truss spans of 348 ft., with floor 40 ft. above high water. This structure will replace one built in 1889 which is inadequate for present train loads. (3) *Brisbane River Bridge* at Brisbane, Queensland, Australia, opened in 1940. A highway bridge of cantilever type with main span of 924 ft. and two anchor-arm spans of 270 ft. In length of span of Australian bridges it ranks second to the 1000-ft. steel-arch bridge at Sydney, New South Wales.

**Bridge Design and Construction.** The increasing use of welding in place of riveting has influenced both the design and the construction work of steel bridges. And there has been marked increase in the use of the rigid-frame type of structure, both in steel and concrete. In this type, the supports or columns are formed as integral parts of the span, resembling a horseshoe with flattened top. Some of the first all-welded rigid-frame bridges in the United States are included in the approaches to the new Main Ave. bridge at Cleveland, Ohio. Each of these bridges consists of two parallel frames  $26\frac{1}{2}$  ft. apart, with the girder or top member 130 ft. long and welded to two supporting columns 70 ft. apart, the girders extending 30 ft. beyond them to rest on the abutments.

Besides new construction, there has been interesting and difficult work in the alteration, strengthening, and improvement of existing bridges. For example, the stringing of new cables for the Ohio River suspension bridge at Portsmouth, Ohio, which has a main span of 700 ft. and side spans of 350 ft. The bridge had been closed to traffic on account of the discovery of broken wires in the original cables. Owing to the construction of the Bonneville Dam on the Columbia River, the water level was raised and thus necessitated the raising

of a cantilever highway bridge by 45 ft. This was done by means of jacks on the piers. The bridge, built in 1926, has a central span of 705 ft. and anchor-arm side spans of 211 ft. See FOUNDATIONS.

E. E. RUSSELL TRITMAN.

**BRIDGES DEPORTATION CASE.** See COMMUNISM.

**BRITAIN, Battle of.** See EUROPEAN WAR under *The Battle of Britain*.

**BRITISH CAMEROONS.** See CAMEROONS, BRITISH.

**BRITISH COLUMBIA.** Canada's most westerly province. Area, 366,255 square miles, population (1939 estimate), 774,000 compared with (1931 census) 694,263. Chief towns (1931 census figures in parentheses): Victoria, capital (39,082), Vancouver (246,593), New Westminster (17,524), North Vancouver (8510), Trail (7573), Nanaimo (6745), Prince Rupert (6350), Kamloops (6167). Vital statistics (1939). 12,344 living births, 7511 deaths, and 7862 marriages. Education (1938). 169,902 students in schools and colleges of all kinds.

**Production.** The gross value of agricultural production for 1939 totaled \$43,828,000. Chief field crops (1939). Oats 6,111,000 bu., wheat 1,875,000 bu., potatoes 96,900 tons, roots 56,000 tons, hay and clover 315,000 tons, alfalfa 160,000 tons, fodder corn 70,000 tons, grain hay 113,000 tons. Apple crop (1940) 2,026,100 barrels. Livestock (1939). 314,700 cattle, 168,900 sheep, 68,300 horses, 49,800 swine, 4,783,000 poultry. The fur production in 1938-39 was valued at \$1,117,000 (\$814,532 in 1937-38). Forestry output (1938) was equal to 598,402 M cu. ft. valued at \$42,894,803. The 1939 fish catch (208,610 tons) was worth \$17,699,000, of which salmon accounted for \$12,995,000.

Mineral production (1939) was valued at \$65,216,745 of which gold (626,970 fine oz.) accounted for \$22,659,323, lead (378,440,666 lb.) \$11,992,784, zinc (279,041,497 lb.) \$8,563,784, copper (73,253,403 lb.) \$7,392,734, silver (10,648,031 fine oz.) \$4,311,175, coal (1,537,905 tons) \$9,464,061. Manufacturing (1938, including the Yukon): 1785 factories, 42,213 employees, \$90,471,828 net value of products. During 1939 a total of 11,993,815 net registered tons of shipping entered the port of Vancouver.

**Government.** Finance (1939-40) revenue, \$32,826,438, expenditure, \$33,043,243 (including \$3,596,841 for direct relief). On Oct. 31, 1939, the gross public debt was \$188,193,050 (including \$40,119,668 of treasury bills) against which the sinking funds amounted to \$36,131,705. The King is represented by a lieutenant-governor (appointed by the governor-general in council) who is aided by a ministry which is responsible to the legislature and resigns when it fails to retain the confidence of that body. In the legislature there are 48 members (31 Liberals, 8 Conservatives, 7 C.C.F.'s, and 2 others were elected on June 1, 1937), elected for a five-year term by adult suffrage. Six senators (appointed for life) and 16 elected commoners represent British Columbia in the Dominion parliament at Ottawa. Lieutenant-Governor, Eric W. Hamber (appointed May 1, 1936); Premier, T. D. Pattullo (Liberal).

**History.** It was announced during May, 1940, that the special session of the legislature adjourned after the passage of two measures which gave the

provincial government power to take over and operate the fuel-oil and gasoline business of British Columbia, including specific powers for the expropriation of existing oil companies. See CANADA.

**BRITISH EAST AFRICA.** See KENYA, NYASALAND, TANGANYIKA TERRITORY, UGANDA, ZANZIBAR

**BRITISH EMPIRE.** The world's largest empire, comprising an area of 13,353,952 square miles and a population of about 500,775,000. It consists of

1. The United Kingdom of Great Britain and Northern Ireland. See GREAT BRITAIN, IRELAND, NORTHERN.

2. Self-governing Dominions—AUSTRALIA, CANADA, NEWFOUNDLAND (temporarily administered as a crown colony), NEW ZEALAND, UNION OF SOUTH AFRICA

3. IRELAND (EIRE), a sovereign, independent state, associated for certain purposes with the United Kingdom and the self-governing dominions, which are sometimes referred to collectively as the British Commonwealth of Nations

4. INDIA AND BURMA

5. Self-governing colonies—CEYLON and SOUTHERN RHODESIA

6. Crown colonies and protectorates—ADEN, BAHAMAS, BARBADOS, BASUTOLAND, BECHUANALAND, BERMUDA, BRITISH GUIANA, BRITISH HONDURAS, BRITISH SOLOMON ISLANDS, BRITISH SOMALILAND, CYPRUS, DOMINICA, FALKLAND ISLANDS, FIJI, GAMBIA, GILBERT AND ELLICE ISLANDS, GIBRALTAR, GOLD COAST, GRENADA, HONG KONG, JAMAICA, KENYA, LEIWARD ISLANDS, MALTA, MAURITIUS, NIGERIA, NORTHERN RHODESIA, NYASALAND, ST. HELENA, ST. LUCIA, ST. VINCENT, SEYCHELLES, SIERRA LEONE, STRAITS SETTLEMENTS, SWAZILAND, TRINIDAD AND TOBAGO, UGANDA, ZANZIBAR

7. Protectorates of a special nature—BRITISH NORTH BORNEO, BRUNEI, FEDERATED MALAY STATES, SARAWAK, UNFEDERATED MALAY STATES

8. Mandates held by the United Kingdom—BRITISH CAMEROONS, PALESTINE, TANGANYIKA TERRITORY, TRANS-JORDAN, TOGOLAND (British sphere)

9. Mandates held by Dominions—NAURU (Australia), NEW GUINEA (Australia), SOUTH-WEST AFRICA (Union of South Africa), WESTERN SAMOA (New Zealand)

10. Dependencies of Dominions—LABRADOR (Newfoundland), ASHMORE AND CARTIER ISLANDS, PAPUA, NORFOLK ISLAND, AUSTRALIAN

ANTARCTIC TERRITORY (Australia); UNION ISLANDS or TOKELAU and ROSS DEPENDENCY (New Zealand)

11. Territories held under condominium—ANGLO-EGYPTIAN SUDAN (United Kingdom and Egypt), NEW HEBRIDES (United Kingdom and France).

See the separate articles covering each of the above countries except those included in the preceding table, and some included under the tables of *Area and Population* of the articles on AUSTRALIA, BRITISH MALAYA, NEW ZEALAND, and WINDWARD ISLANDS

**BRITISH GUIANA.** A British crown colony in northern South America. Area, 89,480 square miles, population (1938 estimate), 337,521, of whom 142,736 were East Indian immigrants. During 1938 there were 10,016 births and 8704 deaths. Capital, Georgetown, 67,584 inhabitants in 1938. Education (1938) 237 primary schools had 53,373 pupils enrolled

**Production and Trade.** Sugar, rice, rum, coconuts, coffee, limes, timber, gold, diamonds, and bauxite are the main products. There are deposits of manganese, mica, and vegetable pitch. Livestock (1938) 134,951 cattle, 32,662 sheep, 26,418 swine, 12,279 goats, 7344 donkeys, and 2678 horses. Trade (1939) imports, \$10,724,621 (flour, cotton goods, wearing apparel, sulphate of ammonia were the chief items); exports, \$14,505,552, of which sugar accounted for \$8,131,239, bauxite, (476,013 tons) \$2,889,368, gold (38,473 oz), \$1,060,616, rice, \$582,546; rum, \$430,107; diamonds, \$424,860. Shipping (1938) 3472 vessels totaling 1,808,602 tons entered and cleared.

**Government.** Finance (1938) revenue £1,302,520, expenditure £1,312,177, funded public debt (Dec 31, 1938) £4,467,300. The British Guiana (Constitution) Orders in Council of 1928 and 1935 provide for the government of the colony, and for the introduction of a legislative council of 30 members (the governor as president, 2 ex-officio, 8 nominated official, 5 nominated unofficial, and 14 elected) which is to be dissolved every five years, unless previously dissolved, and a general election held. A governor, aided by an executive council, heads the executive and administrative branch of the government. Governor, Sir W. E. F. Jackson (appointed Jan. 19, 1937).

**History.** British Guiana was one of the British colonies in which the United States was authorized to establish air and naval bases by the Anglo-American accord of Sept 2, 1940. The base sites chosen by an American board of inspection and approved by the British authorities were announced November 18 as follows: (a) a patrol plane squadron base, with airfield, on the bank of the Demerara River 25 miles from its mouth; (b) a seaplane base near Suddie on the west bank of the mouth of the Essequibo River. The American consulate at Georgetown, closed seven years before as an economy measure, was ordered reopened July 27, 1940, due to Washington's concern over the colony's future.

Plans for the trial settlement of European refugees in the interior, announced in 1939 (see YFAR Book, 1939), were delayed in 1940 by the difficulty encountered in raising private funds for the undertaking. The British Government had agreed to build a motor highway to the interior if a privately-financed initial settlement proved successful.

It was announced in May that £52,000 had been allotted to British Guiana from £350,000 appropri-

Country (Capital)	Sq. ms.	Population	Location
Basutoland (Maseru)	11,716	562,311 <sup>1</sup>	South Africa
Bechuanaland (Mafeking <sup>2</sup> )	275,000	262,756 <sup>1</sup>	South Africa
Gambia (Bathurst)	4,068	199,520 <sup>1</sup>	West Africa

<sup>1</sup> 1936 census. The total for Basutoland is exclusive of 101,273 absentee natives working in the Union of South Africa at the time of the census. <sup>2</sup> In Cape Province. <sup>3</sup> 1931 census. <sup>4</sup> 1938 estimate. <sup>5</sup> Includes dependent islands (87 sq. mi., pop., 11,744). <sup>6</sup> Includes the dependent island of Ascension (34 sq. mi., pop., 159), the islands of Tristan da Cunha, Gough, Nightingale, and Inaccessible became dependencies of St. Helena on Jan. 12, 1938. <sup>7</sup> 1938 census.

ated by the British Government for immediate development purposes in the British West Indies (q.v.). The colony contributed toward the British war effort by raising two detachments of volunteers for service overseas and forming three volunteer units for local defense purposes. A self-sufficiency program to lessen the colony's dependence upon foreign sources of supply was carried forward as a result of the disruption of normal trade by the war.

See **BRITISH WEST INDIES** under *History*.

**BRITISH HONDURAS.** A British crown colony in Central America. Area, 8598 square miles; population (1938 estimate), 57,767. During 1938 there were 2052 births, 1178 deaths, and 447 marriages. Capital, Belize (16,687 inhabitants in 1931).

**Production and Trade.** Mahogany, chicle, bananas, grapefruit, cedar logs, coconuts, and copra are the important products. Forest products represented about 80 per cent of the exports by value. Trade (1939): Imports, \$3,532,059; exports, \$2,519,674 (mahogany, \$1,062,993; chicle, \$722,874; bananas, \$186,702). Shipping entered and cleared the port of Belize during 1938 totaled 519,481 tons. There is an airplane service for passengers and freight to Honduras, Guatemala, and other southern points.

**Government.** Finance (1938): \$1,740,602 for total revenue and \$1,872,413 for total expenditure; public debt (Dec. 31, 1938), \$3,337,210. The control of the government is in the hands of a governor who is aided by an executive council. There is a legislative council consisting of the governor as president, 5 official and 8 unofficial members (2 nominated and 6 elected). Governor and Commander-in-Chief, J. A. Hunter (appointed Nov 18, 1939).

**History.** The British Colonial Office early in 1940 agreed to open an area in the foothills of the Maya Mountains in British Honduras to settlement by refugees who left Germany, Austria, and Czechoslovakia previous to the outbreak of the European War. In an agreement reached with the Refugee Industrial Settlement of New York, the government undertook to provide a house and about 10 acres of land to each family in return for a \$600 family entrance fee. Nearly 100 homes were completed before the end of 1940. The settlers planned to engage in wood carving, cabinet making, forestry, tobacco growing, embroidery, and lace-making on a co-operative basis. Legislation passed during 1940 levied an additional war surtax on incomes, ranging from 25 to 75 per cent on incomes over \$3000. Also see **GUATEMALA** and **BRITISH WEST INDIES** under *History*.

**BRITISH MALAYA.** The British possessions and dependencies in Malaya, with their areas, latest populations and capitals, are shown in the accompanying table.

The combined population of the Federated Malay States, Straits Settlements, and the Unfederated Malay States at the end of 1939 was 5,444,833, including 2,332,058 Chinese, 2,259,331 Malays, 744,283 Indians, 30,319 Europeans (including the military which was later increased), and 19,046 Eurasians. Populations of the chief cities were: Singapore, 520,164 (1937); George Town, 149,408 (1936); Kuala Lumpur, 136,068 (1937); Johore Bahru, 97,634; Ipoh, 64,343 (1937); Malacca, 43,258; Taiping, 38,719; Seremban, 27,839; Klang, 27,498; Alor Star, 25,000; Kuching, 25,000.

**Production.** The principal products in 1939 were

rubber (419,000 metric tons shipped), tin (54,000 metric tons), copra (146,800 metric tons, net exports), rice (340,000 tons), palm oil (60,700 metric tons, net exports), iron ore (1,260,000 metric tons, metal content), tea (1,553,094 lb). Other products: Sugar, areca nuts, timber, resin, palm-kernel oil, phosphate, and manganese. The 1939 area of British Malayan (including Brunei and British Borneo) tappable rubber amounted to 1,852,934 acres. Of the world's total shipments of rubber during 1939, British Malaya shipped 36.6 per cent.

<i>Division</i>	<i>Sq. M.</i>	<i>Population</i>	<i>Capital</i>
British North Borneo	29,500	299,000 <sup>1</sup>	Sandakan
Brunei	2,226	35,963 <sup>1</sup>	Brunei

<i>Perlis</i>	316	55,446	Kangar
<i>Trengganu</i>	5,050	201,370	Kuala Trengganu

<sup>1</sup> 1938 estimate    <sup>2</sup> 1939 estimate    <sup>3</sup> Includes Dindings    <sup>4</sup> Includes Province Wellesley    <sup>5</sup> Includes Cocos (Keeling) and Christmas Islands

**Trade.** Federated Malay States, Straits Settlements, and Unfederated Malay States (1939): Imports, \$624,552,000; exports, \$748,505,000 (\$5 averaged \$0.5125 in 1939). Singapore is one of the most important oil-shipping centers of the East. During 1939 some 766,000 tons of liquid fuel and 488,852 tons of gasoline and benzene were imported. Of these amounts 224,754 tons of liquid fuel and 356,736 tons of gasoline and benzene were re-exported. The 1939 trade of British North Borneo, Brunei, and Sarawak (not included in above figures): Imports, U.S. \$15,914,000; exports, U.S. \$26,073,000. During 1939 a total of 12,930 ships aggregating 31,647,614 net tons entered and cleared the port of Singapore.

**Finance.** Federated Malay States budget (1940): Balanced at \$68,698,983. Straits Settlements budget (1941): Revenue, \$46,294,000 (\$43,300,000 in 1940); expenditure, \$57,292,000 (\$61,000,000). Unfederated Malay States (actual 1938-39 figures for Kedah and Perlis, actual 1938 figures for Johore, Kelantan, and Trengganu): Revenue, \$30,729,206; expenditure, \$31,730,903. British North Borneo, Brunei, and Sarawak (actual 1938 figures): Revenue, \$8,661,313; expenditure, \$7,610,238. The average exchange value for the Straits dollar (\$) was \$0.4698 for 1940; \$0.5174, 1939, \$0.5692, 1938.

**Government.** The Governor of the Straits Settlements also serves as High Commissioner for the Federated and Unfederated Malay States and Brunei and as Agent for British North Borneo and Sarawak. The Straits Settlements constitute a crown colony; it is administered by the Governor with the aid of executive and legislative councils. The other Malay States are all protectorates with different degrees of British control. British Residents advise the rulers of each of the Federated and Unfederated Malay States. The Federated Malay States have, in addition, a Federal Council

and their policy in Federal matters is co-ordinated by the High Commissioner through the Federal Secretary. British North Borneo is administered by the British North Borneo Company under a royal charter. The Sultan of Brunei in 1906 agreed to place the administration in the hands of a British Resident. Sarawak has a British hereditary ruler or rajah, Sir Charles Vyner Brooke, but a Special Commissioner represents the Governor of the Straits Settlements. Governor at Singapore in 1940, Sir Thomas Shenton Whitelegge Thomas.

**History.** British Malaya assumed far-reaching importance to the British war effort during 1940. Following the defeat of France and Japan's threatening advance in southeastern Asia, the defenses of the great fortress and naval and air base at Singapore were hurriedly strengthened. During the latter half of the year large reinforcements arrived from India, China, and Australia, including a number of Australian air units. Shipments of heavy bombers came from the United States and the Near East. On November 13 London authorities appointed Air Chief Marshal Sir Robert Brooke-Popham to the newly established post of Commander in Chief in the Far East, with headquarters at Singapore. He assumed command of Empire forces in Malaya, Burma, Hong Kong, and the East Indies.

The local defense resources of Malaya were mobilized also. Compulsory service for Europeans in the Straits Settlements and Federated Malay States was adopted early in the summer and male British-Europeans were not permitted to leave the colonies without a special permit. Later a local defense corps, modeled on the Home Guard in Britain, was organized in each of the Malay States; it was composed of white British subjects over 41 years of age and non-European British subjects and British-protected persons from 18 to 55 years old who had had training in the use of arms.

According to the Governor of the Straits Settlements, British Malaya's financial contribution to the British war effort during the first year of the conflict averaged about £1 per capita for the entire population. The Malayan governments turned over about £2,500,000 while popular contributions included £470,000 for the purchase of bombers and £200,000 to war charities. Later in the year the Straits Settlements and Federated Malay States floated war loans of \$25,000,000 and \$20,000,000, respectively (£5,250,000 in all). The money subscribed was turned over to the British Government for war purposes. A far greater contribution was made through rapidly expanding sales of rubber and tin to the United States, bringing the British Treasury more than £60,000,000 annually in dollar exchange which was urgently needed for the purchase of British war supplies in America.

Economic control measures were adopted to insure the most effective utilization of the region's material and financial resources in support of Britain. In connection with the food control program, a rice pool was established August 1, covering all rice imported into Singapore. Exchange control was tightened to conserve needed foreign exchange. Quotas were imposed on exports of rice, milk, and other foods. War taxes were increased in most of the States.

Rapidly rising prices, combined with agitation by alleged Communists and other subversive elements, provoked recurrent strikes and labor disturbances. On July 18, the authorities introduced compulsory arbitration of labor disputes and a

number of alleged agitators, mostly Chinese, were deported or imprisoned. On November 22, the press attaché of the Japanese Consulate at Singapore was convicted of espionage and sentenced to three years' imprisonment.

On Jan. 23, 1940, the Rajah of Sarawak, Sir Charles Vyner Brooke, issued a decree disqualifying his 27-year-old nephew, Anthony Brooke, as heir presumptive to the throne.

\* The island of Dominica was transferred from the Leeward Islands to the Windward Islands, effective Jan. 1, 1940. <sup>b</sup> 1938 figures.

Agriculture is the main occupation in virtually all of the islands, the chief crops being sugar (exports estimated at 502,086 tons for 1939-40), cacao, coconuts, cotton, citrus fruit, vegetables, and in Jamaica bananas. The tourist business, manufacturing for local consumption, and (in Trinidad) the production of petroleum and asphalt are the other leading sources of income. There is no unified governmental system, the island groups listed above constitute separate colonies, each with a governor appointed by the Crown and with varying degrees of popular representation in their legislative bodies. See the separate article on each colony and its main subdivisions.

**History.** On Feb. 20, 1940, the British Government made public a summary of the report of the Royal Commission headed by Lord Moyne which was appointed on Aug. 5, 1938, to investigate social and economic conditions in the British West Indies, British Guiana, and British Honduras and submit recommendations for measures to improve them. The need for such action was indicated by the development of unrest, labor troubles and mi-

nor disorders in a number of the West Indian colonies (see JAMAICA and TRINIDAD AND TOBAGO in 1938, 1939, and 1940 YEAR BOOKS).

The British Government published at the same time a White Paper setting forth its policy with respect to both the British West Indies and the colonial empire as a whole. In the White Paper the government accepted the Royal Commission's proposal for the establishment of a central organization headed by a comptroller and staffed with technical officers to plan the co-ordinated development of welfare services throughout the British West Indies. It also accepted a recommendation for the appointment of an inspector-general of agriculture for the West Indian colonies. These activities were to be financed from the British Government's Exchequer on a scale approximating the Commission's recommendations. (The Commission called for an annual grant of £1,000,000 for a period of 20 years, to be spent for social services and development alone.) A special sum of £350,000 was set aside for an immediate start on employment-creating projects in Jamaica and British Guiana and on other parts of the program. The government announced that it was consulting the West Indian Administrations on the Commission's other recommendations with a view to prompt action.

The other recommendations included: Improvement of educational, public health, and housing facilities; legislation freeing unions of legal responsibility for damages resulting from strikes, permitting peaceful picketing, and providing for compulsory registration of trade unions and audit of their funds; action by colonial governors and legislatures to improve wages and conditions of labor, etc.; reorientation of the agricultural system in the direction of permanent mixed farming; a land settlement program; improvement of shipping and other communications; and measures to make the colonial legislatures more representative, with universal adult suffrage as the object of policy. The Commission rejected proposals for political federation of the British West Indies, but urged union of the Leeward and Windward Islands as "a practical test of the advantages of federation."

It recommended that the colonial governments "adopt a much more positive policy of bringing their point of view before the mass of the people" and urged "an organized attempt to prevent any further extension of color prejudice."

In July Sir Frank Stockdale, an experienced official of the British Colonial Office, was appointed to the newly created post of Comptroller for Development and Welfare in the West Indies. The post of Inspector-General of Agriculture went to A. J. Wakefield, former Director of Agriculture in Tanganyika. Other experts were named to the Comptroller's staff.

In a move to protect the interests of the West Indian colored populations in connection with possible changes in the status quo of that region, British West Indians in New York City organized an emergency committee on the eve of the Havana Conference (see PAN AMERICANISM). They sent a representative to Havana to insist on the Caribbean peoples' right to self-determination and self government, and this was tacitly recognized in the program adopted by the conference. Subsequently a permanent West Indies National Council, headed by W. A. Domingo of Jamaica, was formed on which most of the British West Indian colonies, including those of British Guiana and British Honduras, were represented.

The West Indies National Council joined with the Jamaican People's National party in a campaign to prevent racial discrimination, segregation, importation of foreign unskilled labor, and foreign interference in local economic and political matters in connection with the leasing of United States bases in British West Indian possessions. The Council supported the British cause in the European War and most of its members were said to favor eventual self-government for the West Indian colonies as units of the British Empire. All of the governments and populations of the individual colonies rallied loyally to the support of the British cause.

For the Moyne Commission's recommendations concerning individual colonies and their respective war contributions, see BARBADOS, BRITISH GUIANA, BRITISH HONDURAS, JAMAICA, LEEWARD ISLANDS, and WINDWARD ISLANDS under *History*. For details of the U.S. naval and air bases, see ANTIGUA, BAHAMAS, BRITISH GUIANA, JAMAICA, ST. LUCIA, and TRINIDAD under *History*.

**BROADCASTING STATIONS.** The tables on page 93 list the larger broadcasting stations, the facsimile broadcasting stations, and high frequency broadcasting stations of the United States. For an account of the number of stations licensed and other events of the year, see FEDERAL COMMUNICATIONS COMMISSION. See also RADIO, RADIO PROGRAMS.

**BROOKINGS INSTITUTION.** An organization devoted to public service through research and training in the social sciences. Established in Washington, D.C., in 1927, it maintains as operating units the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had at least two years of graduate work are accepted as research fellows.

In carrying out its purpose to aid constructively in the development of sound national policies without regard to the special interests of any group, whether political, social, or economic, the Institution conducted during 1940 several significant investigations. The resulting studies were published under the following titles: *Capital Expansion, Employment and Economic Stability; Federal Control of Expenditures, Labor Relations in the Automobile Industry; The Federal Financial System, Wartime Control of Prices; Union Policies and Industrial Management, Productivity, Wages, and National Income, Federal Regulatory Action and Control; Government and Economic Life (Vol. 2), How Nazi Germany Has Mobilized and Controlled Labor.*

The Institution is supported from endowment funds and annual grants. The officers of the board of trustees for 1940-41 were: Chairman, Dwight F. Davis; vice chairman, Dean G. Acheson; president, Harold G. Moulton; treasurer, Henry P. Seidemann, and secretary, Elizabeth H. Wilson. Headquarters are at 722 Jackson Place, Washington, D.C.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** One of America's oldest and largest institutions for informal education, located in Brooklyn, N.Y. Its public activities are conducted at four centers: The Institute at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 7000 and is open to everyone.

The Institute at the Academy of Music presents an adult education program annually of concerts, lectures, forums in every major field of the arts and sciences, and courses of instruction in art, photography, and foreign languages. Approximate attendance at these events for the season 1939-40 was 230,000. The Institute's Museums possess collections in art, ethnology, and natural science. The Central Museum reference library contains more than 27,000 volumes as well as many pamphlets and complete sets of rare periodicals. It includes the Stewart Culin Library on Ethnology and the Charles Edwin Wilbour Library on Egyptology. Attendance at both Museums for the year 1940 totaled 513,800. The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. The Botanic Garden reference library has over 25,000 volumes and pamphlets. Botanic Garden attendance for the year 1940 totaled 1,687,564.

In 1940 the permanent funds of the Institute amounted to \$4,335,000 and the funds to meet current expenses, to \$881,000. Under a general reorganization plan adopted in April, 1938, James G. McDonald was named president of the Institute. Other officers are: Edward C. Blum, chairman of the board of trustees; Julius Bloom, associate director of the Institute at the Academy of Music; Laurance P. Roberts, director of the Museums; Mrs. William Lloyd Garrison, 3d, curator-in-chief of the Children's Museum; C. Stuart Gager, director of the Botanic Garden. Executive offices are located in the Academy of Music, 30 Lafayette Avenue, Brooklyn.

**BRUNEI.** See BRITISH MALAYA

**BRUNSWICK.** See GERMANY under *Area and Population*.

**BUDGET.** For national budgets, see BUDGET, BUREAU OF THE; PUBLIC FINANCE; the countries under *Finance*. For family budget studies, see LIVING COSTS AND STANDARDS

**BUDGET, Bureau of the.** The Bureau of the Budget became a part of the Executive Office of the President at the beginning of the fiscal year 1940. Created by the Budget and Accounting Act of 1921 as a Bureau in the Treasury Department to assist the President in the performance of the duties imposed upon him by the Act, it was transferred by Reorganization Plan I to the Executive Office of the President, wherein are lodged the five agencies assisting the President in the overall management and central direction of the executive branch of the Federal Government. The functions of the Bureau and of the other Divisions of the Executive Office were further defined by Executive Order on Sept. 8, 1939. In actively assuming its new role in the Executive Office of the President, the staff of the Bureau has been expanded and its internal structure crystallized into five major Divisions under the Director and Assistant Director—Estimates, Legislative Reference, Administrative Management, Fiscal, and Statistical Standards (formerly the Central Statistical Board).

The best-known function of the Bureau of the Budget is the formulation of the Budget document which the President annually submits to Congress. In this document are set forth in summary and in detail the proposed fiscal program of the Government for the coming year, with comparative figures as to past and current programs. After the budgetary program becomes operative through ap-

propriations made by Congress (see UNITED STATES under *Legislation*), the Bureau takes up the task of supervising and controlling its execution by a continuous review of expenditures and operations of the various agencies.

The Bureau is also concerned with the improvement of administrative management and organization in the Federal agencies and establishments. It assisted the President in the development of Reorganization Plans III, IV, and V, which were approved by the Congress during 1940. Toward the end of the year, particular attention was given to problems of national defense organization. Continuous effort is being directed toward the improvement of fiscal and budgetary administration in the Federal Government. A step in this direction was the issuance of an Executive Order in August, 1940, having to do with the improvement of financial reporting and budgetary control.

An additional responsibility of the Bureau of the Budget is to keep the President informed of the progress of activities of the agencies of the Government with respect to work proposed, work actually initiated, and work completed. This activity has become particularly important with respect to the defense program. The Bureau likewise assists the President by clearing and co-ordinating the reports of departments and agencies on proposed legislation and by making recommendations as to action on legislative enactments; it also clears proposed Executive orders and proclamations. Efforts to improve and co-ordinate the statistical services of the various Federal establishments are also centered in the Bureau.

In addition to these activities, the Bureau of the Budget, as a staff arm of the President, is frequently called upon for assistance in analyzing and collecting information on a wide variety of administrative problems that arise in day-to-day operations in the Federal Government. See also PUBLIC FINANCE.

HAROLD D. SMITH

**BUHL FOUNDATION.** See BENEFACTIONS under *Foundation Activities*.

**BUILDING.** Home building activity in the fall and winter of 1940 as reported by the Federal Housing Administration (q.v.) closely approached the spring peak. The FHA stated that one half of all the new single-family homes built in 1940 were financed under its program, and were required to measure up to its standards. During the first 11 months of 1940 new home mortgages selected for appraisal numbered 202,039 and amounted to \$930,-158,830 a gain of 31 per cent in number and 26 per cent in amount over the same period of 1939. Property modernization and improvement loans insured by the FHA in 1940 set a new high record, totaling \$280,000,000 as compared with \$233,067,349 of 1939.

Production of single-family homes in the United States during 1940 was close to the average number built annually during the 1920-29 decade, and will be the highest in 12 years, according to a report from the FHA. The total number of single-family homes built approached the 1920-29 annual average of 427,000. In 1928, the last year in which the current volume was exceeded, the total number of single-family homes built was 436,000. In 1933, the year before passage of the National Housing Act, only 39,000 single-family homes were built.

Rents and vacancies in apartment houses for the United States as a whole, have remained, so re-

ports the Federal Home Loan Bank Board, practically unchanged over almost three years, evidence that the newly built dwelling units could be absorbed without inroads into the occupancy and rent structure. Local statistics compiled by the Department of Labor for 32 industrial cities by and large confirm the movement of national indices. However, a number of cities reported lower rents and higher vacancies for apartments due to local overbuilding in this type of dwelling and to the movement of families from apartments in central districts to single-family houses in suburbs.

In slum sections of New York, Philadelphia, Chicago, and other large cities, tenement houses and old buildings were torn down, and there were erected through Federal aid large, modern, low-rent apartment houses. Late in 1940 there was increased industrial building activity, particularly by plants engaged in the manufacture of aircraft and war equipment and others engaged in shipbuilding. The calling out of the National Guard and the drafting of men for service in the army necessitated the putting up of barracks in many parts of the country, and modernizing others that had not been used since the World War.

The defense program, according to F. W. Dodge Corporation's construction outlook, will dominate 1941 construction and industrial production. Increased industrial production will bring about increased employment, purchasing power, and national income, which in turn will tend to increase demand for private construction. As to construction facilities, contractors have not been employed to capacity within the past ten years, so they should be able to handle a program substantially larger than that of 1940. As to building costs, after considering various economic phases, it is assumed that during most, if not all, of 1941 they will be kept within moderate bounds. The table at the foot of this page gives the value of construction contracts for 1939, with estimates for 1940 and 1941.

The building industry in 1940 set a new peak during the past decade according to Dun & Bradstreet, Inc. Building permits for the entire year 1940 for 215 cities in the United States had a total valuation of \$1,362,666,270, or 9.8 per cent more than the \$1,240,813,598 for the preceding twelve

months. With all sections except in the Middle Atlantic and West Central sharing in the rise, the volume of contemplated construction during last year reached the highest figure since 1930. Excluding New York City, the gain over the previous year amounted to 13.4 per cent. The record of building permit values for the twelve months of 1940 and 1939 for 215 cities, as compiled by Dun & Bradstreet, Inc., follows:

<i>Divisions</i>	<i>1940</i>	<i>1939</i>	<i>Change %</i>
New England	\$85,642,592	\$75,147,690	+14.0

\* Based on ten months data, compiled by F. W. Dodge Corp

**BULGARIA.** A Balkan monarchy. Capital, Sofia. King in 1940, Boris III, who succeeded to the throne Oct. 3, 1918

**Area and Population.** Including 2982 square miles of Southern Dobruja, with a population of 378,344, annexed from Rumania on Sept 7, 1940, Bulgaria has an area of 42,797 square miles and a population estimated at 6,720,000. Estimated population of Sofia (with suburbs) in 1937, 350,000; of other cities in 1936: Plovdiv (Philippopolis), 125,000; Varna, 75,000; Ruse (Ruschuk), 51,000, Burgas, 30,000

**National Defense.** The military restrictions imposed upon Bulgaria by the Treaty of Neuilly in 1919 were removed July 31, 1938. As of November, 1940, there were an estimated 350,000 men under arms, not including the air force of 3200 men, and 320,000 trained reserves. The defense force was relatively weak in modern armaments, but this deficiency was being made up rapidly with German aid

**Education and Religion.** At the 1934 census 20.4 per cent of the males and 42.8 per cent of the females were illiterate. Schools of all classes numbered 7782, with 1,086,849 students, in 1937-38 (including 5335 elementary schools with 659,633 pupils). The 1934 census showed 5,128,890 members of the Orthodox Church of Bulgaria, 821,298 Moslems, 48,398 Jews, 45,704 Roman Catholics, 23,476 Armenian-Gregorians, and 8371 Protestants

**Production.** About four-fifths of the population live by agriculture and fishing. The National Bank estimated national income for 1939 at 51,800,000,000 leva, divided as follows (in millions):

Agriculture, 29,000; manufacturing, 4150; salaries and pensions, 4500; commerce, 3700; artisans, 3150; real estate, 2900; transportation and communications, 1700; banking and insurance, 1500. Production of cereals in 1940 was estimated at 3,400,000 metric tons (3,560,000 in 1939), leaf tobacco, 40,000 tons, rose oil, 1600 kilograms, cotton, about 14,000 tons, beet sugar, 30,000 tons; raw silk, 19,200 tons (1939). Other production in 1938 was (in metric tons): Lignite, 1,941,000; coal, 145,000; cement, 194,000; salt, 77,000

**Foreign Trade.** A law published June 1, 1940, established a Foreign Trade Administration to organize and control both imports and exports and direct commercial policy. Imports in 1939 were valued at 5,196,747,000 leva (4,934,193,000 in 1938); exports, 6,064,754,000 (5,578,341,000). Of the 1939 imports, Germany supplied 65.5 per cent, with Italy, Poland, Bohemia-Moravia, and Rumania next in order. Germany took 67.8 per cent of Bulgaria's 1939 exports (58.9 in 1938), with Italy, Poland, the United States, and Bohemia-Moravia following in order. See TRADE, FOREIGN

**Finance.** Ordinary budget returns for 1939: Receipts, 8,281,292,506 leva; expenditures, 8,001,462,279; surplus, 279,830,227. The separate State railways budget showed actual receipts of 1,937,869,572 leva; expenditures, 1,771,464,013. For 1940, ordinary budget estimates were: Receipts, 8,472,018,000 leva, expenditures, 8,461,754,000. Total public debt on June 30, 1939, was 21,751,213,181 leva (foreign, 12,945,525,685; internal, 8,805,687,496). Nominal average exchange value of the lev in first half of 1939 was \$0.0121 (\$0.0124 in 1938).

**Transportation.** In 1939 Bulgaria had 2129 miles of railway line, all State-owned, 16,354 miles of highways; and air lines connecting with the principal European cities. The State railway budget for 1940 balanced receipts and expenditures at

2,185,600,000 leva. A new Sofia-Moscow air line was opened in March, 1940. Freight handled at Danube and Black Sea ports of Bulgaria in 1939 was estimated at 990,000 metric tons.

**Government.** The Constitution of 1879 remained suspended from the Georgiev coup d'état of May 19, 1934, through 1940. All political parties were dissolved in 1934 and the formation of new ones was prohibited. King Boris ruled as virtual dictator after overthrowing Premier Georgiev's dictatorship on Jan 22, 1935. The parliaments elected in March, 1938, and in December, 1939-January, 1940, were deprived of practically all legislative powers. The former political parties were not permitted to present candidates or otherwise participate in the electoral campaigns. Deputies were elected on a personal basis and government manipulation of the electoral machinery produced pro-government majorities. See *History* for 1940 developments.

### HISTORY

**Southern Dobruja Recovered.** Bulgaria utilized the Balkan crisis precipitated by the Soviet Government's forcible annexation of Bessarabia and Northern Bukovina from Rumania (qv) late in June, 1940, to win back Southern Dobruja, which was taken from Bulgaria by Rumania after the Second Balkan War of 1913. Under the agreement signed in Craiova, Rumania, between Rumanian and Bulgarian delegations on September 7, Bulgaria received 2982 square miles of territory with 378,344 inhabitants, including about 78,000 Rumanians. An exchange of these Rumanians for some 91,000 Bulgarians remaining under Rumanian jurisdiction was provided for.

Courtesy of New York Times

### TRANSFER OF SOUTHERN DOBRUJA

The provinces of Durostor and Caliacra forming Southern Dobruja (the striped area), restored to Bulgaria by Rumania under the treaty of Sept 7, 1940. Rumania annexed Southern Dobruja after the Second Balkan War of 1913.

The transfer was peacefully negotiated as a result of German and Italian diplomatic pressure upon Rumania, coupled with Rumania's fear that the Bulgarians would seize all of the Dobruja by force if the claim to the southern sector was not granted. Clashes between Rumanians and Bulgarians in the territory multiplied preceding the negotiations and Rumania on July 19 agreed to the formation of a mixed commission to investigate the treatment of the Bulgarians in the disputed region. Bulgarian civil officials entered Southern Dobruja on September 15 and Bulgarian troops occupied it in four stages between September 21 and 31. Compulsory exchange of minority populations was scheduled for completion within three months. Bulgaria undertook to pay Rumania a blanket sum of 450,000,000 leva as compensation for improvements made in Southern Dobruja by the Rumanians and in settlement of all other claims. Rumania agreed to pay Bulgarians in both Northern and Southern Dobruja for losses from requisitioning by the Rumanian army.

All these provisions of the transfer agreement were approved by a special session of the Bulgarian National Assembly on September 21. In a manifesto issued the same day King Boris asserted that the cession had eliminated seeds of future quarrels. However, resentment was subsequently expressed in Bulgaria at the alleged unfriendly treatment accorded Bulgarian evacuees from Northern Dobruja leaving Rumania under the population exchange agreement. Extreme nationalist circles in Bulgaria began to advocate the annexation of Northern Dobruja.

**Other Territorial Claims.** Ten days after the Dobruja treaty was signed, the Sofia press began a campaign for the satisfaction of Bulgaria's territorial claims on Greece (see *YEAR BOOK*, 1939, p. 99). Later the Sofia Government made formal representations to Athens on the matter, without securing satisfaction. The Bulgarians attempted to utilize the Italian invasion of Greece to obtain their objective. Eleven hours after the Italian invasion began, King Boris on October 28 indicated that Bulgaria was ready to abandon its previous policy of "peace and neutrality" if a favorable opportunity for intervention in Greece presented itself. This policy was balked by the Greek repulse of the Italian invasion and by warnings from Turkey and Yugoslavia that they would fulfill their obligations under the Balkan Pact and join in the military defense of Greece if Bulgaria attacked that country. The establishment of British air bases in Greece within bombing range of Bulgarian cities was another deterrent.

The question of the Bulgarian claims against Yugoslavia was allowed to lie dormant by the government pending an adjustment with Greece. However the issue was brought up in the National Assembly at Sofia early in December by a government deputy, causing a strain on Yugoslav-Bulgarian relations. The controlled press in Belgrade took the position that Bulgaria had renounced her claims in 1928 and that no discussion of the matter was possible.

**The German Menace.** The Sofia Government expressed its gratitude to the Reich for Hitler's aid in the Dobruja deal. It ardently hoped that German collaboration would enable Bulgaria to regain the lost territories from Greece and Yugoslavia in the same fashion. But it was even more desirous of avoiding the fate of Rumania, Hungary, and Slovakia, which had accepted Hitler's aid only to be-

come his vassals. Nor had it any desire to become the battleground of all the warring European nations. Consequently Bulgaria extended its close co-operation with Germany in both economic and diplomatic affairs during 1940, but withstood pressure both from Berlin and from pro-Nazi elements in Bulgaria to join the Rome-Berlin-Tokyo alliance.

During a conference with Hitler on November 17 King Boris was reported to have side-stepped the German offer of an alliance by stating that his government could not accept unless Russia also entered the Axis bloc or specifically approved Bulgaria's adhesion. Russia, however, opposed Bulgaria's entry into the Axis and Turkey on November 22 increased her military preparations along the Bulgarian frontier. The Turks threatened to enter the war if Bulgaria permitted German troops to pass through its territory to attack Greece. These dangers were enhanced by the concentration of large numbers of German troops in Rumania along the Bulgarian frontier in December. Despite a German offer of November 19 to aid Bulgaria's recovery of her former Aegean outlet, Boris and his Ministers affirmed their determination to remain neutral and to avoid the establishment of "foreign regimes" in Bulgaria. On December 26 it was reported that Boris had dismissed 27 high-ranking army officers who urged entry into the war on the side of the Axis.

Nevertheless Germany by the end of 1940 had established virtually complete economic domination of Bulgaria. On June 20 a German-Bulgarian cultural and educational convention was signed. In July several thousand Bulgarian peasants and workmen were sent to Germany to relieve the labor shortage. A new German scientific institute was opened at Sofia in October. In December a German purchasing combine contracted to purchase the unsold remainder of Bulgaria's 1939 tobacco crop plus about half the 1940 crop—a total of 40,000,000 to 50,000,000 kilograms valued at 3,000,000,000 to 4,000,000,000 leva. Numerous German officials, business men and "tourists" entered Bulgaria during the year and it was suspected that Berlin was organizing a "fifth column" to align Bulgaria with the Reich at the proper time. Significantly, it was intimated in Sofia late in December that Bulgaria would be unable to resist if German troops demanded a right-of-way through the country.

**Relations with Russia.** In its struggle to resist German domination, the Sofia Government depended primarily upon the clashing interests of Russia and Germany in the Balkans. The rapprochement between Sofia and Moscow initiated in 1939 (see *YEAR BOOK*, 1939, p. 100) was carried farther during 1940. Their collaboration was marked by the establishment of a direct Sofia-Moscow air service in January, the conclusion on January 5 of a three-year trade pact, and Soviet diplomatic support of Bulgaria in her negotiations with both Rumania and Germany. The Communist party in Bulgaria was given much more freedom than in previous years, and it used this opportunity to agitate vigorously for a Soviet-Bulgarian mutual assistance pact that would bring Bulgaria within the Soviet orbit. Such a pact was proposed to the Sofia Government by the Secretary General of the Soviet Commissariat of Foreign Affairs during a conference with King Boris on November 25. Boris rejected this proposal, as well as a Turkish move to form a neutral bloc comprising Bulgaria, Turkey, and Yugoslavia to bar further German and Soviet encroachments in the Balkans.

**British Overtures.** The British Government also made a bid to keep Bulgaria neutral. A government spokesman said in the House of Commons on November 26 that if Bulgaria did not actively or passively assist Britain's enemies, the British Government would strive to insure the integrity and independence of Bulgaria in any eventual peace settlement to which it might be a party. Previously the British Government had indicated that it approved Bulgaria's demand for the return of Southern Dobruja.

**Military Preparations.** Anticipating possible involvement in the war, the government rushed its rearmament program at full speed during 1940. The new mechanized army, equipped mainly with German and British armaments, paraded through Sofia on May 6. A bill for the compulsory military service of all men between 17 and 65 was introduced by the Minister of War on May 25. A supplementary arms appropriation of 900,000,000 leva was voted by the National Assembly September 23. Anti-aircraft equipment from Germany made its appearance in Bulgaria in large quantities in October. A number of reserve divisions were called up for active service late in the year. See above under *National Defense*.

**Internal Politics.** The parliamentary elections held in December, 1939, and January, 1940, increased the Kiosseivanov Government's strength in the National Assembly to 140 out of 160 seats. The Opposition groups retained only 20 of the 56 seats formerly held. Eleven of these new deputies were Communists. The elections were followed by the resignation of Premier Kiosseivanov, who had headed eight successive cabinets since 1935. The King accepted his resignation in order to avoid a split in the government ranks between the adherents of Kiosseivanov and Ivan Bagrianov, majority leader and Minister of Agriculture. The new ministry formed February 16 was headed by Prof. Bogdan Philov, with Ivan Popov holding the important Foreign Affairs portfolio.

The new National Assembly, composed of deputies elected as individuals from nominees hand-picked by the government, convened on February 24 and approved the King's address affirming a policy of peace and neutrality. Although controlling a large majority in the National Assembly, the government was harassed by the rapid growth of Communist influence. Communist propaganda called for a military alliance with Soviet Russia and vigorously opposed the government's pro-German policy. In response to Communist appeals, the King amnestied more than 3000 political prisoners on October 2, the 22d anniversary of his accession to the throne. The government found it necessary on December 28 to launch an intensive campaign to explain its foreign policy to the people. On December 29 Foreign Minister Popov informed parliament that Bulgaria's foreign policy would not be influenced by Communist propaganda.

The government also resisted the clamor of Nazi elements for the transformation of Bulgaria into a totalitarian State on the German model. However some steps were taken in this direction. Government pressure forced the Bulgarian Grand Lodge of Freemasons to dissolve on July 27. A decree issued October 8 barred all national and secret organizations receiving material or ideological support from abroad, placed severe restrictions upon the civil rights of Jews, and barred all anti-national propaganda. This measure was approved by the National Assembly December 20 after a stormy

debate. It was aimed in part at Communist propaganda.

A strike of industrial workers, attributed to anti-national propaganda, was broken on June 26 by an order calling the strikers to the colors. About 150 ringleaders of the strike were arrested and interned in the provinces. Labor unrest was fanned by rapidly rising prices for necessities and the introduction of rationing. This was attributed partly to a bad harvest and partly to German demands for increased shipments of foodstuffs.

**BUND, German-American.** See DIES COMMITTEE; FASCISM.

**BUREAUS, Federal.** See under the descriptive word of each title, as CUSTOMS, BUREAU OF.

**BURIAL ASSOCIATIONS.** See CO-OPERATIVE MOVEMENT.

**BURMA.** A British dependency. Total area, 261,610 square miles comprising Burma proper, with Chin Hills and Kachin Hills Tracts (192,158 sq. mi.), Shan States (62,335 sq. mi.), and unadministered territory (7117 sq. mi.). Total population (Dec 31, 1937, estimate), 15,797,000 compared with (1931 census) 14,667,146 (84.3 per cent Buddhists, 5.2 per cent Animists, 4 per cent Mohammedans, 3.9 per cent Hindus, and 2.3 per cent Christians). Chief cities (1931 populations): Rangoon (capital), 400,415; Mandalay, 147,932; Moulmein, 65,506. Education (1938-39): 8039 recognized schools and colleges (611,938 students) and 19,020 unrecognized schools (213,295 students).

**Production and Trade.** The chief agricultural products are rice, sesamum, maize, jewar (Indian millet), cotton, beans, groundnuts, and grain. A net area of some 17,677,587 acres was sown in 1937-38. The output of rice (rough) from 12,522,900 acres in 1938-39 was 8,173,100 metric tons. Forest reserves covered 31,374 square miles and the output of teak, by lessees, during 1937-38 reached 283,857 tons. Rubber produced in 1939 totaled 7200 metric tons. Mineral production (1939), in metric tons, included petroleum 1,092,000, tin 6000 (metal content), lead 81,600 (1938), zinc, tungsten concentrates 3342 long tons, silver, rubies, jadestone, wolfram, gold, and copper. Trade (1939): imports, Rs224,640,000; exports, Rs529,200,000 (rupee averaged \$0.3328 for 1939).

**Communications.** Railways (1938-39) 2069 route miles, 4,240,394 tons of freight and 18,920,308 passengers carried. The Irrawaddy and its navigable arms form an important artery of commerce. Highways extended 10,530 miles. The Burma Road from the railroad at Lashio in northern Burma to Chungking, China, was an important avenue of supply for the Chinese in their war against Japan.

**Government.** Finance (1938-39 actual): revenue, Rs164,200,000; expenditure, Rs153,800,000. Budget (1940-41): revenue, Rs160,306,000; expenditure, Rs164,660,000. The Government of India Act provided for the separation of Burma from India on Apr. 1, 1937. Executive power is vested in a governor (appointed by the Crown) who is advised by a council of ministers of not more than 10 members. There is a legislature, having power over Burma's internal affairs, consisting of a senate of 36 members (18 elected by the house of

representatives and 18 appointed by the governor) and a house of representatives of 132 members elected by popular suffrage. Large areas in the northern and eastern hill districts were excluded from the legislature's control and placed under the jurisdiction of the governor. Col Sir Reginald Hugh Dorman-Smith was appointed Governor, Dec. 24, 1940, succeeding Sir Archibald D. Cochran.

**History.** Burma was drawn closer to the vortex of the war in eastern Asia during 1940. Japan succeeded in cutting Chinese supply routes through French Indo-China and concentrated her attention on closing the Burma Road to the Chungking Government's vital war trade. Japanese agents fanned the political and religious dissensions that had been chronic in Burma for several years (see preceding YEAR BOOKS). In January and April there were new outbreaks of large-scale rioting between Hindus and Moslems in Rangoon. The nationalist movement for immediate autonomy and eventual independence continued to harass British authorities intent upon mobilizing Burma's resources to aid the Empire's war effort. The cabinet was reorganized on January 20, Premier Maung Pu having eliminated Home Minister U Ba Pe on grounds of disloyalty. After the collapse of France in June, the British Parliament authorized the Governor of Burma to govern without reference to London in the event of the severance of communications with England.

The British Government on July 3 went a step beyond the political promises made in 1939 (see 1939 YEAR BOOK, pp 101-2) and agreed to consider dominion status for Burma when the war had been won. A representative Burman was invited to serve as one of the governor's counselors. This action was in answer to a message from Premier Pu stating that his government's policy of giving the utmost help to Britain could be fully effective only if Burma were granted the same rights as the dominions in respect to defense and foreign relations. The pledge to consider dominion status did not satisfy the extreme Burmese nationalists, who formed a "freedom bloc" under the leadership of ex-Premier Ba Maw. Dr. Maw was arrested on August 6 and sentenced on August 29 to a year's imprisonment on undisclosed charges. At Japanese instigation, the nationalist Misch movement issued a manifesto to the British governor and to the government in London demanding the stoppage of shipments of war supplies to China through Burmese territory.

The Japanese also continued to foment labor disturbances in Burma to hamper shipments to China. By pressure upon the British Government, they succeeded in closing the Burma Road from mid-July to mid-October (see CHINA, GREAT BRITAIN and JAPAN under *History*). The entrance of Japanese troops into French Indo-China also raised the danger of a Japanese military invasion. Beginning in August, the British authorities were reported to be building frontier defenses and installing anti-aircraft defenses at Lashio and other towns in northern Burma.

**BURNS.** See ACCIDENTS; MEDICINE AND SURGERY.

**BUSES.** See AUTOMOBILES; RAPID TRANSIT.

**BUSINESS REVIEW.** Industrial activity in the United States declined during the first four months of 1940, but the trend was reversed in the

latter part of the year and the volume of production rose to a new high record level in the closing months. The initial recession, which carried the revised index of industrial production of the Federal Reserve Board from 122 in January down to 111 in April, represented the usual reaction from the period of active forward buying and inventory accumulation that marked the outbreak of the European war in the fall of 1939. When it became apparent that commodity prices would remain stable and that exports to Europe were not going to increase by leaps and bounds, business men generally became more conservative and displayed a desire to cut down inventories. The German invasion of the Low Countries and the defeat of France, however, made certain the adoption of a very intensive and ambitious national defense program by the United States. By June, the initial effects of the new armaments program already became apparent in industry, many business men launching plans for new capacity and adding to inventories in anticipation of huge Government purchases. During the later months of the year, the placing of billions of dollars of Government defense contracts was the major influence on the course of business activity.

National defense expenditures during the first six months of 1940 averaged only \$145,000,000 per month. By December, such outlays had risen to \$470,000,000 for the month. By the end of 1941, according to the official estimates, national defense spending is to approach a billion dollars monthly. During the closing weeks of the year, therefore, a wide range of industries felt the stimulus not only of actual Government contracts, but of anticipatory plant construction and preparations for such contracts that were expected in 1941. The effects of the national defense program were felt not only by the numerous concerns receiving the contracts, but also by thousands of smaller enterprises that received orders as sub-contractors to provide materials and supplies for the original contractors, while many concerns with excess productive capacity were diverting their facilities to the production of armaments. Manufacturers of railway equipment, for example, took on large orders for tanks and other implements of war. The Office of Production Management and other special agencies of the Government organized during the year to foster defense production were making earnest efforts to mobilize the entire industrial capacity of the nation for defense work as far as feasible.

By the closing months of the year, industry began to reflect the impact of the huge defense program, which called for the expenditure of upwards of \$25,000,000,000, apart from the cost of aid to Britain, within a period of two years or so. The durable goods group of industries expanded their output by leaps and bounds, whereas consumer

goods lines increased their output far more slowly. Because the armament orders went largely to concerns whose productive capacity was already fully employed, a huge volume of industrial construction and machinery purchases became necessary.

The effect of the defense program upon durable and non-durable goods manufacturers is shown by the preceding table, comparing indices of manufactures of each of these two classes compiled by the Board of Governors of the Federal Reserve System.

The course of industrial production during 1940, with comparisons with previous years, was reflected as follows in the revised index of the Federal Reserve Board:

#### INDEX OF INDUSTRIAL PRODUCTION FEDERAL RESERVE BOARD

1928	99	1935	87		

By the end of the year, the industries affected by the armament program were confronted by a basic question as to future policy. There was considerable pressure from Washington for the inauguration of ambitious construction programs to expand capacity. Congress had taken steps to encourage the expansion of armament capacity by amending the Revenue Act to permit amortization of such plant within five years through depreciation

charges against taxable income, disregarding Treasury regulations requiring the spreading of depreciation over a much longer period. However, in such industries as iron and steel it was argued that too much time would be required to construct the new productive capacity, and that the added facilities would constitute a disrupting factor when the defense emergency was over. Resort to priority rules to assure an adequate supply for defense purposes, if necessary, was held the preferable course of action in the iron and steel and other industries. As the scope of defense requirements mounted steadily, especially when a rapid increase in aid to Britain was envisaged, it became apparent that both new construction and priorities would be required in time to meet the vast armament requirements. See NATIONAL DEFENSE ADVISORY COMMISSION, RECONSTRUCTION FINANCE CORPORATION.

The course of industrial activity may be traced from the comparisons of indices for six major industries shown at the foot of this page.

**New Construction.** While residential construction expanded further during the year and approached the 1929 level in the value of contracts awarded, a far more spectacular recovery occurred in industrial and military construction. Key industries, such as aircraft, machine tool, and heavy machinery manufacture, embarked upon large-scale plant expansion programs. Also, the Government rushed work on new army cantonments, military airports, and other defense works. As a result, the total value of non-residential construction contracts by the end of the year had recovered above the 1930 level, despite the continued very restricted volume of commercial building. The Government shifted its interest from slum clearance to the provision of special defense housing, to prevent serious residential shortages in communities in which defense activities were centered. See BUILDING; CONSTRUCTION INDUSTRY.

**Iron and Steel.** Except for a dip in production during the spring and early summer months, the iron and steel industry operated close to capacity levels during 1940. The launching of the enlarged national defense program brought a new steel buying wave during the late summer and early fall,

<sup>a</sup> New Federal Reserve Index, 1935-39 = 100. <sup>b</sup> Federal Reserve Index, 1923-25 = 100.

and operations hovered close to capacity through the final months of the year. A good deal of productive capacity previously retired was returned to active operation, and several major concerns in the industry announced plans for the construction of new open hearth and finishing capacity. Largely due to Government opposition, the industry refrained from advancing its price structure despite the active demand for its products and some increases in costs. See IRON AND STEEL.

**Automobiles.** The expansion in purchasing power brought a sharp increase in automobile sales during 1940, so that production was higher than in any previous year except 1929 and 1937. A total of 4,692,338 cars and trucks was produced in the United States and Canada during the year, which compared with 3,732,718 units produced in 1939. Sales of 1941 model cars were stimulated by fears of price increases, possible artificial restrictions on production in 1941 due to priorities, and expectations that model changes would be few for the 1942 season, in order to permit the diversion of machine tool capacity to defense work. Automobile plants took on a growing volume of defense business late in the year. The Packard Motor Car Company undertook to produce the Rolls-Royce aircraft engine for both the United States and British Governments, while the General Motors Corporation perfected its liquid-cooled Allison engine and also embarked upon other defense work. See AUTOMOBILES.

**Other Industries.** A number of other industries felt the stimulus of the national defense pro-

gram. The demand for lumber increased sharply, chiefly for cantonment construction, and cotton and woolen mills received large orders from the armed services.

Consumer goods industries that were not recipients of defense orders showed smaller increases in production. The table in the preceding column compares the output of a number of industries for 1940, as compared with 1939.

**Minerals.** Mineral production was stepped up sharply during the later months of the year because of the national defense program. This was particularly true of metals, in view of the major role they play in armament manufacture. The Government imposed licensing requirements upon exports of a number of metals, both to conserve supplies for domestic needs and to prevent the flow of strategic materials to the Axis countries.

Domestic consumption of petroleum and its products increased to a new record level during the year, but exports were lower. The industry assured the defense authorities of its ability to produce all the petroleum products needed for the defense program, including greatly increased quantities of aviation gasoline that were to be produced with the aid of new facilities that the industry was constructing for this purpose.

The Reconstruction Finance Corporation (q v) undertook to finance the building up of substantial stocks of strategic imported metals within the United States. The Metals Reserve Company, established for this purpose, acquired large stock piles of tin from the Far East, copper from Chile and other Latin American producing countries, and manganese from Cuba and other available sources.

Indices of domestic minerals production computed by the Federal Reserve Board compared during 1939 and 1940 as shown in the table at the foot of this page. (See also COAL, IRON, ETC.)

**Wholesale and Retail Trade.** The volume of distribution increased to an all-time record level in terms of physical volume, but not dollar value, during 1940. This reflected the rise in national income due to increased armament spending and industrial activity. Moderate increases occurred also in farm income (see AGRICULTURE) and distri-

**Commodity Prices.** Commodity prices declined slowly during the early months of the year, when the disappointing level of exports to the belligerent countries and a desire to reduce inventories led to a curtailment of current buying. The sweep of the German armies across western Europe brought a sharp decline during the summer months, by which time the bulge in the price level incident to the outbreak of the war had been virtually wiped out. The imminent defeat of Great Britain expected at that time occasioned special caution among purchasers in primary markets, as the end of the war was expected to bring a sharp drop in exports, a flood of imports, and a severe downward readjustment in prices of those commodities, trade in which had been disrupted by the conflict. When it became evident that the war would be prolonged, however, and the American defense effort got under way, the price level stiffened and retraced all the ground lost during the first six months in the closing weeks of the year.

Agricultural prices were stabilized through loans made by the Commodity Credit Corporation (q v) to farmers. Owing to the national elections, there was a tendency to liberalize these loans, particularly in the case of corn. The higher corn loan, in turn, led to a curtailment of livestock production and strength in meat prices late in the year.

A major factor tending to stabilize prices of manufactured goods was the activity of the price stabilization division of the Advisory Commission to the Council on National Defense. Leon Henderson, head of this division, repeatedly intervened to discourage price increases in strategic industries. When prices rose in the pulp and paper industry, Mr. Henderson issued a report on prospective supply and demand which halted the rise. Threats of action under the anti-trust laws also were made repeatedly by Mr. Henderson and other Government spokesmen. As time wore on, the Government adopted an increasingly firm attitude in opposing price increases, finally going so far as to threaten price fixing and the taking over of needed supplies at fixed prices under the authority given by the Selective Service Act. Industrialists generally showed a readiness to co-operate with the Government in keeping prices stable, recognizing the danger of a

repetition of the World War spiral of price and wage increases, but insisted that a measure of flexibility should be retained for the price structure to cover circumstances where unavoidable advances in costs made individual increases necessary. At the same time, business men warned that should sweeping wage increases occur, such as those urged by a number of C I O union leaders, it would not be possible to avoid price increases for many products, regardless of the attitude adopted by the Government. Also, the adoption of defense priorities in major industries was expected to produce price increases because of competitive bidding among non-defense consumers for the limited supplies that would then remain available for them.

The index of wholesale prices of the Bureau of Labor Statistics fluctuated as follows during the year:

#### WHOLESALE PRICE MOVEMENT

[1926 = 100]

	Combined Index	Farm Products	Foods	Other Commodities

Retail prices held reasonably stable during the year, although moderate advances occurred in clothing and certain other items in the later months.

Labor union leaders recognized that the cost of living, remaining little changed, did not justify increases in wages, and based their demands rather upon increased productivity per man-hour and larger reported profits.

The movement of major groups of retail prices during 1940, compared with 1939, was as follows, according to the cost of living indices compiled by the National Industrial Conference Board:

## INDICES OF RETAIL PRICES

[1923 = 100]

Mon.	Food <sup>a</sup>		Clothing		Fuel and Light		Total Cost of Living <sup>a</sup>	
	1939	1940	1939	1940	1939	1940	1939	1940

<sup>a</sup> Revised series, based on U S Department of Labor on 1935-39 = 100 basis

**Industrial Earnings.** The increased volume of sales produced larger profits in most industries, particularly those concerned with the manufacture of producers' goods and armaments. While there was some tendency for wage costs to rise, particularly because of greater resort to overtime work, the larger volume of production permitted an offsetting cut in unit costs. However, the two revenue acts of 1940 brought about a sharp increase in the normal corporate income tax and the imposition of an excess profits tax which cut sharply into the earnings of many concerns directly affected by the armament program. As a result, earnings in many cases did not come fully up to expectations in the final quarter of the year, except in the case of such industries as railroads and iron and steel manufacture which, because of their large investment in fixed plant, were not as hard-hit by the excess profits tax as others. The public utilities and many consumer goods enterprises, moreover, suffered a decline in net income for the year because, while receiving little direct benefit from the armament program, they were comparatively vulnerable in many instances to higher corporate income and excess profits taxes.

**Commercial Failures.** The high level of business activity again held commercial failures down to relatively low levels. The number of failures and the liabilities involved compared as follows during 1940 and the preceding year:

## COMMERCIAL FAILURES • BY DIVISIONS OF INDUSTRY

Industry	Number		Current Liabilities (thousands of dollars)	
	1939	1940	1939	1940
Manufacturing	2,919	2,621	71,152	67,585
Wholesale Trade	1,534	1,316	23,942	20,405
Retail Trade	9,050	8,329	67,378	57,329
Construction	646	760	11,031	13,311
Commercial Services	619	593	9,017	8,054
Total	14,768	13,619	182,520	166,684

<sup>a</sup> Dun & Bradstreet

Some progress was made during the year toward consummating the many railroad reorganizations that have been pending for years, but, owing to the

complicated procedure involved, only one, the Chicago & Eastern Illinois Railway, was brought to actual completion by the end of 1940. See RAILWAYS. Progress on public utility holding company simplifications and integrations under the provisions of the Public Utility Holding Company Act of 1935 also was quite slow, particularly because of the increasingly strict stand taken by the Securities and Exchange Commission in passing upon all proposals for conforming with the law emanating from public utility holding companies. Despite many requests from the public utility industry that the application of the Public Utility Holding Company Act of 1935 be suspended during the duration of the defense emergency, to avoid interference with the expansion of power capacity, the SEC insisted upon proceeding with the enforcement of this law and favoring the most strict interpretation of the obscure provisions governing geographical integration of operating subsidiaries of holding companies.

**World Business Trends.** The war brought sweeping changes in business conditions outside the United States also. The continent of Europe was virtually cut off from intercourse with the outside world by the British blockade. Most of the continent became an armed camp, suffering from shortages of foodstuffs and other raw materials and organized chiefly for the production of war supplies for the German military machine. In Great Britain, the more effective German attacks on British shipping and the air raids forced stricter rationing of foodstuffs and other consumers' goods, while every effort was made to maintain military production at a maximum. By the end of the year, however, it became apparent that Britain could continue to fight effectively only with the help of the United States, for liquid resources were rapidly depleted. Efforts were made also to expand arms production in British Empire countries, but owing to their limited previous industrialization only a bare start could be made in this direction.

Japan suffered a further decline in living standards, as the drain of the war with China and restrictions on trade with the United States added to the economic burdens on that country.

The vast cost of the war produced conditions favorable to commodity price inflation in a number of European countries. In France and other countries occupied partly or wholly by Germany, the heavy costs of military occupation were being paid for largely by paper money emissions, which made for price increases despite strict control measures imposed by the government. In Great Britain also the enormous cost of the war was being financed in part by the sale of bonds to the banks, laying the basis for inflationary price increases later. In Italy and Japan similarly, there was a marked tendency for commodity prices to rise despite rigid control measures adopted by the government, owing to the expansion of purchasing power through enormous government spending.

The loss of the continental European market and the need for Great Britain to conserve her rapidly dwindling foreign exchange resources imposed a serious burden upon Latin America. Exports of these countries declined, while they were forced to turn to the United States for many manufactured products formerly purchased in Europe. As a result, their trade balances with the United States became highly adverse, and it became necessary to impose new import restrictions and, in the case of Argentina particularly, there was a considerable

loss of gold to this country. The United States, as part of its hemisphere defense policy, offered to aid Latin American nations during the emergency, and made loans to several countries through the Export-Import Bank (q.v.) and the Stabilization Fund. Consideration was given to the formation of a hemisphere cartel which would store commodities produced in the western hemisphere and sell them abroad whenever feasible, the storage of these products being financed by the United States in the interim. This project was strongly opposed by commercial banks and others who charged that it was tantamount to the adoption of totalitarian trade methods before the need for them had been demonstrated. A measure of relief was given to Latin America by United States purchases of various products for strategic reserves.

Active consideration was given in official circles to far-reaching measures for expanding trade between the United States and other western hemisphere countries, so that the latter would become less dependent upon European outlets, particularly in the event of a German victory and the consequent prospective utilization of economic dependence by the Axis powers to effect political penetration. However, little concrete progress on such a program was registered in 1940.

A review of the agricultural situation is to be found under AGRICULTURE and of labor under LABOR CONDITIONS. See BANKS AND BANKING, COMMODITY EXCHANGE ADMINISTRATION; FINANCIAL REVIEW; LIVING COSTS, MANUFACTURES, CENSUS OF; MARKETING; TRADE, FOREIGN, and separate articles on the branches of industry, as ELECTRICAL INDUSTRIES, GARMENT INDUSTRY, INSURANCE, RAILWAYS.

JULES I. BOGEN.

**BUSINESS SCHOOLS.** See SCHOOLS.

**BUTTER AND BUTTERFAT.** See DAIRY-ING.

**BYELO RUSSIAN SOVIET SOCIALIST REPUBLIC.** Same as WHITE RUSSIAN SOVIET SOCIALIST REPUBLIC.

**CAA.** Civil Aeronautics Authority. See AERONAUTICS.

**CABINET, U.S.** See UNITED STATES under Administration.

**CADMIUM.** This by-product of zinc smelting was priced at 80¢ per lb throughout 1940, compared with an average of about 60¢ per lb in 1939. The principal uses of the metal are in bearings, batteries for submarines, plated hardware, and as pigments in red and yellow lithopones. The importance of Mexican production of cadmium in the United States market was demonstrated in 1940 by the labor strike in Mexico.

H. C. PARMELEE.

**CALIFORNIA.** Area, 158,297 square miles, including (1930) water, 2645 square miles. Population, April 1, 1940 (census), 6,907,387, 1930, 5,677,251. Sacramento, the capital (1940), 105,958; Los Angeles, 1,504,277; San Francisco, 634,536; Oakland, 302,163. California's gain in population (1930-40) came to 21.7 per cent, a rate surpassed in but two States, Florida and New Mexico. Los Angeles gained, in the decade, 258,744 inhabitants, a greater number than any other city in the Union, save New York.

**Agriculture.** The harvest of 1940 covered 5,755,000 acres of California's main field crops; but this did not include acreage in orchards and

vineyards, the sources of much of the agricultural return. The year's indicated crop of oranges, 48,-287,000 boxes, was estimated as having a value, to the growers, of \$49,010,000. Lemons yielded about 13,430,000 boxes (estimated at \$18,936,000), grapes, 2,186,000 tons (\$33,986,000); peaches, 22,418,000 bu (\$11,609,000); pears, 9,543,000 bu. (\$5,426,000). Among field crops, tame hay, on 1,565,000 acres, made 4,657,000 tons (\$37,256,000); cotton, on 348,000 acres, with a large average yield of 723 lb to the acre, the Union's highest for 1940, produced 525,000 bales (\$25,462,000); barley, 1,197,000 acres, 33,516,000 bu. (\$12,401,000); potatoes, 75,000 acres, 22,740,000 bu. (\$16,900,000); dry beans, 374,000 acres, 5,492,000 100-lb bags (\$17,216,000); wheat, 758,000 acres, 11,370,000 bu. (\$8,755,000); rice, 118,000 acres, 8,968,000 bu. (\$5,560,000); sugar beets, 173,000 acres, 2,791,000 tons (the crop of the previous year had a farm value of \$13,346,000). The value of truck crops for 1940, combined, attained \$84,811,000.

**Mineral Production.** California's yearly production of native minerals, as given in the *Minerals Year Book* of 1940, totaled \$489,948,802 for 1938. Petroleum, natural gas, and gasoline derived from natural gas furnished nearly four-fifths of this total, gold made up much of the remainder; cement, clay products, and borates also counted as considerable factors.

The yield of the petroleum wells declined to 224,354,000 bbl approximately, for 1939, from 249,749,000 (value, \$257,250,000) for 1938. The drop was attended by a diminution of the export market, but a stronger domestic demand offset this and cut into the stock of petroleum on hand. Efforts at effectual curtailment of output continued despite a popular vote against a measure for compulsory regulation. The production of the great Kettleman Hills district dropped, for 1939, by some 6,000,000 bbl, but four new fields were discovered in Kern and Fresno counties. The yield of natural gas, 370 billion cu ft, almost equaled that of 1938. Of 1938's total, 315,168 million cu ft was delivered to consumers and was valued at \$88,225,000 at points of consumption. Gasoline extracted from natural gas attained 606,631,000 gal for 1939, as against 660,890,000 (value, \$41,085,000) for 1938. Producers' shipments of cement rose to 11,293,989 bbl (\$15,889,395) for 1939, from 10,539,010 bbl (\$15,689,210) for 1938. Clay products (except pottery and refractories) totaled \$6,636,860 for 1938. The output of borates (including a small component from Nevada) rose to 249,976 short tons (\$5,882,302) for 1939, from 219,513 tons (\$4,570,316) for 1938. A well dug for petroleum, near Brawley, struck in November, 1940, a huge initial flow of 1,000,000 cu ft a day of carbon dioxide gas.

The production of gold, silver, copper, lead, and zinc was valued at \$52,528,081 for 1940 and \$52,918,012 for 1939. Approximate totals for output and value (each with definite totals for 1939 subjoined) were: Gold, 1,408,700 oz (1,435,264 oz), \$49,304,500 (\$50,234,240); silver, 2,235,000 oz (2,599,139 oz), \$1,589,333 (\$1,764,264); copper, 13,366,000 lb (8,360,000 lb), \$1,510,358 (\$869,440).

**Manufacturing.** Yearly production of manufactured goods in California totaled \$2,796,221,903 for 1939; \$2,899,865,426 for 1937. Other totals for 1939 (each with that for 1937 subjoined) - 12,329 (10,861) manufacturing establishments employed 275,477 (302,189) persons for wages of \$365,110,474 (\$389,132,068), paid for materials, etc., and

contract work \$1,654,318,758 (\$1,808,268,678), and added to material, by process of manufacture, \$1,141,903,145 (\$1,091,596,748).

**History.** The Legislature held a succession of sessions in 1940, mainly by reason of Governor Olson's efforts to wear down its opposition to his demands for poor-aid on what the economizers thought a too liberal scale. The first special session voted \$12,200,000 as a supplementary appropriation to meet the need for the next three months, this fell far short of what Olson wanted, and he vetoed the bill. It was promptly enacted (February 23) over his veto. One of the act's secondary provisions set a top to the State's doles, at \$58 a month for a family; another, after the manner of the Federal Hatch Act, prohibited certain abuses of political activity. The appropriation's insufficiency for the scale of spending necessitated cuts in the dispensations to the 370,000 dependents on poor-aid and reduction in the number of the State Relief Administration's force of 6500. Another enactment of this session made changes in the law on taxation of gifts and inheritances, rendering the wife's share, transferred to the husband, taxable, as well as (under previous law) the transfer of the husband's share to the wife. A second special session met on May 2 and voted about \$25,000,000 to supply poor-aid for ten months. The year's third special session convened on September 14, to add a relatively small sum for the same purpose and to give statutory authorization to a State Council of Defense, already created by the Governor, for furthering Federal defensive preparations. Another enactment excluded candidates of the Communist party from the ballot.

The Legislature's resistance to Olson's demands for more appropriations toward poor-aid reflected a widespread dread of additional taxation and a suspicion that the dispensations were serving political uses. A movement to initiate by popular petition a vote for the recall of the Governor was carried on in the earlier part of the year. A Legislative committee spent months investigating suspected abuses in the operation and personnel of the State Relief Administration. Among the results of this investigation was the discharge of 18 State relief employees for refusal to tell whether they were Communists. Relations between the Legislature and the Governor were further impaired by the discovery that a dictograph had been secretly set, in February, so as to divulge talk, at Sacramento, in the hotel rooms of Speaker Garland of the Assembly, investigation by special committee of the Assembly led to the resignation of State Motor Vehicle Director Howard R. Philbrick, who assumed responsibility for the attempted espionage. Olson denied all personal knowledge of the dictograph intrigue. M. Stanley Mosk, executive Secretary to the Governor, reportedly signed a check for \$236, out of the Governor's secret-service fund, to the order of a concern called Sound Laboratories, and this check was allegedly cashed, upon Philbrick's assurance, by the hotel, the cash being paid to a public employee, who hired the room where the receiving end of the dictograph was installed. Lieut.-Col. C. F. Henderson, a member of the Governor's staff, reportedly admitted providing a sound-machine.

Governor Olson changed the membership of the State Board of Prison Directors; acting on a disclosure that 41 prisoners at San Quentin State Prison had been flogged in March, 1939, and on his own subsequent investigation, he rid the Board

of all but one of its members and filled the vacancies with his own appointees. These soon disagreed on the penal policy and two of them demanded in September the resignation of a third.

Parts of the State remained beset by troubles with pauper migrants, disturbances in the field of organized labor, heavy costs of poor-aid, and Communist and other ultra-liberal activity. The U. S. Supreme Court held, April 22, that Shasta County's ordinance to restrain picketing in strikes—one of similar ordinances in numerous agricultural counties—clashed with the Constitutional right of free speech and was invalid; this affected labor on the Shasta Dam, where members of the A. F. L. were engaged on work sought by members of the C. I. O. A strike of ship clerks started late in 1939, ended on Jan. 3, 1940, in an agreement to negotiate a limited list of issues with employers, the strike had interrupted shipping for 54 days and caused great loss in business. The recipients of poor-aid, totaling over 100,000 "cases," conducted widespread public demonstrations in March, against the Legislature's failure to make on their behalf the full appropriations demanded by the Governor. Machinery coming into use in wide variety—for topping and harvesting sugar beets, cracking nuts, picking hops, and performing other former manual operations—threatened to cut down the need for the largely unionized farm labor in the State. The San Francisco salmon-packers announced, May 4, the abandonment of the summer's Alaskan fishing in Bristol Bay, they had failed to reach an agreement with the Alaska Fishermen's Union. The Associated Farmers continued under investigation by the LaFollette Committee of the U. S. Senate, which brought to view the organization's receipt of support from chambers of commerce, railroads, and canning interests and its devices for circumventing labor-leaders' plans (as by Mendocino County's ordinance for the licensing of labor unions). Though much investigated, the Associated Farmers remained in great measure the masters of the agricultural labor situation; they had the firm adherence of farmers who had seen their own or their neighbors' perishable crops spoil while organized workers failed to handle them.

Concurrent floods of the Sacramento and San Joaquin rivers at the end of February did damage said to approach \$10,000,000. An earthquake in the Imperial Valley, May 19, killed seven persons, injured about 100, and did damage put at \$2,000,000. See **FLOODS, RECLAMATION, BUREAU OF**.

**Decisions in the Six Labor Cases.** The State Supreme Court (October 14) overthrew in a number of points the State's labor code and divers local laws, as previously enforced or interpreted, its decision, supported by a majority of four, opposed by three members, granted contentions of labor unions that had appealed from lower courts in six cases. The opinion (by Justice Douglas L. Edmonds) indicated that the Court had to follow principles laid down by the U. S. Supreme Court in recent decisions. See also **SUPREME COURT, under Amendment XIV**.

**San Francisco.** The U. S. Supreme Court ruled against San Francisco (April 22) in a suit brought to settle the Secretary of the Interior's proceedings against the city's contract with the Pacific Gas and Electric Company for the commercial distribution of electric current from the city's Hetch Hetchy water system (See **SUPREME COURT, under Public Domain**.) A plan that sought to give the system of distribution more of the municipal

character, yet to preserve the company's services as far as possible and to avoid the need for municipal outlay in acquiring the needed distributing facilities was presented to Ickes on October 1, later on the city prepared to rent from the company its facilities for distributing electricity, under an arrangement said to satisfy Ickes.

The Golden Gate Exposition, despite receipts short of costs in 1939, reopened in May, 1940. Its second season brought substantial further attendance and returns, greatly helping to meet the total expense of the enterprise (see FAIRS) The city issued \$945,000 of bonds in June for the development of airport facilities. The affairs of a number of bridges, interurban railroads, and ferries running over the waters near San Francisco were in course of adjustment the Golden Gate ferries ceased profitless competition with the great bridge over their route and quit operation to Oakland, May 16; the Southern and the Interurban Railway companies took proceedings for the abandonment of electric lines serving surrounding communities such as Berkeley; a plan for the reorganization of the San Francisco Bay Toll Bridge Company, owning and operating the structure between San Mateo and Hayward, was condemned by the Federal Securities and Exchange Commission on the ground that proposed bonded debt greatly exceeded the property's going value and prospects The California Toll Bridge Authority purchased the Carquinez and Antioch bridges, issuing therefor \$6,444,000 of revenue bonds at low interest and designing to do away with the toll charges in seven years San Francisco's Funston Avenue approach to the Golden Gate Bridge, made at a cost of \$1,500,000 and giving access to the westerly parts of the city, was opened on April 1

San Francisco's relative freedom from strikes in 1940 was credited to the Employers' Council, a collective bargaining group

**Los Angeles.** The persistent contest of the Los Angeles Times against its conviction of contempt of court for editorial criticisms of justice dealt in some Californian courts was carried to the U S Supreme Court after the State Supreme Court had sustained the original conviction The case aroused general interest in the world of journalism, as one involving the constitutionally assured freedom of the press The questioned editorials, "Sit-Strikers Convicted," "Probation for Gorillas," and "The Fall of an ex-Queen" were charged with tending to interfere with the administration of justice

After nearly 16 years of litigation the Standard Oil Company of California paid the Federal Government \$7,138,297 and resigned control of 1232 acres valued at \$20,000,000 or more, in accordance with U S District Judge Yankwich's decision on the parties' rights in the Elk Hills petroleum field

See PORTS AND HARBORS; WATERWORKS

**Elections.** At the general election (November 5) the popular vote cast for Roosevelt (Dem.), 1,877,618, and Willkie (Rep.), 1,351,419, approximated the ratio of ten to seven; the Republican minority cast about 60 per cent more votes than in 1936. U.S. Senator Hiram Johnson was re-elected as candidate of both parties. The Democrats kept a bare majority of the State's U.S. Representatives, losing a seat that they had won in 1938 Among eight propositions adopted by the popular vote were laws doing away with pledges of property, etc., given to assure old-age assistance to persons not wholly destitute of the means of support, giving the Legislature more powers to legislate

for the government of institutions for felons; and permitting the State to own shares in mutual water companies, under particular circumstances.

**Officers.** California's chief officers, serving in 1940, were: Governor, Culbert L. Olson (Dem.), Lieutenant Governor, Ellis E. Patterson; Secretary of State, Paul Peek; Treasurer, Charles G. Johnson; Comptroller, Harry B. Riley; Attorney General, Earl Warren, Superintendent of Public Instruction, Walter F. Dexter.

**CAMBODIA.** See FRENCH INDO-CHINA.

**CAMERAS.** See PHOTOGRAPHY.

**CAMEROON, French.** A West African territory, part of the former German protectorate of Kamerun, confirmed as a mandate of France by the League of Nations in 1922 Area, 162,934 square miles; population (Jan. 1, 1938, estimate), 2,516,623. Capital, Yaoundé (20,000 inhabitants) The main products are groundnuts, maize, palm and palm-kernel oil, cacao, gold, diamonds, hides, timber, and ivory. Livestock (1939) 900,000 oxen, 25,000 asses Communications 3105 miles of roads, 314 miles of railways. Trade (1938) imports, 215,212,000 francs, exports, 251,959,000 francs Budget (1938) revenue, 139,439,747 francs; expenditure, 118,328,574 francs (franc averaged \$0.0288 for 1938) High Commissioner, Henri Brunot

**History.** With the apparent support of both the European and native population, High Commissioner Brunot aligned French Cameroon behind Gen Charles de Gaulle's "Free French" movement late in August, 1940 An order from the Vichy Government dismissing him from his post was ignored See FRANCE under History, EUROPEAN WAR under Effects of the Fall of France

**CAMEROONS, British.** A British mandated territory in western Africa Area, 34,081 square miles; population (1938), 831,103 The important products are palm kernels, palm oil, cocoa, rubber, and bananas Trade (1938) imports, £296,520, exports, £337,694 Finance (1938) £100,249 for revenue and £188,427 for expenditure During 1938 some 421 vessels aggregating 570,632 tons entered and cleared the ports of Victoria and Tiko The territory is attached to various provinces of Nigeria Administrator, the Governor of Nigeria.

**CANADA.** A Dominion of the British Commonwealth of Nations, comprising nine provinces and two territories (See separate articles on the provinces and territories.) Capital, Ottawa.

**Area and Population.** The land area, the census population of June 1, 1931, and the estimated population on June 1, 1939, are shown by provinces and territories in the accompanying table.

AREA AND POPULATION OF CANADA

Provinces and Territories	Land Area, sq miles	Population	
		1931	1939
Prince Edward Island	2,184	88,038	95,000
Nova Scotia	20,743	512,846	554,000
New Brunswick	27,473	408,219	451,000
Quebec	523,534	2,874,255	3,210,000
Ontario	363,282	3,431,683	3,752,000
Manitoba	219,721	700,139	727,000
Saskatchewan	237,975	921,785	949,000
Alberta	248,800	731,605	789,000
British Columbia	359,279	694,263	774,000
Yukon Territory	205,346	4,230	4,000
Northwest Territories	1,258,217	9,723	10,000
Total	3,466,556	10,376,786	11,315,000

The total estimated population on June 1, 1940, was 11,422,000. The Indian population in 1931 was

122,920. Of the white population in 1931, 5,381,071 were of British origin (English, 2,741,419; Scottish, 1,346,350; Irish, 1,230,808; other, 62,494) and 2,927,990 of French origin.

In 1931, 4,804,728 inhabitants resided in rural districts and 5,572,058 in urban communities. Populations of the chief cities in 1931 were: Montreal, 818,577 (1,294,792 in 1940); Toronto, 631,207 (648,309 in 1938); Vancouver, 246,593; Winnipeg, 218,785 (215,814 in 1936); Hamilton, 155,547, Quebec, 130,594; Ottawa, 126,872; Calgary, 83,761 (83,407 in 1936); Edmonton, 79,197 (85,774 in 1936); London, 71,148; Windsor, 63,108, Verdun, 60,745 (64,144 in 1939); Halifax, 59,275; Regina, 53,209 (53,354 in 1936); Saint John, 47,514; Saskatoon, 43,291 (41,734 in 1936).

Immigrants entering in Canada during 1939 numbered 16,994, of whom 5649 came from the United States, 3544 from the United Kingdom, and 7801 from other countries. Living births in 1939 numbered 229,063 (203 per 1000); deaths, 108,874 (9.6 per 1000); marriages, 103,608 (9.2 per 1000). The 1939 birth rate was highest in the province of New Brunswick (25 per 1000) and lowest in British Columbia (15.9 per 1000).

**Education and Religion.** Illiteracy rate, 1931 census, 7.2 per cent of all over five years of age. Of 2,502,510 pupils enrolled in educational institutions in 1937-38, 2,251,711 were in provincially controlled schools, 118,560 in privately controlled schools, 46,818 in courses of university standard, 20,847 in university and college preparatory courses, and 45,831 in other university courses.

The principal religious groups in Canada at the 1931 census were Roman Catholics, including 186,654 Greek Catholics, 4,285,388; United Church (Methodists, Congregationalists, and Presbyterians), 2,017,375; Anglicans, 1,635,615; Presbyterians (not included in United Church), 870,728; Baptists, 443,341; Lutherans, 394,194; Jewish, 115,614. Of the 2,927,990 Canadians of French origin in 1931, 2,849,096 were Roman Catholics.

**National Income.** The official preliminary estimate of national income for 1940 placed it at \$4,800,000,000, as contrasted with \$4,409,000,000 in 1939. The net value of production in 1938 was \$2,975,000,000 and the gross value \$5,432,000,000. Manufactures accounted for 38.78 per cent of the net value, agriculture, 24.94 per cent, mining, 12.59 per cent. The average per capita net value of production in 1938 was \$265.38. The Secretary-Treasurer of the Associated Credit Bureau of Canada stated before the organization's annual convention in 1940 that "93 per cent of the people of Canada had an income of \$2000 or less annually, 6 per cent had from \$2000 to \$5000, and only 1 per cent had more than \$5000." He estimated that about 25 per cent of the peoples' income was diverted to municipal, provincial, and Federal governments.

**Agriculture.** Cash income from the sale of farm products in 1940 was officially estimated at \$715,000,000 (\$703,000,000 in 1939). The gross value of farm production in 1939 was \$1,170,943,000 and the net value about \$815,663,000. Of the gross value, field crops accounted for \$634,130,000, dairy products, \$217,716,000; farm animals, \$170,837,000; fruits and vegetables, \$55,911,000; poultry products, \$55,483,000; tobacco, \$19,248,000. The preliminary estimate of the gross value of field crops in 1940 was \$648,286,000, compared with the revised estimate of \$669,672,000 for 1939. The acreage and production of the principal field crops in 1939 and 1940 are given in the accompanying table.

CANADIAN FIELD CROPS, 1939 AND 1940

Crops	Area		Production	
	1939 1,000 acres	1940* 1,000 acres	1939 1,000 bu	1940* 1,000 bu
Wheat	26,756	28,726	489,623	547,179
Oats	12,790	12,298	384,407	387,805
Barley	4,347	4,341	103,147	105,454
Rye	1,102	1,035	15,307	14,294
Peas	76	81	1,307	1,347
Beans	73	97	1,527	1,471
Buckwheat	335	326	6,848	6,717
Mixed grains	1,218	1,220	44,072	43,602
Flaxseed	307	406	2,169	3,406
Corn for husking	183	186	8,097	6,789

\* Preliminary

The root and fodder crops for 1940 were estimated (preliminary) as follows: Potatoes, 42,058,000 cwt.; turnips, etc., 39,153,000 cwt.; hay and clover, 14,156,000 tons, alfalfa, 2,584,000 tons; fodder corn, 4,176,000 tons, sugar beets, 847,000 tons. The livestock census of June 1, 1940, showed 5,882,000 swine, 8,565,000 cattle, 3,452,000 sheep, and 2,858,000 horses. The 1939 wool clip was estimated at 17,888,000 lb.

**Manufacturing.** Statistics for 1938: Establishments, 25,200; capital invested, \$3,485,583,018; number of employees, 642,016 (25.9 per establishment); salaries and wages, \$705,668,589, cost of materials, \$1,807,478,028; value added in manufacture, \$1,428,286,778; gross value of production, \$3,337,681,366 (\$132,051 per establishment and \$5183 per employee). Production of leading manufactures in 1939 were (estimates, in metric tons): Cement, 908,000; rayon, 6438, pig iron and ferroalloys, 845,000, steel ingots and castings, 1,407,000. The gross value of production of the paper and pulp industry in 1939 was \$208,152,000; it included 2,926,600 tons of newsprint worth \$120,858,600. Output of chemicals was valued at \$157,407,000. Production of power by central electric stations in 1939 was 28,352,000,000 kw-hr. Also see YEAR BOOK, 1939, p. 112.

**Mineral Production.** Mineral production in 1939 was valued at \$474,602,059 (\$441,823,237 in 1938). The quantity and value of the chief minerals produced was: Gold, 5,094,379 fine oz., \$105,310,157; copper, 608,825,570 lb., \$60,934,859, nickel, 226,105,865 lb., \$50,920,305; coal, 15,537,443 tons, \$48,315,224, asbestos, 364,472 tons, \$15,859,212, lead, 388,569,550 lb., \$12,313,768; zinc, 394,533,860 lb., \$12,108,244; natural gas, 35,185,146 M cu. ft., \$12,507,307; petroleum, 7,826,301 bbl., \$9,846,352, silver, 23,163,629 fine oz., \$9,378,490, platinum, 148,902 fine oz., \$5,222,589, palladium, rhodium, iridium, etc., 135,402 fine oz., \$4,199,622; salt, 424,500 tons, \$2,486,632. The output of sand and gravel was 31,294,341 tons valued at \$11,241,102; stone, 5,443,522 tons, \$6,455,696; cement, 5,731,264 bbl., \$8,511,211; lime, 552,209 tons, \$4,003,514.

**Forest Products.** Forest production in 1938 was equivalent to 2,652,698 M cu. ft. of standing timber and was valued at \$148,265,857 (logs and bolts, \$52,759,660, pulpwood, \$53,761,999, firewood, \$32,740,566). The total value of lumber production in 1938 was \$92,856,000, chiefly accounted for by 3,768,351,000 ft. of cut lumber valued at \$72,633,000.

**Fisheries.** The value of the 1939 fish catch was \$40,073,000 (\$40,493,000 in 1938). The catch of inland fisheries was valued at \$6,101,000 in 1939; of sea fisheries, \$33,972,000. Salmon accounted for \$13,409,000, lobsters, \$3,782,000; herring, \$3,780,000; cod, \$3,234,000, sardines, \$2,301,000; halibut,

\$2,118,000; whitefish, \$1,722,000, haddock, \$1,357,000.

**Fur Production.** Production of raw furs in Canada for the season ending in June, 1939, was valued at \$14,207,000. About three-fifths of this total represented pelts of wild animals taken by trapping, while the remainder came from animals on fur farms. Pelts taken included 319,673 silver fox valued at \$5,660,000; 219,186 mink, \$2,092,600; 2,260,400 muskrat, \$1,983,700, 63,688 beaver, \$980,000. The number of animals on fur farms in 1938 was 270,431, valued at \$8,930,000.

**Tourist Trade.** According to Canadian official estimates, United States tourists spent 262,000,000 Canadian dollars in Canada during 1939 against expenditures of \$95,000,000 by Canadian tourists in the United States. Travelers from overseas spent about \$13,000,000 in Canada against expenditures of about \$15,000,000 by Canadians traveling overseas.

**Foreign Trade.** Canada's total foreign trade increased from \$1,526,135,487 in the calendar year 1938 to \$1,686,977,247 in 1939. Imports for consumption in 1939 were \$751,055,534; exports of Canadian produce, \$924,926,104; exports of foreign produce, \$10,995,609. The chief export classes in 1939 were Wood, wood products and paper, \$242,541,043, agricultural and vegetable products, \$220,118,056, non-ferrous metals and their produce, \$182,890,103, animals and animal products, \$131,803,706. Leading imports were: Iron and its products, \$183,159,650; non-metallic minerals and their products, \$132,823,892, agricultural and vegetable products, \$127,835,146, fibers, textiles, and tissues, \$100,866,078.

The chief sources of Canadian imports for consumption in 1939 were: United States, \$496,898,466; United Kingdom, \$114,007,409, Straits Settlement, \$13,144,970; Australia, \$11,269,594, Germany, \$8,947,155. Exports went mainly to United States, \$380,392,047; United Kingdom, \$328,099,242, Australia, \$32,028,744, Japan, \$28,167,607; British South Africa, \$17,965,280.

**Finance.** The accompanying table shows the total Dominion budget receipts, ordinary expenditures, and total expenditures for the period 1936-37 to 1940-41.

DOMINION FINANCES  
(Thousands of Canadian dollars)

Years ended March 31	Total revenues	Ordinary expendi- tures	Total expendi- tures	Surplus (+) or deficit (-)
1936-37	\$454,154	\$387,112	\$532,005	-\$ 77,851
1937-38	516,693	414,891	534,408	- 17,715
1938-39	502,171	413,032	553,063	- 50,892
1939-40	562,093	398,323	680,794	- 118,700
1940-41*	760,000	448,000	1,148,000 <sup>b</sup>	- 388,000 <sup>b</sup>

\* Estimates    <sup>b</sup> Excluding additional war commitments estimated at \$150,000,000 to \$200,000,000.

The Dominion funded debt and Treasury bills outstanding on Mar. 31, 1940, totaled \$3,695,685,192 (\$3,385,697,034 on Mar. 31, 1939). The annual average exchange rate of the Canadian dollar was \$0.9942 in 1938, \$0.9602 in 1939, \$0.8514 in 1940.

**Shipping.** During the calendar year 1939 a total of 40,894 vessels of 33,997,984 net registered tons entered the eight leading seaports (40,467 ships of 34,030,575 tons in 1938). The leading ports, in order of tonnage entered in 1939, were: Vancouver, 11,993,815; Montreal, 7,588,940; Halifax, 6,054,412; Quebec, 4,219,192; Saint John, 2,500,598; Three Rivers, 1,549,829. Inward cargo tonnage at the eight ports was 18,007,242 in 1939;

outward, 11,686,915. Traffic through Canadian canals in 1939 included 24,768 Canadian vessels of 18,240,632 registered tons and 2757 United States and other vessels of 3,095,648 registered tons.

**Railways, etc.** As of Dec 31, 1938, Canada had 42,742 single track miles of steam railways, owned by 34 companies, exclusive of 1957 miles of street and interurban electric railways and 1016 miles of industrial railways. Gross revenues of the 34 steam railways in 1939 were \$363,325,824; operating expenses, \$301,986,407. The profit and loss account, after payment of interest, taxes, etc., showed a debit of \$55,023,359 in 1938, compared with an average debit during the five years 1933-37 of \$73,312,927. Passengers carried during 1939 numbered 19,097,316, revenue freight, 91,042,896 tons.

The total highway mileage in 1939 was 599,040 and the number of automobiles registered 1,375,133. Aviation statistics for 1939 were: Miles flown, 10,969,271, passengers carried, 161,503, freight carried, including excess baggage, 21,253,364 lb, mail carried, 1,900,347 lb. The new Trans-Canada air system in 1939 carried 21,569 passengers, 500,000 lb of mail and 45,819 lb of express.

**Government.** Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry. Legislative power rests in a parliament of two houses—a Senate of 96 members appointed for life by the Governor-General on advice of the Cabinet and a House of Commons of 245 members elected for five years (unless the government is sooner dissolved) by popular male and female suffrage. The nine provinces enjoy a large measure of local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive. Baron Tweedsmuir of Elsfeld (John Buchan), who assumed office as Governor-General Nov 2, 1935, died Feb. 11, 1940 (see NECROLOGY). On April 4 the Earl of Athlone, uncle of King George VI, was appointed to the post; he was installed June 21, 1940.

The composition of the Liberal Government, sworn in Oct 23, 1935, and reconstructed in September, 1939, was as follows at the beginning of 1940, in order of precedence: Prime Minister, President of the Privy Council, Secretary of State for External Affairs, W. L. Mackenzie King; Minister without Portfolio, Raoul Dandurand; Mines and Resources, Thomas Alexander Crerar; Justice, Attorney-General, and Acting Secretary of State, Ernest Lapointe; Public Works, Pierre Joseph Arthur Cardin, Trade and Commerce, William Daum Euler; Finance, James L. Ralston, Pensions and National Health, Ian Alastair MacKenzie, Postmaster-General, Charles Gavan Power; National Revenue, James Lorimer; Fisheries, Joseph Enoil Michaud; National Defense, Norman McLeod Rogers; Transport, Clarence Decatur Howe; Agriculture, James Garfield Gardiner; Labor, Norman A. McLarty; Minister without Portfolio, James A. MacKinnon. For changes during 1940, see *History*.

## HISTORY

The war in Europe dominated every aspect of Canada's internal and external affairs during 1940, particularly after the collapse of France in June enhanced the prospect of a German victory. The general election of March 26, the intensification of Canada's war effort, the rapid expansion of industrial production and employment, and the

unprecedented steps taken toward politico-military collaboration with the United States were all determined or strongly influenced by the spreading European conflagration.

**Liberals Re-elected.** The opening of 1940 found Prime Minister Mackenzie King's Liberal Government under vigorous attack from the Conservative opposition for alleged inefficient and partisan conduct of the war (see 1939 YEAR BOOK, p. 116). Early in January Mitchell Hepburn, Liberal Premier of Ontario, joined in these attacks, thus reviving his old quarrel with Mackenzie King. On January 18 he induced the Ontario Legislature to adopt a resolution condemning the Federal Government for the "weakness" of its war effort.

On January 25 the Canadian Parliament convened for its first regular session since the outbreak of war. With a general election due to be held sometime during 1940, the Conservatives and dissident Liberals came prepared to press their charges against the government. With his customary political acumen, the Prime Minister forestalled this plan by dissolving Parliament on the first day of the new session and calling the general election for March 26. In a short but bitter campaign, the Conservatives, led by Dr. R. J. Manion, redoubled their charges of inefficiency and partisanship in the prosecution of the war. They said the government had sent the 1st Division of the Active Service Force overseas with insufficient clothing and out-moded arms, that it had withheld full co-operation from the British Government in war preparations, and it was wasting war appropriations through maladministration and political patronage. Dr. Manion promised that if elected he would form a "national government" containing the best brains of the country to carry on the war.

The Mackenzie King Government stood on its war record, denied the Conservative charges, rejected the demand for a "national government" as inadvisable and dangerous, and contended that it alone could maintain the unity between French- and English-speaking Canada essential to the successful prosecution of the war. Of the 4,458,861 votes cast on March 26 the Liberals received 53 per cent and increased their standing in the House of Commons from 176 seats at the time of dissolution to 183. The Conservatives captured 40 seats, or 1 more than before. The Co-operative Commonwealth Federation (Socialists) increased their standing from 7 to 8, while the other minority groups lost ground, as follows: Social Credit-New Democracy coalition, reduced from 16 to 9 seats; Independents, reduced from 7 to 5. Isolationist and pacifist candidates were overwhelmed. Dr. Manion and many other veteran leaders of the Conservative party were defeated. As a result of this electoral debacle, Dr. Manion's resignation as leader of the party was accepted on May 13. He was succeeded as parliamentary leader for the next session by R. B. Hanson, who was Minister of Trade and Commerce in the last Conservative Government.

**Governmental Changes.** Prime Minister Mackenzie King, asserting that the election vindicated the personnel and policies of his government, continued to reject all demands for a coalition or "national government." There were several changes in his cabinet, however. A separate Air Ministry was established late in May. On June 10 Defense Minister Rogers was killed in an airplane ac-

cident. On June 18 a new Ministry of National War Services was established to co-ordinate the care of refugees, the provision of comforts for soldiers, economic use of food supplies, etc. Then the National Defense Ministry was split into three separate Ministries in charge of Military Affairs, Naval Affairs, and Military Aviation, respectively. Three more Liberals were brought into the Cabinet and there was a reshuffling of some other posts. Heads of the new and reorganized Ministries, announced for the most part on July 8, were: National Defense (Army), Col. J. L. Ralston (former Finance Minister); National Defense (Navy), Premier Angus L. Macdonald of Nova Scotia; National Defense (Air), C. G. Power; Finance, J. L. Ilsley, National Revenue, Col. C. W. Gibson, Transport and Public Works, P. J. A. Cardin; War Services and Agriculture, J. G. Gardiner; Postmaster-General, W. P. Mullock.

At the same time the Prime Minister invited the Conservative party leaders, R. B. Hanson and Grote Stirling, and leaders of the smaller Opposition groups to become associate members of the War Committee of the cabinet. They replied that they would not accept office and surrender the right of criticism unless they were offered membership and full responsibility in a genuine coalition government.

**War Parliament Meets.** When the newly elected Parliament assembled on May 16 the German invasion of Norway, Denmark, the Netherlands, and Luxemburg had been crowned with success. Belgium and France were crushed, the British Army defeated in Flanders and Northern France, and Italy brought into the war during the ensuing weeks. These events shocked the Canadian Government and people into action. The government had planned a war of "limited liability" in which Canadian materials and air power would be its principal contribution. The great Empire air training program, centering in Canada, was designed to turn out pilots in quantity only in the second or third year of the war. Industrial mobilization had been geared to a similar time schedule.

When Hitler's *blitzkrieg* demonstrated these plans to be woefully inadequate, the Opposition intensified its attack upon the government's prosecution of the war. But when Parliament adjourned on August 7 Prime Minister Mackenzie King was politically stronger than at the outset of the session. This was due to the fact that the Chamberlain Government in London was shown to be mainly responsible for Canada's half-way measures up to the outbreak of "total war" in Europe. It discouraged the raising of a large army, and failed to give Canadian industry sufficient military orders either before or after the outbreak of war to secure capacity production. Moreover there was no other leader available with the experience and prestige to fill Mackenzie King's shoes. The Prime Minister also allayed criticism by speeding the mobilization of Canada's full resources to support the hard-pressed mother country, reorganizing his cabinet as described above, and taking firm measures against "fifth column" and other obstructionist elements.

Parliament reconvened on November 7. On December 3 the House defeated, 140 to 51, an Opposition move to censure the government for "soothing" the Canadian people into a false sense of security and failing to alleviate the condition of the farmers.

**Conscription Introduced.** Immediately after the collapse of France, Parliament on June 20 empowered the government to mobilize the entire manpower and material resources of the Dominion for war purposes. The bill was adopted with only two French-Canadian members of the House dissenting. The Prime Minister had previously renewed his pledge never to conscript Canadians for overseas service.

Under this act and a measure of July 10 establishing the Department of War Services, all Canadian men and women over 16 years of age were registered for possible war service during August 19-21. On October 9 compulsory military training in the Non-Permanent Active Militia was begun when 30,000 men, of 21 to 23 years of age, were called up for 30 days. It was planned to give 300,000 unmarried men the 30-day course during the ensuing year and later to call up married men. The government gave assurances that this conscription related "solely and exclusively to the defense of Canada on our own soil and in our own territorial waters." The Canadian air force, navy, and divisions raised for overseas service were composed entirely of volunteers.

Fears that French-Canadian opinion would oppose conscription were allayed by the hearty support accorded the measure by most French-Canadian leaders and by the Roman Catholic Church in Quebec Province. The notable exception to this rule was Mayor Camillien Houde, mayor of Montreal, who on August 2 asked the people of his city to support him in defying the national registration law. On August 6 he was interned for the duration of the war on orders of Minister of Justice Lapointe. This action appeared to have the approval of most French-Canadians. The French-Canadian press likewise approved the British attack upon the French fleet at Oran (see *EUROPEAN WAR*) as lessening the danger of a German attack upon Canada. Houde sought to run for re-election but this plan was balked by an Order in Council of October 29 making interned persons ineligible for public office. See *QUEBEC* under *History*.

**Aid to Britain Speeded.** In addition to training men for home defense, the government late in May greatly accelerated its program for supplying military and economic aid to Britain. Recruiting for overseas service was speeded up. By October 1 the Active Service Force numbered more than 167,000 men, of whom 53,000 were serving overseas—two divisions and additional corps troops in England and detachments in Iceland, Newfoundland, and the West Indies. The Royal Canadian Air Force, which numbered 450 officers and 4000 airmen in September, 1939, increased to 1950 officers and 23,000 airmen by Oct. 1, 1940. A few squadrons were already in action in England. The Canadian Navy had about 130 vessels and more than 11,000 officers and men, as against 13 ships and 1700 officers and men at the beginning of the war. It was engaged in protecting the Canadian coasts and providing invaluable aid to the British navy in guarding transatlantic convoys. In all, about 500,000 men were under arms by December 31.

**Economic Mobilization.** All of these services were undergoing rapid expansion as the year ended. By the beginning of 1942 it was expected that the air training schools would be turning out 7500 to 8000 pilots and 14,000 to 16,500 air

observers and air gunners annually. To equip and maintain these increasing forces and to aid British rearmament, Canadian factories in October, 1940, were producing about 130 planes, minus engines, monthly; rifles, small arms, machine guns, and munitions; and a small but increasing supply of tanks, field artillery, antitank and antiaircraft guns. Under construction for the navy were 54 patrol vessels, some 30 minesweepers, and 25 motor torpedo boats. Contracts for Canadian war orders totaling \$345,000,000 and British war orders aggregating \$100,000,000 had been distributed among 4400 Canadian firms. War plant expansions totaling approximately \$225,000,000 were under way.

It was estimated that by the end of 1941 Canadian industry would be producing arms and war supplies of almost every kind at the rate of over \$1,000,000,000 annually. The co-ordination of this effort was in charge of the Department of Munitions and Supplies. In August, 1940, it decentralized its activities, establishing three government-owned, non-profit corporations, headed by leading businessmen, to administer the armament industries. A Wartime Industries Control Board was set up, with extensive powers to control the steel, metals, timber, machine tool, electric power, and oil industries. On May 23 key munitions industries were placed on a 24-hour basis.

**War Financing.** To finance this program, the Dominion budget for the fiscal year 1940-41 carried war appropriations of \$940,118,000. Direct and indirect war expenditures of the Dominion, provincial, and municipal governments were estimated at nearly \$1,975,000,000. Taxes were drastically increased. The income tax was raised 300 per cent in some brackets. On an income of \$3000 a year a married man with no dependents paid \$195; on \$5000, he paid \$555; on \$10,000, he paid \$2170. In addition a 10 per cent tax was paid on all goods purchased in the United States and other non-Empire sources, the aim being to conserve Canada's dollar exchange. On industrial profits, the tax was raised to 18 per cent of all profits plus 75 per cent of whatever profits remained in excess of the average profits made during the preceding four years. A 2 per cent tax was levied on salaries. But despite the new taxes the government anticipated a deficit of nearly \$600,000,000 in 1940-41. This was to be covered by borrowing. A bill for the refunding of \$750,000,000 in maturing obligations was passed May 31. Besides interest-bearing loans, the government in July offered \$10,000,000 worth of non-interest-bearing bonds. A substantial part of these were quickly disposed of. In addition more than \$500,000 was donated to the government for war expenses.

The government's financial policy sought to prevent price inflation and an excessive increase in the public debt. Steps to control prices were taken beginning in August. To prevent depreciation of the Canadian dollar on foreign exchange markets, the Foreign Exchange Control Board on May 1 took over at the current market price the entire holdings of gold and foreign exchange of the Bank of Canada. All residents of Canada holding foreign currency were required to sell it to the Exchange Control Board. On December 6 Parliament imposed a 25 per cent excise tax on "luxury" manufactures, partly in order to enable industry to concentrate on war necessities.

**Labor Measures.** As a result of heavy war expenditures, the number of unemployed in Canada

declined steadily during 1940 to the lowest point since 1929. By autumn, shortages of skilled labor were reported in many industries. This trend was accompanied during April, May, and June by an increase in labor disputes, which threatened to hold up production.

The government adopted a liberal policy in an effort to secure better co-operation from labor. In an Order-in-Council of June 20 it reaffirmed labor's right to unionize and bargain collectively. It requested employers to adopt "fair and reasonable standards of wages and working conditions" and warned against undue extension of hours of labor. At the same time it insisted that there should be no interruption of production or distribution through strikes or lockouts, declaring that all employer-labor controversies should be settled through government conciliation agencies. No machinery for enforcement of these principles was provided, nor were penalties mentioned in the Order-in-Council. However the National Mobilization Act provided ample authority for any disciplinary action the government considered necessary.

The government took another step calculated to win labor's approval of its war efforts by securing the enactment by Parliament on July 30 of Canada's first national unemployment insurance law. The program covered 2,100,000 workers earning less than \$2000 annually, but persons within that income range employed in certain professions, domestic service and seasonal occupations were excluded. Employers and employees contributed approximately equal amounts to the insurance fund, while the government paid one-fifth of the total and assumed the administrative costs.

Labor was given equal representation with employers upon the National Labor Supply Council appointed June 20, 1940. In addition, maximum-hour and minimum-wage provisions were embodied in contracts for the manufacture of aircraft and other war equipment awarded by the War Supply Board. The Minister of Labor announced on November 28, however, that because of air-raid damage to British industry and shipping, it would be necessary to extend the working week from 44 to 48 hours. An Order in Council of December 18 established a conciliation commission to adjust wages to rising living costs.

**Aid to Agriculture.** The spread of the war increased the difficulty of finding markets for Canadian wheat, fruit, bacon, and dairy products. Larger purchases of farm products by Great Britain failed to make up for the normal purchases of the European continent, cut off by the British blockade. The wheat problem became acute when the 1940 crop proved to be the second largest on record. Despite the sale of 100,000,000 bu of stored wheat to the British Government on August 2, the carry-over from the 1939 crop was also exceptionally large. The Canadian Government on May 18 pegged the price on wheat futures at 70 cents; the cash price was fixed at a slightly higher level. To maintain this price and to compensate growers for storing surplus wheat, Parliament on August 3 enacted a processing tax of 15 cents a bushel on wheat processed into flour and other products for domestic consumption. Government aid in financing and marketing their crops was also extended to fruit growers and dairy farmers.

**Drive on "Fifth Column."** With the intensification of Canada's war effort, beginning in April

and May, the government took more stringent measures to curb subversive and pacifist activities. Under the Defense of Canada Regulations adopted Sept 9, 1939, three men were sentenced to prison terms and fines by an Ottawa court on May 15 for circulating Communist literature of a seditious nature. The court declared the Communist party of Canada an illegal organization and many leaders of the party were subsequently taken into custody. Canadian officials charged that the Communist party and press were spreading Nazi propaganda, and in some cases receiving German financial aid.

On May 30 Adrian Arcand, leader of the National Unity (Fascist) party, and a number of his associates were arrested in Montreal on charges of plotting against the state. Minister of Justice Lapointe on June 21 announced the banning of the National Unity party and the internment of Arcand and 10 other leaders, mostly French-Canadians, for the duration of the war. Correspondence was made public indicating that Arcand was in contact with German and Italian propaganda agencies.

Minister Lapointe on June 5 introduced an Order in Council in Parliament declaring illegal a dozen organizations described as fronts for Communist, Nazi, and Fascist activities. Among them were the Communist party of Canada, Labor Defense League, League for Peace and Democracy, German Labor Front, the Canadian branch of the German Nazi party, etc. With Italy's entrance into the war, several hundred Italian citizens were rounded up for questioning and all others were registered and fingerprinted. Most of the Italian organizations adopted resolutions of loyalty to Canada and denounced Mussolini's entrance into the conflict. Of some 16,000 German and 15,000 Italian aliens in Canada, only about 300 Germans and a smaller number of Italians were interned. The others were required to report to the authorities weekly or monthly. On August 23 the government cancelled naturalizations of all men and women immigrants from Germany and Italy who took out papers after Sept 1, 1922, and they were required to report as enemy aliens unless they were able to obtain certificates establishing their status as loyal subjects.

Repeated attempts at sabotage of war industries and evidence of widespread German espionage activities led Parliament on July 25 to adopt the so-called Treachery Bill making anyone assisting the armed forces of the enemy or imperiling the safety of Canada liable to the death penalty or life imprisonment. At the same time the government decided to organize Provincial Civil Guard units to aid the militia and other armed forces in maintaining order and curbing sabotage. In addition to the camps established for interned residents of Canada, the government undertook in June to assume charge of 6700 war prisoners and internees sent from the United Kingdom. The first of these prisoners arrived on July 1. Canada also provided a refuge for some thousands of British children and for a number of prominent refugees, including Crown Princess Juliana of the Netherlands and her daughters.

**Constitutional Problems.** In the midst of the war, the constitutional issues that had aroused controversy during previous years (see 1939 YEAR BOOK, p. 116) were for the most part postponed. On May 16 the House of Commons tabled the report of the Commission on Dominion-Provincial

Relations, appointed in 1937. The Commission's recommendation concerning unemployment insurance were put into effect (see above), but no other action was taken on its proposals. It recommended that the Dominion assume 40 per cent of the Quebec provincial debt and the entire debts of the other provinces; that all future provincial borrowings be handled through a central commission, under Dominion guarantee; that the Dominion assume complete responsibility for relief of unemployed employables, leaving the provinces and municipalities to administer poor relief and care for unemployables; that the Dominion receive sole power to collect income, inheritance, and corporation taxes, and that it should assist the provinces through national adjustment financial grants, renewable every five years, instead of through the existing subsidies.

Another important constitutional development was the decision of the Supreme Court of Canada on January 19 that Parliament had authority to abolish appeals to the Privy Council in London from the Canadian courts. On June 25 the Canadian House of Commons formally requested amendment of the British North America Act to legalize the Dominion unemployment insurance scheme, mentioned above under *Labor Measures*. In invalidating a similar law adopted in 1935, the courts held that the provinces had jurisdiction in this field.

**Empire Relations.** The spread of the European War, the entrance of Italy, Japan's alliance with the Axis powers, and the growing possibility of an Axis victory drew Canada into ever closer relations with both the mother country and the United States. The German occupation of Denmark and defeat of France brought the war near Canadian shores as it opened the possibility of German control over Greenland and the French islands of St Pierre and Miquelon. Canada assumed responsibility for the defense of Newfoundland and Labrador, contributed contingents to the British expedition that occupied Iceland, and sent other forces to relieve British and French troops garrisoning strategic territories in the West Indies. During the German drive into France, Prime Minister Mackenzie King informed the House of Commons June 4 that the Dominion had placed her naval, military, and air forces at the complete disposal of the British Government. On June 10 Canada's declaration of war upon Italy was unanimously approved by Parliament. The Prime Minister on June 14 pledged Canada's "unwavering support" to Great Britain and France, and when France capitulated the pledge of solidarity with Britain was reaffirmed by the government and people.

When Japan joined the Axis, the Canadian Government moved more troops to the Pacific Coast, strengthened its fortifications there, and dispatched contingents to aid the British in the defense of Empire positions in the Pacific and the Far East. On October 8 the export of copper to Japan was embargoed. The shipment of other strategic war metals to Japan previously had been banned.

**Defense Pact with United States.** On August 18, Prime Minister Mackenzie King met President Roosevelt at Heuvelton, near Ogdensburg, N.Y., for a conference of historic significance. They agreed to establish a Permanent Joint Board on Defense to "consider in the broad sense the defense of the north half of the Western

Hemisphere" and "commence immediate studies relating to sea, land, and air problems including personnel and material."

Members of the Board were appointed August 22. Those representing the United States were Mayor Fiorello H. La Guardia of New York City, Lt. Gen. Stanley D. Embick, commanding the Fourth Corps Area, Atlanta, Ga.; Capt. Harry W. Hill, U.S.N., War Plans Division, Office of Chief of Naval Operations; Comdr. Forrest P. Sherman, U.S.N., Lt. Col. Joseph T. McNarney, U.S. Army Air Corps; John D. Hickerson, Assistant Chief, Division of European Affairs, Department of State. The Canadian members were: O. M. Biggar, Brigadier K. Stuart, Deputy Chief, General Staff; Capt. L. W. Murray, R.C.N., Deputy Chief, Naval Staff, Air Comdr. A. A. L. Cuffe, Air Staff, Royal Canadian Air Force, Hugh L. Keenleyside, Counselor, Department of External Affairs.

The Board assembled in Ottawa August 26 to commence its task. Meetings in various American and Canadian cities and inspections of Pacific and Atlantic Coast defenses of Canada, the United States, and of Bermuda followed. On October 4, after consulting representatives of Newfoundland, the Board issued its first definitive report at Halifax, N.S., fixing defense responsibilities of both Canada and the United States in case of an attempted invasion of either country.

While these studies were in progress, the British Government on September 2 authorized the United States to lease naval and air bases in Newfoundland, Bermuda, and the British West Indies (see *GREAT BRITAIN under History, UNITED STATES*). The Canadian-American and Anglo-American agreements established a new relationship between the three countries, the far-reaching implications of which were recognized and welcomed by Canadian opinion. They were followed by supplementary moves. The Washington Government on September 5 agreed to supply 80,000 rifles, many obsolete tanks, and other large stocks from its World War reserves for use in training and equipping Canadian armed forces. An agreement facilitating air transportation between the two countries was concluded September 24. Canada obtained a favored position in purchasing vital machine tools in the United States.

On October 14 Washington authorized the Ontario hydroelectric system to take more water from the Niagara River for its power needs at Niagara Falls. In return the province was reported to have withdrawn its opposition to the Canadian-American St. Lawrence waterpower and ship canal project (see 1939 YEAR BOOK, p. 117). Engineering studies for the installation of the projected power stations were started toward the end of 1940. On October 19-20, the Earl of Athlone paid a two-day visit to President Roosevelt at the latter's Hyde Park, N.Y., home. President Roosevelt announced December 5 that he would seek the earliest possible Senate approval of a treaty for completion of the St. Lawrence seaway.

Commencing July 1 Canadians visiting the United States were required to have passports or visas, due to the "critical international situation." Thousands of visas were issued by the United States consular offices in the Dominion. No restrictions were placed on United States citizens entering Canada. The U.S. Attorney General, Robert H. Jackson, attended a conference in Ottawa November 11-12, where proposals were

adopted for simplifying formalities for crossing the border and preventing subversive elements from taking refuge alternately in Canada and the United States. On December 6 Canada banned imports of a long list of "luxury" goods from the United States in order to conserve dollar exchange for the purchase of American munitions and other war supplies.

See **INDUSTRIAL CHEMISTRY**, **LABOR CONDITIONS**; **MUSIC**; **NAVAL PROGRESS**, **NEWFOUNDLAND under History**, **UNITED STATES under Foreign Affairs**.

**CANADA, The United Church of.** The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada, the Methodist churches of Newfoundland and Bermuda are also included. Foreign mission work is carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa). In 1939 there were in Canada, Newfoundland, and Bermuda 7389 preaching places (including home missions) in 2815 pastoral charges, 711,712 communicant members, and 1,768,098 persons under pastoral care. A total amount of \$11,673,098 was raised for all purposes. At the Ninth General Council held in Toronto, Ont., in September, 1940, the Rev Aubrey S. Tuttle, M.A., D.D., was chosen moderator for the ensuing biennium. Rev Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters: 421 Wesley Building, Toronto, Ont.

**CANALS.** See **AQUEDUCTS**, **NICARAGUA under History**, **PANAMA CANAL ZONE**, **PANAMA CANAL**, **RECLAMATION**, **BURLAU OF**, **SUEZ CANAL**, **WATERWAYS**, **INLAND**.

**CANARY ISLANDS.** An archipelago off the coast of Rio de Oro in northwest Africa. Administratively they form two provinces of Spain, and are named after their respective capitals: (1) Las Palmas (comprising the islands of Gran Canaria, Lanzarote, Fuerteventura, and the islets of Alegranza, Roque del Este, Roque del Oeste, Graciosa, Montaña Clara, and Lobos), area, 1279 square miles; population (1939), 286,154, capital, Las Palmas (83,553 inhabitants) on Gran Canaria. (2) Santa Cruz de Tenerife (comprising the islands of Tenerife, Palma, Gomera, and Hierro), area, 1528 square miles; population (1939), 350,647; capital, Santa Cruz de Tenerife (66,429 inhabitants). A decree expropriating land at Las Palmas for immediate construction of a large military base was issued by General Franco, dictator of Spain, on Dec. 29, 1940. See **SPAIN under History**.

**CANCER.** See **BIOLOGICAL CHEMISTRY**, **MEDICINE AND SURGERY**, **PUBLIC HEALTH SERVICE**, **SOCIETIES under Control of Cancer**.

**CANNING INDUSTRY.** See **AGRICULTURAL MARKETING SERVICE**, **WAGE AND HOUR DIVISION**.

**CANTON ISLAND.** An atoll of the Phoenix group in the central Pacific which with Enderbury Island of the same group is under the joint control of Great Britain and the United States (Anglo-U.S.A. Pact of Aug. 10, 1938 and Notes of Apr. 6, 1939). Canton is 29 miles in circumference and has a land mass of from 50 to 600 yards wide which encloses a lagoon of 9 miles in diameter. Enderbury is 2.5 miles long and 1 mile wide. On Mar. 15, 1940, six U.S. Navy patrol bombers landed safely at Canton after a mass flight of nearly 2000 miles from Honolulu. Canton is a port of call on Pan American Airways' transpacific air service from Los Angeles to Auckland, New Zealand, which commenced on

July 12, 1940. A complete air base, a 24-room hotel, and other facilities for passengers have been established. In March, 1938, several Hawaiian colonists were established on Canton and Enderbury islands by the U.S. Department of the Interior to maintain American sovereignty. In October, 1940, this responsibility was transferred to the Pan American Airways staff and the colonists were withdrawn.

**CAPE OF GOOD HOPE.** See **SOUTH AFRICA**, **UNION OF under Area and Population**.

**CAPE VERDE ISLANDS.** A dependency of Portugal, 320 miles west of Cape Verde, French West Africa. The islands comprise the Barlavento (windward) group (São Vicente, Santo Antão, São Nicolau, Santa Luzia, Sal, Boavista, Branco, and Raso) and the Sotavento (leeward) group (Santiago, Maio, Fogo, Brava, Rei, and Rombo). Total area, 1557 square miles; population (Jan. 1, 1938, est.), 165,000 including 6318 Europeans. Capital, Praia (on Santiago), 6188 inhabitants. The chief products are sisal, castor oil, mustard, coffee, oranges, maize, tobacco, salt, brandy, and hides. Trade (1938) imports, 107,089,584 escudos, exports, 117,754,489 escudos. Budget (1939) 19,452,000 escudos (escudo averaged \$0.0404 for 1939, \$0.443 for 1938). During 1938 some 4488 ships aggregating 4,246,395 tons cleared the ports. Governor, Maj. A. G. de Figueiredo.

**CARNEGIE ENDOWMENTS.** **Carnegie Corporation of New York.** Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable in the British Dominions and Colonies. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1939-40 the sum of \$4,692,682 was appropriated. See **BENEFACTIONS**; **EDUCATION**, **LIBRARY PROGRESS under Gifts, Grants, and Buildings**.

The trustees of the corporation as of Dec. 1, 1940, were Thomas S. Arhuthnot, W. Randolph Burgess, Vannevar Bush, Nicholas Murray Butler, Samuel Harden Church, Henry James, Walter A. Jessup, Nicholas Kelley, Frederick P. Keppel, Russell Leffingwell, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr. Officers of administration were: Frederick P. Keppel, president, Robert M. Lester, secretary; and Robertson D. Ward, treasurer. Office: 522 Fifth Avenue, New York City. See **ART MUSEUMS**.

**Carnegie Endowment for International Peace.** Founded by Andrew Carnegie in 1910 and operated as an unincorporated association until 1929 when it was chartered under the laws of the State of New York. The endowment consists of a trust fund of \$10,000,000, "the revenue of which," in the words of the donor to his original Trustees, "is to be administered by you to hasten the abolition of international war, the foulest blot upon

our civilization." The work of the Endowment is carried on in three Divisions: (1) Division of Intercourse and Education; (2) Division of International Law; (3) Division of Economics and History.

Under the first Division, contacts with the public at large are maintained principally through the promotion of international visits of representative groups and individuals, international exchanges of professors and students, the organization of and assistance to International Relations Clubs in colleges and universities in the United States and foreign countries, and the dissemination of information in books, pamphlets, and other literature dealing with the history, culture, and institutions of foreign countries.

The work of the second and third Divisions concerns mainly research and publication.

The Division of International Law has published several series dealing with the development of international law and arbitration, the proceedings of diplomatic conferences, the application of international law in national and international courts, and specialized legal problems in the international field. Representatives of this Division participated effectively in the formulation of the statute of the Permanent Court of International Justice at The Hague. It has awarded a number of fellowships, and from 1923 to 1940 it supported the Academy of International Law at The Hague during the summer months where courses were given by an international faculty and attended each year by between three and four hundred students from all parts of the world. By these and various other means, it has consistently sought to improve the teaching, and promote a better understanding, of international law.

The Division of Economics and History prepared and published the Economic and Social History of the World War, now completed in some two hundred volumes. It was assisted in this work by editorial boards in all the countries seriously affected by the World War. It has under preparation and in course of publication special series dealing with the Paris Peace Conference, Canadian-American relations, international economic relations of the United States, and commercial and tariff histories of the principal European countries.

A special library containing 65,000 volumes on all aspects of public international relations is maintained in Washington. During the fiscal year ended June 30, 1940, the Endowment's income amounted to \$605,087, which included a grant of \$100,000 from the Carnegie Corporation of New York. During this period, the Endowment expended \$537,871. The officers are: President, Nicholas Murray Butler; Vice-President, John W. Davis; Secretary, George A. Finch; Treasurer, Alanson B. Houghton; Assistant Treasurer, Roland S. Morris. Administrative offices are at 700 Jackson Place, Washington, D.C.

**Carnegie Foundation for the Advancement of Teaching, The.** A foundation established in 1905 by Andrew Carnegie, who placed an endowment of \$10,000,000 in trust for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. Following its incorporation by Congress in 1906, its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908 and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York. On June 30,

1940, its endowments and accumulated reserves amounted to \$24,504,468.

The foundation publishes extensive annual reports, which deal with many phases of the educational process. In 1940 it was engaged upon various studies concerning higher education in the United States, the relations between secondary and higher education in Pennsylvania, and graduate instruction. Dr. Walter A. Jessup is president, and Howard J. Savage, secretary and treasurer. Headquarters are at 522 Fifth Avenue, New York City.

**Carnegie Hero Fund.** A Fund established in 1904 by Andrew Carnegie to help those who have risked their lives to an extraordinary degree to save human life or to aid dependents of rescuers who have lost their lives in the performance of their acts. The original endowment was \$5,000,000, the amount expended to Oct. 31, 1940, was \$6,000,500. Dr. Thomas S. Arbuthnot is President and Mr. C. B. Ebersol is Assistant Secretary and Manager of the Fund, the address of which is 2307 Oliver Building, Pittsburgh, Pa.

**Carnegie Institute,** located in Schenley Park, Pittsburgh, Pa., founded and endowed by Andrew Carnegie in 1896, comprises a group of cultural and educational departments as follows: The Department of Fine Arts, with a representative and growing collection of modern painting and sculpture, and with the distinction of having the only annual international exhibition of paintings in the world; the Carnegie Museum, covering the natural sciences and applied arts; and the Carnegie Music Hall, where from October to July free organ recitals are given on Saturday evenings and Sunday afternoons. The Music Hall is also used by many distinguished musical artists and lecturers. The Carnegie Institute building, a modification of the Italian Renaissance style, covers about four acres, and stands among the world's great works of architecture. Thirty-six prominent citizens of Pittsburgh constitute the Board of Trustees. The officers of the Board are as follows: Samuel Harden Church, President; William Frew, Vice-President; Augustus K. Oliver, Secretary; Richard K. Mellon, Treasurer.

**Carnegie Institution of Washington.** An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." The Institution attempts to advance fundamental research in fields not normally covered by the activities of other agencies, and to concentrate its attention upon specific problems, with the idea of shifting attack from time to time to meet the more pressing needs of research as they develop with increase of knowledge.

Income on investments for the year 1940 amounted approximately to \$1,300,000, and was required almost entirely for support and maintenance of major projects undertaken by the Institution, mostly in the physical and biological sciences. Results of its work were made known through technical and scientific journals, its yearbook, and a series of scientific monographs and news releases. To date the Institution has issued about 750 monographic publications.

The Institution has offered its services to the U.S. Government for co-operation in the national defense program, and a number of contracts have been effected whereby personnel and facilities are being utilized in conduct of special defense proj-

ects, in co-operation with governmental agencies.

W. Cameron Forbes is Chairman of the Board of Trustees of the Institution, and Vannevar Bush is President. Other Trustees are: Thomas Barbour, James F. Bell, Robert Woods Bliss, Frederic A. Delano, Homer L. Ferguson, Walter S. Gifford, Herbert Hoover, Walter A. Jessup, Frank B. Jewett, Charles A. Lindbergh, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Stewart Paton, John J. Pershing, Elihu Root, Jr., Henry R. Shepley, Richard P. Strong, Charles P. Taft, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed Headquarters Sixteenth and P Streets, N.W., Washington, D.C.

**CAROLINE ISLANDS.** See JAPANESE PACIFIC ISLANDS.

**CARPET INDUSTRY.** See RAYON.

**CASTELROSSO ISLAND.** See AEGEAN ISLANDS, ITALIAN

**CATALONIA.** A region in northeastern Spain, consisting of the provinces of Barcelona, Gerona, Lérida, and Tarragona. Chief city, Barcelona. See SPAIN under *History*

**CATHOLICS.** See CATHOLIC WELFARE CONFERENCE, RELIGIOUS ORGANIZATIONS; ROMAN CATHOLIC CHURCH, FRANCE, GERMANY, IRELAND, MEXICO, POLAND, and SPAIN under *History*, VATICAN CITY

**CATHOLIC WELFARE CONFERENCE, National.** The official agency of the Archbishops and Bishops of the American Hierarchy for the promotion of unity in Catholic work, organized in 1919. The "N.C.W.C.," as it is now popularly known, succeeded the emergency National Catholic War Council, one of the seven agencies recognized by the United States Government for welfare work during the World War

The Conference is administered by a Board of Archbishops and Bishops elected at the annual meetings of the Hierarchy held in the Nation's Capital each year. The personnel of the Board, as elected November, 1940, was as follows:

Most Rev. Edward Mooney, chairman of the Administrative Board and episcopal chairman of the Executive Department; Most Rev. John B. Peterson, vice chairman of the Administrative Board and episcopal chairman of the Department of Education; Most Rev. Francis J. Spellman, secretary; Most Rev. Francis C. Kelley, treasurer and episcopal chairman of the Department of Lay Organizations; Most Rev. John Gregory Murray, episcopal chairman, Department of Catholic Action Study; Most Rev. Hugh C. Boyle, Legal Department; Most Rev. Edwin V. O'Hara, Social Action Department; Most Rev. John Mark Gannon, Press Department; Most Rev. John A. Duffy, Department of Youth; and Most Rev. John T. McNicholas, O.P., member of the Board without portfolio. Right Rev. Msgr. Michael J. Ready is General Secretary and Rev. Howard J. Carroll, Assistant General Secretary.

The National Catholic Welfare Conference operates through the above-mentioned Departments (see 1939 YEAR BOOK for details). The Department of Youth was newly set up in 1940. It facilitates exchange of information regarding the philosophy, organization, and program-content of Catholic youth organizations; promotes the National Catholic Youth Council, the federating agency for all existing, approved Catholic youth groups; contacts and evaluates national governmental and non-governmental youth organizations and youth servicing organizations.

At their 22d annual meeting, held in Washington, D.C., Nov. 13-14, 1940, the Archbishops and Bishops of the United States took action on many important matters. They received from Pope Pius XII a message conveying as a pledge of abundant divine grace and guidance Paternal Apostolic Benediction upon the assembly, and cabled a message of filial homage to His Holiness. They also called attention to the appeal of Pope Pius XII for universal prayers for peace on November 24 and, taking cognizance of the Nation's peacetime efforts to defend American institutions, asked the Faithful "to give themselves unstintingly" to their Country's "defense and its lasting endurance and welfare." A plan was adopted looking to the co-ordination of Catholic interests and activities stemming from the Nation's program for preparedness and the unification of all Catholic relief and refugee work. More than \$1,200,000 was reported as provided for the relief of suffering peoples abroad. Close co-operation and encouragement was given to the U.S. Committee for the Care of Refugee Children in its appeal for financial support. The American Board of Catholic Missions was reorganized, and a new National Catholic Community Service was set up, composed of the Administrative Board and the Military Vicar of the Army and Navy Ordinariate. This service was calculated to give life to the Bishops' pledge of loyalty to our Government and the basic ideals of the American Republic. The Bishops' meeting also authorized erection of a new headquarters, indorsed a declaration of standards for religious work in penal and correctional institutions, and authorized observance of "Bible Day" in the spring of 1941

**CEYLON.** A self-governing insular colony of Great Britain. Area, 25,332 square miles, population (1938), 5,780,000. Vital statistics (1938). 208,389 births, 122,299 deaths, and 35,466 marriages. Buddhism and Hinduism are the principal religions. Chief cities: Colombo, the capital, 310,000 inhabitants in 1936; Jaffna, 47,700; Kandy, 40,100; and Galle, 38,000. Education (1938):

792,761 students (average attendance) in the 5952 primary and secondary schools.

**Production and Trade.** The chief agricultural crops are tea (228,539,767 lb. exported in 1939), rubber (62,400 metric tons in 1939), copra, rice, coir, cinnamon, cacao, tobacco, and citronella. Livestock (1938) 1,670,400 cattle, 232,500 goats, 62,500 sheep, 36,700 swine, and 1350 horses. There were 160 plumbago mines working at the end of 1938 and 75,397 tons were exported. Ilmenite and monazite exist in commercial quantities. Small gems such as rubies, moonstones, cat's-eyes, and sapphires are found in the quarries. Trade (1939) imports, Rs242,369,560, exports (including re-exports of Rs22,726,262), Rs326,888,229 (tea, Rs188,029,000, rubber, Rs67,564,000, coconut products, Rs35,596,000). The rupee averaged \$0.3328 for 1939.

**Communications.** In 1938 there were 17,806 miles of highways and 951 miles of railways (including 117 miles of narrow gauge). During the same year, shipping aggregating 12,123,097 tons cleared the ports.

**Finance.** Budget estimates (1939-40) revenue, Rs117,426,650, expenditure, Rs128,952,900. The net public debt on Sept. 30, 1938, totaled Rs214,597,525. In order to meet a deficit of Rs9,464,637 in the 1940-41 budget, increases were made in income tax, sugar tax, and gasoline duty.

**Government.** The administration is headed by a governor who is assisted by a state council of 61 members (50 elected on a territorial basis, 8 nominated unofficial, and 3 officers of state). This state council, which deals with administrative as well as legislative matters, is divided into 7 executive committees in charge of various subjects, and the chairmen of these committees are ministers for the subject concerned. Governor, Sir Andrew Caldecott (appointed Jan 19, 1937).

**Maldivé Archipelago.** A dependency of Ceylon Area, 115 square miles, population (1931 census), over 79,000 Moslems. Capital, Malé.

**History.** For the first time in Ceylon's history a wave of strikes and riots occurred in 1939-40 among Indian laborers on the estates of Ceylon planters. The situation was variously attributed to a newly imposed ban on the immigration of Indian laborers into Ceylon, the rapid rise in the cost of living resulting from the war, and "Communist agitation" among newly enfranchised and largely illiterate estate laborers. In March the planters decided to pay a monthly bonus to regular workers on estates over and above the fixed wage scale, and later negotiations were opened with the Government of India for an adjustment of immigration and other issues. The planters finally agreed to recognize the laborers' right to form unions and bargain collectively.

During a strike riot on the Mooloya estate early in the year, police shot one of the laborers and arrested their ringleaders. At the request of the State Council, the Governor appointed a commission to investigate the riot. The Minister of Home Affairs requested the Inspector-General of Police to postpone trial of the strike leaders until the commission had submitted its findings. When the Inspector-General refused and was supported by the Governor, all the ministers resigned in protest at the end of February. Shortly afterwards the Governor issued a stern warning of the illegality of seeking "to use either labor unions or political associations as an engine of incitement to subversion of established law and order."

The planters and other European interests expressed deep dissatisfaction with recently enacted liberal constitutional reforms and in a joint memorandum asked the appointment of a Royal Commission to study the constitutional problem. As a result of their stand, the election scheduled for not later than January, 1941, was ordered postponed for two years.

**CHACO.** See PARAGUAY under *Area and Population*, BOLIVIA and PARAGUAY under *History*.

**CHAD.** See FRENCH EQUATORIAL AFRICA.

**CHAHAR.** See CHINA under *Area and Population*.

**CHAIN STORES.** See MARKETING.

**CHANNEL ISLANDS.** See GREAT BRITAIN under *Area and Population and History*.

**CHARITIES.** See BENEFACTIONS.

**CHECKERS.** The year 1940 was more than ordinarily quiet in the quarters patronized by lovers and principals of checker games. No national competitions were held, but tournaments of some importance were staged under the auspices of the New York State Checkers Association and the Southern Checkers Association.

The former, at Schenectady, N.Y., was duly won by William F. Ryan of New York City, who is also the champion of the National Checkers Association. The latter contest, held at Hendersonville, N.C., was won by Basil Case of Nashville, Tenn.

Asa W. Long of Toledo, O., continued as champion of the American Checkers Association, the older of the two national checker organizations, and thus was considered by many to be the world's champion.

**CHEESE.** See DAIRYING.

**CHEKIANG.** See CHINA under *Area and Population*.

**CHEMISTRY.** Superpressures, a revolutionary microscope for seeing molecules, more information on tapping the nuclear energy of uranium, another synthetic vitamin, elements No. 93 and up, these are some chemical milestones in 1940.

**Apparatus.** Enormous pressures were achieved during the year. The Aluminum Company of America built a machine for actual plant production which can apply pressures of three million pounds per square inch and yet is so sensitive that it can crush a watch crystal without stopping the watch. Bridgman found that record pressures of three and one-half million pounds did not convert graphite into diamond at room temperature but made the diamond-hard alloy, Carboloy, plastic. In April Goranson and Johnson of the Carnegie Institute of Washington described a pressure apparatus. Oil at 300,000 lb. pressure between two concentric chambers imparted a strength of at least ten times that amount to the inner steel chamber; and with a "cascade" of such chambers, pressures would be limited only by the plastic flow of steel, something which could only be guessed. The apparatus will duplicate pressures 750 miles inside the earth.

At its fortieth anniversary, the General Electric Company Research Laboratories dedicated the first industrial million-volt X-ray apparatus. Three similar machines are already in use in hospitals.

Clark and Shafer exhibited photomicrographs taken of X-ray pictures of metals. The X-rays pass through the specimen, revealing internal irregularities of structure, and obviating the usually careful preparation and polishing of the metal surface. A spectrophotometer described by G. R. Harrison

which automatically graphs the curves and analyzes the spectrum in less than two minutes will undoubtedly find wide application in studying alloys and for special problems such as following the rates of biochemical reactions

An ordinary X-ray tube operates at less than an ampere C. M. Slack of the Westinghouse Lamp Division has devised a special tube operating at 2000 amperes, making possible exposures short enough to photograph the passage of a bullet through wood. See also PHOTOGRAPHY, under *Applied and Scientific Photography*

**Archaeology.** The reading and photographing of cuneiform tablets of ancient Babylonia are facilitated by dusting the surface with powdered ammonium chloride, according to N. C. Debevoise

To assist artists in choosing durable oil paints the National Bureau of Standards is classifying artist's paints as regards color, quality, durability, and nomenclature

The world's oldest steel weapon, dating from 1500 B.C., a battle-axe mounted in a beautifully ornamented bronze socket, was unearthed by the French Archaeological Expedition to northern Syria

**Astronomy.** Cunningham's comet which made its appearance at the end of this year contains hydrogen in its atmosphere. This element has never before been associated with comets

Researches at the Mount Wilson Observatory indicate that the compounds CH and CN exist in interstellar space. Hitherto elements only, such as calcium, sodium, potassium, and titanium had been detected

"Forbidden lines" in the spectrum is one of the astronomer's great gifts to the chemist. For example, the gaseous metallic jackets surrounding the stars at temperatures well above the boiling point of iron emit forbidden lines which are not attainable on the earth, and a study of them contributes to our understanding of the structure of metallic atoms. Similar forbidden lines are found in the northern lights, a phenomenon which was reproduced this year by J. Kaplan who passed an electric discharge through nitrogen gas at a few millimeters of pressure. Other forbidden lines of oxygen were pronounced responsible for the spectral lines previously assigned to the hypothetical element "nebulium" in the sun

**Atomic Energy.** The public became speedily aware of the significance of uranium fission as an inexhaustible source of energy for man. Recognition of uranium 235 as the source of this energy, and current progress on this vital problem is reported under PHYSICS. Other nuclear research is reviewed under this same heading.

**Electron Microscope.** The scientist today stands at the threshold of a vast new world of chemistry opened up by the electron microscope (1938 YEAR BOOK, pages 136, 622). The ordinary microscope reveals clusters of several thousand molecules, and its resolving power can be increased by using shorter wave lengths of light. Electrons behave like light of very short wave-length, and therefore, in 1926 when E. Busch showed that a beam of electrons can be focused by electric and magnetic lenses, just as a light-wave is focused by a glass lens, many scientists turned their energies into developing a microscope using electrons. E. Rupp (1928), V. Zworykin (1929), and Davison (1931), described electrostatic focusing machines. The first compound magnetic-lens microscope was built by Ruska (1932) in Germany; and

in 1934 L. Marton at the University of Brussels used a similar machine in biological studies. Other machines have been erected at Toronto by Burton, Hillier, and Prebus, at the Eastman Kodak Laboratories by Prebus, for Siemens and Halske in Berlin, by Ruska, van Ardenne, and Brueche, and in Metropolitan-Vickers, England, by Martin

Zworykin, Hillier, Marton, and Vance, the latter designing the intricate electrical circuits, developed a machine in the RCA laboratories at Camden, New Jersey, which was put in commercial production at a price of \$9500 in July, 1940. The first instrument was delivered in December to the American Cyanamid Company for research on pigments in the paper industry

The electron microscope differs from the ordinary microscope in that it focuses electrons with magnetic lenses instead of focusing visible light with glass lenses. The electrons are generated from a tungsten filament, accelerated to 30,000–60,000 volts in an electric field, and focused upon the sample just as light is focused above the stage of an ordinary microscope. The object—for example germs too small to be studied in an ordinary microscope—is mounted in a film of nitrocellulose a millionth of an inch thick supported on a fine wire cloth. The RCA instrument is so simplified that it is almost automatic. Samples may be examined in rapid succession, for although the entire apparatus must be evacuated to  $10^{-4}$  mm pressure, air-locks are provided so that air is admitted to only a small isolated chamber in the apparatus when changing samples. The electrons pass through the sample, and through a magnetic field to a fluorescent screen where an image 100 times the size of the original object is formed. This image is further magnified to 20,000 diameters by a projection coil, similar to that used in television. The picture so obtained is called an *electron micrograph*, to distinguish it from *photographs* taken with photons. Portions of the electron micrograph may be photographically enlarged to 100,000 diameters. Magnifications greater than this do not improve the resolution. In contrast, the electron microscope at 100,000 diameters gives as good resolution as the ordinary microscope gives with magnifications of 1500. An ordinary microscope can examine particles 1500 angstroms in diameter; the electron microscope can go down to 30 angstroms. Since an atom is of the order of two or three angstroms, the present instrument is on the threshold of the world of atoms. It readily photographs individual molecules of large proteins, such as the tobacco mosaic virus

Some excellent work has come from Ruska, van Ardenne, and other German workers this year. They investigated mine dusts, for health protection. Ruska examined the adsorption of red colloidal gold on tobacco mosaic virus, showing that the gold sol is held so tightly below pH 4.5 that it does not aggregate, as it normally does, upon the addition of sodium chloride. Micrographs of giant protein molecules were also made, including the single molecules of hemocyanin from the blood of mollusks, and edestin particles from vegetable oils

Stuart Mudd at the University of Pennsylvania, collaborating with the RCA Laboratories, studied the structures of a number of germ cells too tiny to be examined under the ordinary compound-microscope. He reported continuous rigid membranes binding streptococcus germs in long chains, the structure of the long curved flagellae on typhoid germs, and curious internal structure in whooping-cough germs. H. Morton and F. Anderson reported

the production of tellurium crystals by the reduction of tellurites within diphtheria bacilli, some of the crystals piercing the walls of the bacilli. W. H. Stanley and F. Anderson micrographed tobacco mosaic virus.

Many industrial products are yielding the secrets of their molecular structure to the electron microscope: synthetic fibers and plastics, soap films and colloidal carbon, silver and gold sols. Electron microscopes have been used both in Germany and in the United States to study the formation of the photographic image and the mechanism of grain-development, with a view toward producing fine-grain films. Under this enhanced magnification it is seen that the so-called silver "grain" looks more like a clump of seaweed than a nugget or grain.

The scientist stands before a new, unexplored field of molecular research.

M. Ploke of Dresden has assigned to Zeiss Ikon A.-G. an electron microscope in which the electron beam is generated by the object itself. X-rays are allowed to impinge upon the sample, and the electrons which are thereby emitted are focused upon a television transmitting surface, where they may be subsequently amplified. The object does not need to be evacuated as in the electron microscope. Ploke also described a microscope using X-rays instead of visible light.

**Isotopes.** Valley and Anderson found that the abundance of the stable isotopes of iron are the same in meteoritic and terrestrial iron.

Concentration of heavy isotopes continues. Urey described the concentration of heavy sulphur,  $^{34}\text{S}$  by interchange between sulphur dioxide gas and a water solution of sodium bisulfite, at a cost of \$1500 per oz. It is to be used in tracing the course of sulphur compounds through the body. Urey has also employed exchange reactions using the zeolites. In a patent covering this use for zeolites with a view to the possibility of concentrating uranium 235 for tapping atomic energy (see PHYSICS), J. G. Dean of the Permutit Company revealed how heavy potassium, lithium, and nitrogen can be obtained by such interchange reactions.

Radioactive isotopes produced in the cyclotron have been used for a number of biological studies this year. Radioactive calcium in the bones and teeth was studied at California. The distribution of radioactive phosphorus in various portions of the brain was studied by Charkoff, Fries, and Changus; the greatest drop in the concentration of phosphorus occurs in the spinal column soon after birth. Kistiakowsky and Cramer prepared radioactive lactic acid containing  $^{14}\text{C}$  in the carboxylic position. Radioactivity was sufficiently strong to follow the course of the lactic acid in biological experiments for five hours.

With their million-volt X-ray machine, M.I.T. scientists have produced three new radioactive forms of indium. One of these isotopes has a half-life of four hours, making it suitable for medical use; but another has a half-life of only 12 seconds. Radioactive yttrium made in the cyclotron from strontium has a half-life of 100 days, considerably longer than most artificial radioactive substances. This will make it suitable as a source of gamma rays in the laboratory. In fact, C. Pecher has already made a quantity of it equivalent to 25 milligrams of radium for use in taking gamma-ray (X-ray) photographs of airplane parts to discover internal defects.

Radioactive  $^{14}\text{C}$  was obtained by bombarding ammonium nitrate in the cyclotron. This may prove

an important material, since it has a half-life of 1000 years, compared with radium, 1590 years; and therefore it has a radiation activity a little greater than radium.

**Molecular Films.** The use of thin films to eliminate glare (1939 YEAR BOOK, pages 123, 322) has found its way into the lens industry. The camera and projection lenses are etched on their exposed outer surfaces and fluoride-coated on their inner surfaces.

Langmuir demonstrated a number of interesting properties of mono-layers on water. A thin sheet of plastic held a sixteenth of an inch above a tray of water became limp from the water vapor. If a monomolecular layer of tricosanic acid were first spread upon the water, however, the plastic remained rigid since the mono-layer kept the water from evaporating. In another experiment a mono-layer of oleic acid extinguished a tray of burning ether-and-water, not because it kept oxygen away, but because it prevented rapid motion bringing fresh ether to the surface. Also, Langmuir showed how a colored mono-layer of olive-oil on water became invisible as the oil aged, and suggested a quick method for measuring the extent to which the oil is oxidized by measuring the amount of new oil which must be added to restore the color of the films.

W. D. Harkins described the peculiarities of two-dimensional systems on water. As a film of pentadecylic acid was compressed, it contracted from a gas to a highly compressible liquid, and finally to an incompressible solid, all in two-dimensions. There was no heat of fusion for this peculiar two-dimensional solid; but the heat of expansion of the two-dimensional liquid was very great.

**New Substances.** No longer are there 92 elements. This has often been falsely heralded; but with some authority in the *Physical Review* for June, 1940, McMillan and Abelson confirmed the experiments of Fermi made several years ago in discovering element 93  $^{238}_{92}\text{U}$  bombarded with 25-volt neutrons produced  $^{239}_{92}\text{U}$  which is radioactive, half-life 23 minutes. The disintegration product is  $^{239}_{93}\text{Np}$  or element number 93 in the periodic table. This is the reaction discovered by Fermi in his original experiments with uranium which led to the tapping of nuclear energy (see PHYSICS, under *Nuclear Energy*). Element  $^{239}_{92}\text{U}$  is itself radioactive, with a half-life of 23 days, and probably disintegrates into another new element  $^{239}_{94}\text{Pu}$ . Still other heavier elements may be discovered as research progresses. In the same issue of *Physical Review* a group of Japanese scientists also announced element number 93 from uranium bombarded with fast neutrons.

Lane, reporting for Wahl of Helsingfors, postulated the existence of a fourth series of radioactive substances present in very old geological minerals, of which an element of weight 237 is a member.

Cut off from supplies of amino-acids from Germany and Switzerland, laboratories and medical clinics have increased their demand for those of the 23 rare amino-acids manufactured at the University of California. Manufactured from glue, human hair, cottage cheese, dried blood, etc., some of them so difficult to prepare that they cost \$1000 a lb., these rare acids are in constant demand for medical research on baldness, cancer, muscular diseases, and gastric ulcers; also as flavorings for soups and gravies.

Another vitamin, the eighth to be synthesized by chemists, was announced by the Merck Laboratories. Named pantothenic acid, from the Greek meaning "everywhere," this new product is universally present in animal tissue, including man. R. J. Williams partially synthesized it in 1933 and Elvehjem identified it with the chicken antiskin-infection factor. Collaboration between Williams and the Merck Laboratories led to the present accomplishment.

One of the most important food-forming processes in nature has been duplicated this year in the Cambridge Laboratories by C. S. Hanes. Glucose containing phosphorus was transformed into starch under the action of phosphorylase enzyme. The synthetic starch shows the usual reactions of natural starch: grain-structure, iodine blue reaction, and reversion to glucose upon acid hydrolysis. Twenty grams of the new synthetic starch has been prepared.

**Research Activity.** As a rough index of the research activity in different countries, the American Chemical Society released interesting statistics on the number of articles selected for *Chemical Abstracts* during the past quarter-century. The figures for the number of abstracts for the years 1913, 1929, and 1939 respectively are for the United States, 3940, 7498, and 12,615; for Germany, 6539, 7841, and 8503, for the British Empire, 2741, 3929, and 6423 of which 4776 came from Great Britain, for Russia 474, 990, and 5063, for France 2481, 2045, and 4142; and for Japan 71, 1079, and 2029. Most significant changes in these figures, calculated as percentage of abstracts from each country, is the drop from 1913 to 1939 by Germany from 18.4 to 34.4; and the rise by Russia from 2.5 to 19.9. Most countries did not change considerably percentage-wise, the figures for 1939 being the United States 27.5, the British Empire 14.4, and France 13.0. Prewar suppression of publications on important research may well impair the significance of these figures, however.

**Awards and Medals.** The American Chemical Society Award in Pure Chemistry for 1940 went to L. O. Brockway for his electron diffraction studies of molecular structure. The \$1000 was provided by Alpha Chi Sigma. E. G. Ball received the Eli Lilly and Company Award in Biological Chemistry for his studies of the oxidation-reduction properties of cell pigments, adrenaline, Vitamins C and B<sub>2</sub>, and nicotinic acid amide. Some of his best work has been on the enzyme xanthine oxidase. This enzyme brings about the oxidation of purines to uric acid; and during the research Ball obtained a preparation related to Vitamin B<sub>12</sub>, thus establishing another role for Vitamin B<sub>12</sub> in biological oxidations.

Franklin Institute awards were as follows: the Longstreth Medal to L. Godowsky and L. Mannes for development of Kodachrome, and to G. Slayter for improved methods of spun and blown glass filaments, the Levy Medal to C. Rosenblum and J. Flagg for their paper on artificial radioactive indicators; the Cresson Medal to F. Becket for process development of low carbon ferroalloys, and to R. R. Williams for his researches on Vitamin B<sub>12</sub>; and the Franklin Medal to Leo Bakeland for his well-known plastic.

R. E. Gibson received the Hillebrand Prize Award for his work on the behavior of solutions under high pressures. To W. H. Sebrell for his discovery of the cure for the sometimes blinding disease keratitis, and to a five-man team at the

Merck Laboratories, who synthesized Vitamin B<sub>12</sub>, went the Mead, Johnson and Company \$1000 award for advances in the knowledge of the Vitamin B complex. Linus Pauling has been announced as the 1941 Nichols Medalist, in recognition of his distinguished and pioneer work on the application of quantum mechanics to chemistry, and on the size and shape of chemical molecules.

See ASTRONOMY, BIOLOGICAL CHEMISTRY; CHEMISTRY, INDUSTRIAL, PHOTOGRAPHY; PHYSICS. HUBERT N. ALYEA.

**CHEMISTRY, Industrial.** The astonishing variety of synthetic plastics, fibers, rubber, and textiles expanded in 1940.

**Canada Rearms.** Forty-five hundred professionally trained workers in 1000 laboratories with an annual outlay of \$14,500,000 are participating in the half-billion dollar chemical war-expansion program. This includes the erection of a munition plant, Britain's largest, at Fraser, Ont., a \$8,000,000 ammonium nitrate plant using Albertan natural gas, and a \$1,500,000 nylon plant at Kingston, Ont., utilizing imported nylon polymer.

The government uncovered large magnesium ore deposits, developed ferro-uranium steels, hydrogenated peat with 77 per cent yields, and studied cold-packing of fruit. It is standardizing and centralizing extraction of cod-liver oil, 200,000 gallons yearly from Nova Scotia. Oil exports were forbidden after September. New methods for storing liver in isolable communities may elevate Newfoundland's importance in the industry. Whaling operations, resumed in 1940, resulted in a catch of 219 whales yielding 132,000 gallons of whale oil, 269,000 gallons of sperm oil, 181 tons of bone meal, and 434 tons of fertilizer. On the west coast 850,000 gallons of pilchard oil were produced for native consumption.

The Canadian Pulp and Paper Association emphasized the importance of wood research. Pulp and paper has increased from 400,000 tons in 1914 to 4,300,000 tons in 1939. Wood has been completely hydrogenated into liquid cyclohexanol-like products.

The cinnabar deposits discovered in British Columbia in 1937 yielded 36,000 standard flasks of mercury for fulminate detonators during the first half of 1940, a considerable achievement when it is recalled that the entire 1939 world output was only 160,000 flasks.

The most important item from **Central America** was the continued activity in **Cuban manganese** ore which supplied the United States with one-fifth of its needs for special steels. A plant for extracting chemicals from sea water commenced operations near Havana. A consolidating law on medicinals, 64 per cent of which was supplied by the United States, was put into effect. Approximately a million dollars worth of chemicals reached **Nicaragua**, the **Bahamas**, and **Haiti** from the United States. German imports heretofore amounted to from 10 to 20 per cent. **Mexican mercury**, produced in crude peasant stills, soared in price from \$75 in 1937 to \$200 in 1940, while production rose correspondingly from 170 tons to over 600 tons. This reflects efforts by Germany and Japan to stock-pile mercury for fulminate detonators.

The **Chinese Industrial Co-operatives** are rapidly decentralizing chemical industry. Chemical journals resumed publication. The universities are scattered inland as a protection against bombings;

and research, directed entirely toward military and economic needs, is handicapped from want of ordinary chemical reagents. Motor fuel from vegetable oils is produced in three localities. The Yung Li Co., foremost chemical company, will operate a Solvay soda plant with Szechuan natural brines. China supplied 15 per cent of the silk imported to the United States in 1940, 8 per cent in 1939.

**Egyptian** exploitation of resources has progressed. Nine governmental research centers, one for chemistry, have been created. Plate-glass and sardine-canning industries are to be established. A 500,000-ton tin deposit was discovered. Phosphate rock valued at 500,000 Egyptian pounds was mined in 1939, and 4000 metric tons of caustic soda was obtained from natural carbonates occurring 70 miles northwest of Cairo.

**German** industry is completely mobilized, and research is co-ordinated at the House of German Research in Berlin-Dahlem.

Youth organizations gather plants previously imported for *drugs*. Sodium dibromophenol sulphate replaces Chilean iodine in hospitals, where iodine is reclaimed from old swabs. Iodine as well as silver is also reclaimed from photographic films. Vitamin C and D tablets are administered to children under governmental supervision. One-fifth of the food storage is by quick-freezing. Production of fats from petroleum reached 35,000 tons yearly.

Motor fuel probably reached 6,000,000 bbl., up 50 per cent over 1939, and of this, 500,000 bbl. came from Alsatian fields exploited since the capitulation of France. Diesel-engined airplanes were rumored. English reports on captured planes rated most German gas at 64-octane, none above 85-octane. Forty thousand cars operated on liquid propane-butane. Petroleum was forbidden in cosmetics and putties.

The death penalty enforces the gathering of scrap metals—zinc, aluminum, and magnesium alone being exempt. Glass, enamelled-iron, and plastics replaced metals, although there are restrictions on plastics from phenol which is the raw material for picric acid explosive. Lead has been requisitioned from the storage batteries of unused cars. The government has offered \$4000 for a battery containing neither lead nor nickel, such an invention would have far-reaching consequences in relieving fuel consumption. Research intensified on plastic powdered metals, aluminum-magnesium alloys, and the recovery of vanadium from Bessemer slag.

A *nitrogen* supply of 1,500,000 tons annually, itself probably adequate for hostilities, was augmented by the 450,000-ton capacity of conquered Belgium, Norway, and the Netherlands. Nitrogenous fertilizer quotas of 85, 115, and 100 per cent of prewar consumption were allocated the Old Reich, Austria, and Sudetenland. Potash companies are diversifying their interests, for example, the chief operator has also entered the petroleum and magnesium fields.

Search for *textile* raw materials continues. Italian cane cultivated near Vienna is claimed to yield 10,000 lb. of fiber per acre, in contrast to 200 lb. for cotton. Plastic substitutes flooded the market; of these, cellulose acetate for transmission belts was pronounced especially successful.

Many restrictions have been proclaimed: on cuprous insecticides, on sulphur for vineyards, on borax for beet diseases; curtailment of phosphate fertilizers to 25 per cent the 1939-40 quota, for Germany has depended chiefly upon Florida phosphate rock; decrees to check a flood of worthless

soap substitutes which came at the beginning of the war, abolishing trade names and requiring the admixing of 15 to 45 per cent of sodium silicate in washing soda; and prohibition against packaging common commodities such as soap.

The demand for calcium carbide for synthetic rubber, plastics, fibers, and solvents is so great that it is difficult to meet. Since a 150-ton calcium-carbide electric furnace consumes 30,000 kilowatts daily, Germany with insufficient hydroelectric power is forced to produce its electricity from coarse lignites.

By 1940 **Great Britain's** chemical industry was on a wartime footing. Key Import Duty licenses were strictly applied.

A newly created Secretary for Petroleum has initiated six lines of *fuel* research: low temperature coal carbonization, high temperature carbonization, liquid products, substitute fuels, colloidal fuels, and efficient use of fuels. Private motor cars are beginning to use sewage and coke-oven methane, natural gas in Scotland, and producer gas.

*Metal* research is intense. Britain lost 72 per cent of her iron supply from the continent, although 16 per cent still comes from Spain. The new X-ray and metallographic Tin Research Laboratories in Middlesex are investigating tin coatings and bearing metals. Metal news includes 30 new plants for treating colliery effluents; Bright-ray, a 80-nickel-20-chromium steel for aircraft engines, Vulcoferan, an ebonite lining for steel, domestic ferroalloys, formerly imported from Norway, and electro-deposition of white bronze.

*Textile* news includes resin impregnations for transparent and fluid-impermeable fabrics, stiffness and transparency imparted to cotton by ethylene oxide, use of the Italian Pomilio process for paper pulp from grasses, nylon bristles by the ICI, although yarn production has been postponed, and a dyestuffs industry 8-fold greater than in 1914, meeting 90 per cent domestic textile demands.

Miscellaneous notes include development of native barytes for paint, latex paint or cellophane tape to protect windows from bombs, seventeen new flexible resin substitutes for glass, water-soluble melamine resin powders, hot-spray shellac, Distrene and Polythene resins, extended applications of cellulose esters and ethers, potassium dichromate-mercuric chloride wood preservative containing sodium nitrite or sulphite to prevent corrosion of steel, fire-resistant electric household wiring, a peanut-oil substitute for cod-liver oil, potassium metabisulphite tablets for preserving fruit at home, and paper wrappings impregnated with 35 parts of hexamine to 170 parts of o-phenylphenol for preventing green-mold on citrus fruits.

The government-sponsored rise of **Greek** chemical industry slumped badly, since 60 per cent of its raw materials are imported. Soap, alcohol, and naval stores are the only wholly domestic commodities.

In **Hungary** the exigencies of war have increased employment 27 per cent in the petroleum, aluminum, and iron industries. There are 96,500 men employed. News items included a new 10,000-ton aluminum plant, Budapest using sewage and coal waste methane, and a semi-plant production of cellulose from cornstalks which has interested German capitalists.

An opportunity to capture **India's** huge chemical market, \$36,000,000 in 1939, is open to America for a number of years to come. At present chemical exports are virtually banned. Twelve important in-

#### HYDROGEN ATOMS AFTER COLLISION WITH NEUTRONS

A cloud chamber photographed in 1/100 second by Dr. F. N. D. Kurie showing the great activity caused by a neutron beam from the cyclotron at the University of California. The test chamber was six feet from the giant machine.

SYNTHETIC RUBBER

# THE R C A ELECTRON MICROSCOPE

*Left* Seated at the microscope is its designer, James Hillier, who worked under the supervision of Dr. V. K. Zworykin (standing), the Associate Director of the R C A Electronic Research Laboratories. *Center:* Diagram of the principles of the microscope, electrons are focussed with magnetic lenses, just as glass lenses focus light with an ordinary microscope. *Upper right:* Structure of the silver grains in a photographic image, showing undeveloped silver bromide crystals and filamentary silver produced by developer action. Magnification x 40,000 diameters. *Courtesy, Kodak Research Laboratories.* *Lower Right:* Bacillus Subtilis, magnification x 23,000. At the left a bacillus is degenerated and is dissolving. Neither the structure nor the degeneration is revealed in the ordinary microscope. *Courtesy, R C A Laboratories*

dustrial chemicals will be in production by 1941. The United Provinces and Bihar, which consume one-tenth the gasoline of India, passed bills in 1939 and 1940 requiring that 5 to 20 per cent power alcohol be added to all gasoline. The potentialities of this movement are apparent when it is realized that 1,500,000,000 gal. of power alcohol could be produced from surplus molasses each year. Drug legislation has been consolidated into a single bill. A new tough hybrid of bamboo and sugar cane may well revolutionize the sugar industry. The electric power industry is expanding, attention being given to electrochemical industries. Four native-fish oils 3 to 19 times more potent than cod-liver oil were reported. The 1939 government report advised aluminum stearate for keeping red lead particles from settling in the paint can; substitution of native pyrolusite for a portion of the artificial manganese dioxide in dry cells; and 15 per cent of molasses to increase tensile strength in lime-cement mortars.

Italy is attempting to develop zinc, lead, manganese, antimony, copper, iron, and mineral combustibles in Sardinia, mercury, iron, marble, and lignites in Tuscany, mercury, bauxite, and coal in Veneto; and iron and anthracite in Piedmont.

Food requirements are carefully controlled. Sugar rations for each person are 500 grams per month. Beets formerly used for alcohol have been diverted to sugar production. Prizes had been offered to increase the cultivation of beets, and importation of saccharin has been prohibited. Garoglio and Ciferri have made preliminary studies on the industrial production of fats from carbohydrates by the use of microbes, their method overcoming the necessity of the large surfaces required in the German process. Saponifiable fats are being extracted from coffee grounds. Soapmaking fat, 75,000 tons annually, is under governmental distribution. 85 per cent for laundry soaps, 10 per cent for medicinal soaps and dentifrices, and 5 per cent for shaving and toilet soaps.

The exploitation of coal and lignite for fuel continues, with an expanded program of 7,000,000 tons for 1944. Three new pits, 1,000,000 tons each, are to be opened up. Leghorn and Bari are producing aviation fuel, lubricating oils, and paraffins, and production of isopentane is being considered. A new source of methane, discovered in February at Pietramelara, will possibly replace 4,000,000 liters of gasoline a year. Motor fuel must contain 20 per cent power alcohol.

Aluminum production, 40,000 tons in 1940, will be increased to 50,000 tons by a new plant just opened up. Six thousand tons of magnesium are expected for 1941 from new factories now under construction in Northern Italy. Substitution of copper oxychloride has saved 35 per cent of the copper consumed. Although Italy makes 1,000,000 tons of steel from domestic ore, the program calls for two and one-half times that production.

The first butadiene rubber factory went into operation in 1940, and two more factories will be in operation by 1941. One plant is to locate at Umbria, near the undeveloped lignite resources. Glyptal, acrylic, and vinyl resins have appeared. The Talgius process for making direct photographic reproductions of costly woods on plywood has been pronounced successful.

The hostilities in Europe were a severe blow to Japanese chemical industry in 1940. Half of her sulphite pulp comes from Scandinavia; and Manchurian pulp production has been held up by the

limited capacity of the trans-Siberian railroad for delivering German equipment in return for Manchurian soybeans. The loss of cryolite from Greenland will seriously hamper Japan's aluminum industry, since the German synthetic cryolite is no longer obtainable. Sixty per cent of Japan's industrial salt for making lye for the rayon industry came from East Africa. Although the Japanese are negotiating trade relations with South America, it does not seem likely that Japan can supply the process equipment which South America will need. Actually, Japan leans most heavily on the United States, who obligingly supplied her in 1939 with 55.7 per cent of Japan's imported war goods, despite the "moral embargo" of June 11, 1938. The 1940 embargoes on solvents, copper, and machine tools (July 2), aviation fuel (July 26), and scrap iron (October 16) finally cut off Japan from the mainstay of her war imports. She does not need cotton for explosives, for her reopening of the natural camphor trade in 1940, despite the synthetic product, will furnish the necessary explosives. The largest Japanese investment is in rubber plantations, producing 10,000,000 lb of crude rubber and latex annually.

Nitrogenous fertilizers are to enjoy a \$50,000,000 expansion over the next two years. The first shipment of ammonium nitrate from China arrived in 1940. Manufacturers were turning from ammonium sulphate to ammonium nitrate because of the sulphur shortage. Fifty per cent of the United States phosphate rock formerly went to Japan, who is now planning to mine 90,000 tons of apatite in Korea each year. She is also turning to Korea for 100,000 tons of potash alum to replace the potash supply from Germany and Palestine.

The fuel program has lagged. Less than 500,000 tons will be produced by 1941, one-quarter the figure called for by the five-year plan. The 30,000-ton Fischer-Tropsch plant at Kyushu produced only 1000 tons this year, and it is assumed that the largest unit, 52,000-tons at Chinchow, did no better. The 600,000,000-yen investment in coal liquefaction is chiefly for low-temperature carbonization, and the large semi-coke by-product will be popularized for automobile producer-gas. Polymerization units for aviation fuel have been erected for the Mitsubishi Oil Company by Universal Oil and Tide-Water, the latter having a 50 per cent interest in Mitsubishi. Output will be so small, however, that Japanese firms are preparing to manufacture tetraethyl lead as soon as the last American patent expires in June, 1941. Because of the shortage of coal, steel works substituting it as bunker fuel were instructed to revert to heavy oil. Soybean oil was evaluated as a Diesel fuel. Furfural, a solvent for aviation lubricants, is being made from rice straw, 17 per cent of the straw being recovered as 99 per cent furfuraldehyde.

The soap industry is virtually self-sufficient, using hydrogenated sardine oil; 62 per cent of this is for soap, 21 per cent for glycerine, and 17 per cent for wax. Thirty-three thousand tons of explosives are produced in Chosen from this glycerine, in which Japan is self-sufficient. A guild of sodium silicate manufacturers will control their 80,000-ton annual product. Manchukuo grew 4,500,000 tons of soybean in 1940, 60 per cent of the world crop.

The textile industry is in the doldrums. Shortages of salt and pulp have created stagnation in the rayon industry, export of which was half that

of 1937. Carbon disulphide production, too, was inadequate for the viscose demands, the electric power necessary to manufacture carbon disulphide having been diverted to wartime electrochemicals. Patents are paying little attention to viscose and concentrating on fibers from soybean protein, casein, and fish protein. The advent of nylon has caused considerable concern and foreshadows intense governmental research. Thirty years ago Japan met a similar announcement about rayon by building up the largest rayon industry in the world. The answer is not as simple this time, for foreign companies are reluctant to divulge their processes in detail. Silk stock surpluses were so large that the government ordered the admixing of 20 per cent silk with all other fabrics after Oct. 1, 1940. New fibers included a wool-like acetate rayon costing 50 per cent more than ordinary rayon; Silkool and Sova wool, soybean-protein fibers; and three fibers in experimental production: Kanebiyon-60, a vinyl fiber substitute for silk; Kanepylon-60, a viscose-soybean protein substitute for wood-pulp; and Kaneralia-60, a rayon substitute derived from Korean and North Chinese reed-pulp mixed with an undisclosed acetylene derivative. Sample hosiery made with these synthetics compared favorably with nylon excepting in wet-strength. A hemp substitute was reported from banana skins, 4,000,000 lb. of which are available yearly.

The islands of the Pacific are being explored for mineral wealth. In **Australia** vermiculite, mercury, phosphates, and dolomite were uncovered, and oil shales are expected to yield 10,000,000 gal. of gasoline yearly. Synthetic ammonia, phosphate, and Solvay plants began operation in 1940. Power alcohol in Queensland is to be tripled to 4,000,000 gal. a year. A substantial export market for soap has been built up. Alkyd resins, ramie cloth, and an unshrinkable wool made their appearance. The **Netherlands Indies** retained their position of fifth most important crude-oil producer in 1939, 2.8 per cent of the world's total. Royal Dutch Shell controls 56.5 per cent of the output. **New Zealand** sulphur imports were up 50 per cent over 1939. Synthetic fibers were produced from bagasse by the Pomilio process in the **Philippines**; adsorbent charcoal was manufactured from rice hulls and coconut shells; and the economically important nickel-chromium ores were further examined.

Intense **Russian** activity in diversified industrial fields attests a growing, if not yet thriving, era of chemical industry.

Food quotas for 1940 included 23,000,000 tons of beet sugar and 3,000,000 tons of potatoes. Caffeine is being extracted with ethylene chloride from Georgia tea dust. Nitrate, potash, and phosphate fertilizer output are to be doubled by 1942.

Widespread metallurgical research included chromium-silicon, and chromium-manganese alloys, cast magnesium alloys, nitrocementation of steels, anticorrosion films with silico-organic compounds, and alloys of aluminum with titanium and chromium. Low-grade tungsten ores in Siberia have not been worked, and aluminum production has lagged from lack of ore and electric power.

By-products of butadiene rubber from grain and potato fermentation were investigated, also, chlorinated transformer oils, synthetic tannins, sunflower oil substitute for linseed oil in alkyd lacquers, and cracking of methane to acetylene by the electric discharge.

In **Scandinavia**, **Denmark** abandoned its superphosphate and sulphuric acid industries for lack

of raw materials. **Greenland** cryolite is under the protection of the United States. The German I. G. is exploiting the nickel deposits in northern **Finland**. **Norway** oil-whale for the 1939-40 season amounted to 909,200 bbl. Germany did not participate, Great Britain and Norway sending 10 expeditions each, Japan 6, and Panama and the United States 1 each. A plant at Oslo is studying the electrolytic recovery of potash from sea water. With her 9,200,000-kw water power **Norway** ranks high as an aluminum producer, 40,000 tons annually; and abrasive industries are contemplated. **Sweden** has mobilized 100,000 workers for defense. In a new oil laboratory at Nynashamn the Bergius and Fischer-Tropsch processes are being examined; although the fermentation of sugar in sulphite pulp-liquor holds more promise, representing a potential source of 200,000,000 liters of power alcohol. Ten thousand wood-gas and 15,000 charcoal-gas automobiles operate in Stockholm. Superphosphate operations continue at full scale. An institute for organic chemical research was inaugurated in Stockholm this summer, with biochemist Hans V. Euler as director.

In **South Africa** the United States may find a market for dyes, medicinals, superphosphate fertilizers, and sulphur; while potential native industries include sugar, fermentation, and coal products.

**South American** products normally exported to Europe were diverted to the United States in 1940. The **Argentine** vegetable-oil production has increased 248 per cent during the past ten years. The first pilot-plant batch of coffee-plastic was made in November, 1940. Universal Oil and Foster-Wheeler are installing a Dubbs petroleum-cracking unit in Rio de Janeiro.

The birth of **Brazil's** chemical industry is expected to occur from the necessities of the current war, just as its other industries originated from the exigencies of the World War of 1914-18. The Instituto Nacional de Tecnologia, created by the government to develop Brazilian raw materials, and the important industrial research organization Instituto de Pesquisas Technologicas, are contributing much to this national advancement. Experts were brought from the United States to inspect the iron, chromium, manganese, and petroleum resources; and Brazilian commissions visited the steel and Georgia pine factories in the Northern Hemisphere.

By law, imported products must be blended with coal; with 1,000,000 tons manioc flour, and with 10 per cent of jute substitute, mostly caraoa from the dry northeastern portion of the country.

New projects include a fifth Dubbs cracking unit for Brazil, 4000-bbl. capacity, to be built near Nictheroy; a 10,000-ton superphosphate plant; and treatment of 5 per cent nickel deposits, and argentiferous galena, in São Paulo. Bauxite transportation costs still inhibit aluminum production. Native castor-oil mixed with mineral oil and triethanolamine is used as a lubricant. Cultivation of a native tree which yields a fatty oil, bati-fat, has been urged. A plastics-from-coffee plant is under construction. Henry Ford invested \$9,000,000 in native rubber trees in 1928, and is considering another \$20,000,000 investment.

All chemical groups of the country were merged into a single group patterned after the American Chemical Society whose by-laws were copied. Another society was formed in September with aims similar to the American Society for Testing Materials. A large number of German manufacturers

belong to the new society. By national edict the professions of chemist, engineer, physician, and so forth are limited to native-born Brazilians. Loss of Chile nitrate trade to Europe was more than offset by increasing shipments to Japan, the United States, and Egypt. Chile hopes to capture the 25 per cent fertilizer imports of the United States. Coal-tar dyes will probably become a native industry, since 88 per cent was supplied by Germany, only 1 per cent by the United States. Ecuador produces large quantities of ethanol.

Spain is giving greatest consideration to nitrogenous fertilizers. Cestor, a government organization, plans to fix 10,000 tons annually; and provisions are also made for a nitric acid plant. The olive-oil crops reached 350,000,000 liters this year, up 10 per cent. Potash shipments to the United States have been renewed.

United States. Butadiene rubbers, synthetic fibers, and plastics dominated the industrial field in 1940. In the closing months of the year the government embarked upon an enormous expansion program in explosives, metals, and other strategic materials.

**Explosives.** Contract awards were \$15,000,000 to DuPont for an ammonia plant near Morgantown, W. Va.; \$11,132,440 to Allied Chemicals and Dye for a similar unit at West Henderson, Ky.; \$6,500,000 to TVA for Muscle Shoals rehabilitation; \$20,000,000 to treble the TNT and DNT duPont plant at Wilmington, Ill.; \$14,000,000 to Procter and Gamble for an ammunition-loading factory at Milan, Tenn.; and \$11,000,000 to the Trojan Powder Co. for a TNT plant at Sandusky, Ohio. DuPont plants near Louisville, Ky., will soon turn out 200,000 lb. of smokeless, flashless, non-hygroscopic Army powder per day, tripling national output.

The consumption of explosives during the present war is greater than heretofore since airplane bombs carry considerably more explosive than artillery projectiles, 60 and 20 per cent respectively. This increased demand can be met by substituting ammonium nitrate explosive for nitroglycerine, nitrotoluene, and nitrophenol types of explosives. On the other hand, synthetic glycerine (1939 Year Book, page 142), toluene and phenol are now available in unlimited quantities from petroleum gases. Also lower nitroparaffins from petroleum gases may be converted into explosives.

Newspaper notoriety given L. Barlow for his oxygen-carbon bomb "glimite" was ignored by chemists, who recognized it as LOX, a liquid-oxygen explosive, 5,346,000 lb. of which were produced by the Germans in little portable air-liquefying machines during the last war. About as dangerous as dynamite, thousands of pounds are used in Midwest coal-mines.

**Miscellaneous** items include a cold-setting printers' ink which dries instantly; paints containing iodine or chlorine to kill germs and prevent mold; paint reflecting 72 per cent of ultra-violet light, chlorite for bleaching pine-pulp and fabrics; HTS, a salt bath for 290°-1000° F. containing nitrates and nitrites of sodium and potassium, and used commercially in the Houdrey petroleum catalytic process; discovery of Iceland-spar in New Mexico, from which 500 lb. of fine calcite crystals have already been removed; potassium cyanide by duPont, it having heretofore been imported; large-scale maleic anhydride production by Carbide and Carbon, commercial production of over 80 polyhydric alcohols and their esters; water-waxes, such as Carbowax by Carbide and Carbon; self-heating

canned goods which warm when a false bottom is punctured, admitting air to chemicals; and Benalite lignin containers by Masonite.

**Petroleum.** In 11 years the petroleum industry has expanded 539 per cent, rising from seventh to second place. Twenty-six billion gal. of gasoline were produced in 1940, and this could be pushed up to 40 billions on short order.

The modern 100-octane aviation fuel approaches Diesel engine efficiency, and in addition gives maneuverability and lifting power. It is thought that 125-octane is the ceiling of the present movement which will undoubtedly lead, in peacetime, to a redesigning of private automobiles to burn these superfuels. For good octane gas, the hydrocarbon must be as branched as possible, and present petroleum practice is to limit the gasoline to two or three hydrocarbons and thereby simplify control over the final product. This also facilitates adjustment of the motor to any given fuel.

The Polyform polymerization-cracking process of Gulf Oil was disclosed. New safety-fuels with flash points a hundred degrees above present aviation fuels have been developed to curtail fire hazards. Schweitzer of Penn State predicted the use of liquid oxygen for Diesel airplanes at the take-off where one-third more power is required than for continuous flight.

E. Berl described laboratory experiments for converting plant carbohydrates into coal and oil of high antiknock characteristics. The process involves heating the plants with limestone for an hour at slightly elevated pressure, and is claimed to be cheaper than high pressure hydrogenation of coal.

**Petroleum Gases.** Three hundred million gal. of liquefied petroleum gases, an increase of 32.5 per cent over 1939 included 19,000,000 gal. for small city gas plants, and 128,000,000 gal. for home use, the number of retail customers passing the million mark. Expansion is attributed to increased use in internal combustion engines such as for locomotives, electric generator and air-conditioning units, drilling and construction equipment, and in industrial plants where natural gas supply is diminishing. The future demands which the budding nitroparaffin and synthetic rubber industries will make upon these refinery gases can only be conjectured; but it is sure to be enormous.

**Phenol.** Phenol is an important intermediate for explosives (picrates) and plastics (Durez, Bakelite). In Germany, synthetic phenol has been manufactured by the Raschig Company on patents issued in 1930. In 1940 Durez Plastics and Chemicals, Inc., having acquired these patents, opened a \$2,000,000 plant with a capacity of 7500 tons annually, at North Towanda, N. Y. The process is so automatic that only six men and a supervisor are in attendance. Stage (1) is the catalytic chlorination of benzene at 230° C:  $C_6H_6 + HCl + \frac{1}{2}O_2 \rightarrow C_6H_5Cl + H_2O$ , for which the yield is 10 per cent, the unchanged benzene being recovered by condensation and scrubbing. Stage (2) also gives a 10 per cent yield at 425° C for the endothermic reaction  $C_6H_5Cl + H_2O \rightarrow C_6H_5OH + HCl$ . Phenol, residual products as a gaseous azeotropic mixture, and only 0.1 per cent waste products are obtained. After bubbling the gases through hot water, they may be re-circulated through the second stage; while the phenol is scrubbed out, and may be extracted from its water solution by a counter-current of benzene.

**Plastics.** The 1940 news included transparent

shoes and belts, vinyl acetate and polyamide photographic films, Vinyon hats which look like felt, transparent plastic packaging of syrupy foodstuffs, wood rendered flexible by soaking in urea; polyvinyl acetates by duPont for textile sizes and adhesives; Plastacele, a steel wire coated with colored cellulose acetate for binding books, melamine resins for molding and enamels; water-soluble plastics, including methyl cellulose and polyvinyl alcohols, for grease-proofing fabrics and making them flexible, and a group of new thermoplastic resins based on vinylidene chloride, trade name "Saran" by Dow (*Ind Eng Chem, News Ed* Vol 18, page 923, 1940), for fishing leaders, seat coverings, abrasive bonding, and so forth.

Four aircraft companies have produced experimental planes of molded and resin-bonded plywood types.

**Rubber.** Four centuries ago, the white man found the Indians of South America sporting with strangely resilient and elastic balls obtained from the gum of a tree. It was first known as "Indian Rubber" after the discovery by Priestley that it would rub out lead-pencil marks, for which purpose Britain imported it. Grenville Williams in 1860 showed that the destructive distillation of natural rubber yields a product named "isoprene," and in 1875 Bouchardat conceived the idea that this was a primary unit, which he succeeded in polymerizing back to natural rubber. As a result of the English blockade during the World War, Germany intensified her research on the problem, and by 1918 had produced 2350 tons of 2-3-dimethylbutadiene rubber from acetylene, precursor of modern German Buna rubber.

After the war, chemists realized that only by making a synthetic rubber better than the natural product could it compete economically. As a result, they disregarded the chemical composition of natural rubber, and turned to cheaper long-chain hydrocarbons as a basis for a natural rubber type. In 1926 Father Nieuwland interested E. K. Bolton of the duPont Company in researches conducted at Notre Dame on the production of vinylacetylenes, using ammonium and cuprous chlorides as catalysts. Feverish industrial research followed, and produced 2-chlorobutadiene, marketed at first as chloroprene, but subsequently trade-marked Neoprene. The steps were  $2 \text{ CH} \equiv \text{CH} \xrightarrow{\text{HCl}} \text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$  (acetylene)  $\rightarrow \text{CH} \equiv \text{C} - \text{CH} = \text{CH}_2 \xrightarrow{\text{HCl}} \text{CH}_2 = \text{CCl} - \text{CH} = \text{CH}_2$  (2-chlorobutadiene).

From the researches of 1934-40, four types of synthetic rubbers have emerged: (1) Di-olefins, which includes isoprene,  $\text{CH}_2 = \text{C}(\text{CH}_3) - \text{CH} = \text{CH}_2$ , or natural rubber, Buna or butadiene,  $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$ ; Methyl Rubber or dimethylbutadiene, and SKA or Russian rubber; (2) chloroprene which includes Neoprene and Sovprene; (3) di-olefins plus modifiers such as Buna S, which is Buna compounded with styrene  $\text{C}_6\text{H}_5 - \text{CH} = \text{CH}_2$  for rubber tires, Buna N compounded with acrylonitrile,  $\text{CH}_2 = \text{CH} - \text{C} \equiv \text{N}$ , Perbunan containing still more acrylonitrile for an oil resistant rubber; and (4) olefins plus di-olefins, such as Butyl Rubber.

Most of these have the compound *butadiene* as a base. Each country manufactures the butadiene from her most abundant resources: Russia via butyl alcohol from grain and potato fermentation, Germany and Italy via acetylene from limestone and coal, and the United States via butane from petroleum. The chemical steps for some of these processes have already been treated in detail (1937

YEAR BOOK, pages 136-7). In 1940 Standard Oil of New Jersey entered the Buna arena with the production of Butyl Rubber. In this process, secondary butyl alcohol is obtained from petroleum gas, butane. This is dehydrated over phosphoric acid at  $450^\circ \text{C}$ , yielding butylene. The butylene is brominated. Then two molecules of hydrogen bromide are removed, forming butadiene. The chemical formulas for these steps are  $\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$  (butane)  $\rightarrow \text{CH}_3 - \text{CHOH} - \text{CH}_2 - \text{CH}_3 \rightarrow \text{CH}_3 - \text{CH} = \text{CH} - \text{CH}_2 \rightarrow \text{CH}_2 = \text{CHBr} - \text{CHBr} - \text{CH}_2 \rightarrow \text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$  (butadiene).

The double bonds (=) in the formula for butadiene are the points at which the units will link with other units to form solid rubber. The processes of polymerization and vulcanization break and relieve the unsaturation of these double bonds, so that the finished product will have no tendency to react further. Since the amount of unsaturation in the synthetic product can be controlled, two types of rubbers may be produced: (1) those which are unsaturated like natural rubber and which can therefore be compounded and vulcanized with it in tire manufacture and (2) saturated synthetic rubbers such as chloroprene, sovprene, Buna N, and Perbunan. This second type, being saturated, is extremely resistant to sunlight, oxidation, and the action of oils; but it cannot be vulcanized and compounded with natural rubber.

Natural-rubber milling-equipment is used with synthetic rubbers. Chloroprene rubbers are easily handled, and just as zinc oxide, sulphur, and an accelerator are mixed with natural rubber, so zinc oxide, magnesia, and wood rosin are compounded with chloroprenes. Buna rubbers which are unsaturated are considerably more difficult to mill, and only a small bulk can be handled at one time, on the other hand they can be vulcanized into that portion of the tire which requires most resistance to deterioration, such as the side-walls.

Sodium (Na) was the original polymerization catalyst, hence the name Buna (*Butadiene + Na*). This has been replaced today by emulsion polymerization, with styrene or other co-polymer, forming a synthetic latex.

The commercial secrets of a half-decade of synthetic rubber research were suddenly released in 1940: Standard Oil using I.G. patents for Butyl Rubber, produced 5 tons per day by the end of 1940; Firestone Butyl Rubber tires were on exhibit at the New York World's Fair, Goodrich Ameripol rubber tires are available at the rate of 1000 a month, costing one-third more than natural rubber tires, and Goodyear Chemigum tires reached a production rate of 5500 tons annually. Dow has licensed the Universal Oil Products process for a \$300,000 butadiene plant near Harrisburg, Texas. About 11,000 tons of synthetic rubber were made in the United States in 1940; and a production of 20,000 tons by the fall of 1941 is anticipated. In 1939, 592,000 tons of natural rubber were used.

Other rubber products included Hewprene, a synthetic rubber hose; Ty-Ply, an adhesive for bonding synthetic rubber to metals; Ablo, a synthetic rubber putty. There are also rubber substitutes which do not lend themselves to vulcanization: Koroseal, a polymer of vinyl chloride; Thiokol, a condensation product of aliphatic chlorine compounds and sodium polysulphide; and Vistanex Polybutene, a blend of fully saturated Butyl Rubber and natural rubber.

**Textiles.** Nylon made an indelible impression in its first public appearance. Save for test sales in

Wilmington last year, nylon hosiery was offered for the first time on May 15, 1940. For five months the hosiery manufacturers had been building up stocks from such thread as the Seaford plant could supply. The stock was quickly exhausted. The Seaford plant doubled production in 1940; another plant at Martinsville, Va., will produce late in 1941, and the total capacity for nylon yarn will be 16,000,000 lb for 1942. Consumption was by no means confined to hosiery; other outlets were brushes, surgical sutures, fishing leaders, knitted fabrics and undergarments, velvet dresses, and tennis racquet strings. Additional posthumous patents were granted to Carothers for transparent nylon (polyamide) films for making paper flexible and fabrics waterproof, for motion-picture film much tougher than cellulose acetate and therefore more suitable for color photography, linings for containers, transparent window sheets, and artificial patent leather. DuPont also announced two wool-like fibers, one of rayon, Fiber D, which will be used for light-colored carpets, the other a polyamide said to have the crimp and heat-insulating properties of wool, also, a variety of methacrylate emulsion finishes for bodying fabrics. The name *prolon* has been suggested for casen wool.

**Toluene.** The lower-boiling hydrocarbons in petroleum are mostly straight-chains. Catalytic cyclization at 932° F and atmospheric pressure converts them into toluene, benzene, and the xylenes, basic materials for explosives such as TNT, picric acid, and trinitro-xylenes. First barrel of synthetic toluene from petroleum was taken off during the summer of 1940 by Shell from a 2,000,000 gal plant at Houston, Texas, using an extraction process. By catalytic cyclization Shell can boost this output five-fold, if necessary, furnishing 50,000 tons of TNT.

**X-Ray in Industry.** The X-ray machine has gone into business. Detroit Edison Company periodically examines poles for sound interiors. Citrus-fruit growers sort out frozen fruit, in one case \$250,000 worth of X-ray equipment saved \$7,500,000 worth of oranges. Peanuts, candy, chewing-gum, and tobacco are examined for pebbles and dirt. The Firestone Tire and Rubber Company Service Stations are installing machines to detect hidden nails, and fabric breaks, potential blow-out spots. X-rays make feet comfortable in 5000 shoe stores. Golf balls are X-rayed to check on the centering of the core. Airplane parts, steam tubing for submarines, 80 miles of welds in Boulder Dam all are scrutinized by this piercing ray. Cultured pearls are quickly spotted. In the museum old masterpieces are identified, and in one instance a 4000-year-old crime was exposed when it was discovered that some ancient undertaker had cleverly wrapped head, arms, and legs to resemble a perfect mummy.

**Awards and Medals.** The Royal Society conferred its Copley Medal on Prof. Paul Langevin, French physicist; its Davy Medal went to H. C. Urey of Columbia, discoverer of heavy hydrogen, and the Hughes Medal to A. H. Compton, authority on cosmic rays. Other awards were: Perkin Medal for 1941 to J. V. Door, Schoelkopf Medal to W. H. Bradshaw who developed Cordura rayon; T. W. Richards Medal to C. S. Hudson; Herty Medal to J. Sam Guy of Emory University.

One of the highest honors of the American Section of the Society of Chemical Industry, the Perkin Medal was awarded to C. M. Stine of duPont for his contribution to the growth of chemical industry in the United States. In his acceptance

speech Stine pointed out that, contrary to popular belief, American Chemical industry was large prior to the World War, but chiefly in the inorganic field. For example, the United States produced three times as much sulphuric acid as Germany in 1910, and twice as much alkalis as England. The organic field was sadly neglected in the United States until the start of the war. The gigantic industry which has since arisen represents enormous American investments and effort. Stine revealed that the duPont Company alone spent \$40,000,000 in research before a single cent of profit was realized.

The medal of the Canadian Section of the Society of Chemical Industry was presented to F. J. Hambly in recognition of his services to Canadian industries in the electric reduction of phosphates and the production of chemicals therefrom.

See AGRICULTURAL CHEMISTRY AND ENGINEERING, BUREAU OF; GLASS, HORTICULTURE, RUBBER, etc.

HUBERT N. ALYEA

**CHESS.** Mental colossi waged sedentary combat for hours on hours in 1940 and the world of chess was more or less enriched thereby. Dr. Max Euwe of Amsterdam, Holland, crossed intellectual swords with Paul Keres of Estonia and the latter was pronounced the victor by one slim point. Keres afterward engaged in the 12th tournament for the championship of the Soviet Union at Moscow, where he finished fourth. This important contest ended in a tie between Igor Bondarefsky of Rostov-on-Don and Andrea Lilienthal of Budapest, who acquired Russian citizenship in 1939.

An international master's tournament was played in Havana early in the year with Isaac I. Kashdan of New York carrying off the honors. His nearest rival was George Koltanowski of Belgium.

In the United States, the chief event of the year was the national championship tournament held (for the first time) under the auspices of the newly organized United States Chess Federation in New York. Samuel Reshevsky, for the third time in a row, was the victor. The "open" tournament of the federation, staged subsequently in Dallas, was won by Reuben Fine of New York, who was runner-up to Reshevsky in the New York tilt.

Chessy women continued to command their portion of attention. The national championship was captured by Mrs. Adele Rivero of New York, with Miss N. May Karff of Boston, the ex-champion, as runner-up. Miss Karff won the play-off that broke the triple tie among herself, Mrs. Mary Bain, and Dr. Helen Weissenstein for the American Chess Federation title.

Reuben Fine won the championship at the Marshall Chess Club and Arnold S. Denker, former State champion, was first at the Manhattan Chess Club contest. The New York State title devolved on Robert Willman. The Manhattan Chess Club was supreme in the Metropolitan Chess League.

Yale was victor in the annual tournament of the H.Y.P.D. College Chess League, and Brooklyn College won the Harold M. Phillips Trophy in the Intercollegiate Chess League.

**CHILD LABOR.** See CHILDREN'S BUREAU, LABOR CONDITIONS; LABOR LEGISLATION; NEW JERSEY under *History*.

**CHILD PSYCHOLOGY.** See PSYCHOLOGY.  
**CHILDREN'S BUREAU.** The Children's Bureau, U.S. Department of Labor, was established in 1912 to carry on research and provide informa-

tion and advisory service on child life in the United States. In 1935 it was authorized by the Social Security Act to administer three programs for grants to States for maternal and child-welfare services. In 1938 it was designated the Federal agency to administer the child-labor provisions of the Fair Labor Standards Act.

The White House Conference on Children in a Democracy, called by the Secretary of Labor at the direction of the President, at its meeting, Jan. 18-20, 1940, adopted a general report reviewing the record of progress in the United States in relation to children for the decade 1930-40 and outlined objectives to be sought during the decade ahead. The keynote of the report was "Our concern, every child." The recommendations dealt with the family as the threshold of democracy, the economic basis of family life, the family dwelling, religion in the lives of children, education, leisure-time services, protection against child labor, youth and their needs, child health, social services for children, including those in need of protection in migrant families and in minority groups, and public administration and financing of services for children. The Chief of the Children's Bureau served as the executive secretary of the conference, and the Children's Bureau is issuing the conference publications.

A National Citizens Committee, a Federal Interagency Committee, and national organizations are taking the lead in follow-up activities. State follow-up committees and local groups are considering action needed to bring their children's programs in line with the recommendations made. The National Citizens Committee in June, 1940, expressed its belief that child welfare and national security are inseparable and that the program recommended will make for national unity and will strengthen the democratic institutions of the country.

Pursuant to an order issued by the U. S. Departments of State and Justice permitting the entry of children to the United States for the duration of the war, the Children's Bureau issued standards for the reception, placement, and care of children brought over under the auspices of the U. S. Committee for the Care of European Children and similar organizations and established a register of children coming to the United States without both parents. Up to the first of January, 1941, approximately 850 children had entered the United States under the auspices of the committee, and approximately 4000 under other auspices. The British Cabinet decided in October to suspend temporarily the sending of children overseas.

The Council of National Defense in November, 1940, established the office of defense co-ordinator of health, welfare, and related activities affecting national defense, and designated the administrator of the Federal Security Agency as co-ordinator. The Children's Bureau is co-operating in the development of this program. See NATIONAL DEFENSE ADVISORY COMMISSION.

The research program of the Children's Bureau during 1940 included studies of the growth and development of newborn infants, incubators for premature infants, the effect of rickets on the pelvis of adolescent children; community studies of conditions affecting children; a demonstration project in the prevention of juvenile delinquency in St. Paul, Minn.; studies of State training schools for socially maladjusted children; and studies of the employment of minors in vegetable canneries, in

industrial home work, and in certain occupations particularly hazardous for the employment of minors. Current statistics are collected on health and welfare activities in urban areas, on delinquency cases handled by juvenile courts, and on the issuance of employment certificates. Information and advisory services are currently given on child growth and development, problems associated with illegitimacy, housekeeper and homemaker service for families, administrative problems of public and private child-placing and child-caring agencies, the prevention and treatment of juvenile delinquency, employment of children and minors, and legislation relating to these and similar subjects.

Research publications issued during 1940 included No. 250, *Children in the Courts*, 1937; No. 256, *Junior Placement*—a survey of junior-placement offices in public-employment centers and in public-school systems of the United States; No. 262, *Problems and Procedures in Adoption*; No. 263, *Methods of Assessing the Physical Fitness of Children*; and No. 264, *Directory of State, County, and Municipal Training Schools Caring for Delinquent Children in the United States*. The Children's Bureau issues a monthly news bulletin, *The Child*, that contains articles on current research and activities in the fields of child health and welfare.

More than 2,000,000 copies of the Children's Bureau publications on child care and training were distributed during the year ended June 30, 1940. More than 1,000,000 copies of *Infant Care* were distributed. A new series of folders on child growth and nutrition were issued in the fall of 1940.

Federal grants to the States for maternal and child-health services administered by the Children's Bureau were substantially increased in 1940 as a result of the Social Security Act Amendments of 1939 that raised to \$5,820,000 the sum authorized for annual appropriation for this purpose. The State health agencies used the increased funds, in large part to extend local maternal and child-health services, thereby increasing the number of centers where prenatal and child-health conferences are conducted by physicians and the number of home and office visits made by public-health nurses for maternal, infant, pre-school, and school hygiene, and increasing the medical and dental supervision of the health of school children. Two-thirds of the State health agencies now employ nutritionists to give consultation service on nutrition in relation to the maternal and child-health program. The program for postgraduate education of practicing physicians has been further developed through the employment of additional obstetric and pediatric consultants in State bureaus of maternal and child health and through resident courses at university medical centers. Ten States have undertaken local demonstration projects in complete maternity care, including prenatal care, medical and nursing care at delivery with hospitalization if necessary, and postpartum care for mothers in families that cannot provide such care. The Children's Bureau in 1940 issued two publications for use in the maternal and child-health program—*A Manual for Teaching Midwives* and *The Child-Health Conference; Suggestions for Organization and Procedure*.

The maternal mortality rate for 1939 was 40 deaths from puerperal causes per 10,000 live births, a decrease of 31 per cent from the rate in 1935 (58), the year in which Federal aid to the States

for maternal and child-health services was authorized. The infant mortality rate for 1939 was 48 deaths of infants under 1 year per 1000 live births, a decrease of 14 per cent from the 1935 rate (56). Special effort is being made in the State and local maternal and child-health programs to provide care for infants born prematurely and to prevent deaths during the first month of life.

The Children's Bureau Advisory Committee on Maternal and Child Health Services in December, 1940, recommended development of an adequate maternal and child-health program commensurate with existing needs for health services and medical care through substantially increased Federal grants to States.

Federal grants to the States for services for crippled children were also increased during 1940 to \$3,870,000 annually as a result of the Social Security Act Amendments of 1939. Although previously it was necessary for the State crippled children's agencies to match all the Federal grants accepted, the 1939 amendments made one million dollars available each year for grants to the States without a matching requirement. This fund, allotted on the basis of need, has permitted the expansion of the crippled children's programs in the States where financial resources are limited, and has enabled other States to expand their programs to take care of needs hitherto unmet.

The State crippled children's registers in September, 1940, showed 280,000 crippled children listed after examination by a physician. Each year crippled children are making approximately 190,000 visits to the State crippled children's clinics for diagnosis or treatment, about 29,000 crippled children are being given approximately 1,400,000 days of hospital care, and additional care in convalescent homes and foster homes is being provided. The State agencies increasingly are able to make provision for medical care for children who need to be hospitalized, and to provide medical, nursing, and social supervision and physical therapy for children who have returned home from the hospital.

To date, most of the children cared for under the State programs have been children suffering from orthopedic or plastic conditions. With the additional funds made available in 1940, 10 States have undertaken programs for children with heart disease, usually the result of rheumatic fever. Other States are preparing to start similar programs.

During 1940 the incidence of poliomyelitis was relatively high in the north-central and western States, although the total number of cases for the country as a whole was not abnormally high. Because Federal funds were available for grants without a matching requirement, the Children's Bureau was able to arrange promptly for additional grants to the States affected so as to enable the State crippled children's agencies to give immediate care when needed and, following the acute stage of the disease, to give the treatment that in many cases will prevent the crippling effects of the disease.

On June 30, 1940, the welfare agencies of the 48 States, the District of Columbia, Alaska, Hawaii, and Puerto Rico with Federal grants for child-welfare services administered by the Children's Bureau, were providing part of the cost of child-welfare services in 512 counties and 10 local areas composed of 69 towns. In six States workers on State staffs were giving some service to individual

children on a district basis. In addition, a large number of other areas were aided by State services through consultation and occasional case work. Reports from 46 States, Alaska, and Hawaii for October, 1940, showed that 42,500 children were receiving service from workers paid in whole or in part from Federal funds. Seventy-five per cent of these children were in their own homes or the homes of relatives and the others were receiving foster care or were under care elsewhere.

To the child-welfare worker are referred children who are homeless, dependent, neglected, and in danger of becoming delinquent. She studies with the family the child's need and draws upon the available community resources for meeting that need. Her reports to community agencies of facilities needed for children frequently result in joint effort to provide the necessary facilities. The work of the local child-welfare worker is strengthened by advisory and consultation service from the supervisory unit for child-welfare services in the State welfare department, which is also responsible for the development of local child-welfare services in additional areas and other functions relating to community child-welfare services.

The Children's Bureau Advisory Committee on Community Child Welfare Services in December, 1940, recommended additional Federal grants for this purpose in order to assure the continuation and progressive development of such services and urged the provision of child-welfare services sorely needed in many communities affected by the defense program.

Puerto Rico was made eligible for Federal grants under title V of the Social Security Act by the 1939 amendments. By July, 1940, grants to Puerto Rico were being made under all three programs administered by the Children's Bureau.

During 1940 the Children's Bureau made progress in the enforcement of the child-labor provisions of the Fair Labor Standards Act of 1938 that, in effect, prohibit the employment of minors under 16 years of age in establishments producing goods for shipment in interstate commerce and the employment of minors under 18 in such establishments at occupations found and declared hazardous by the Chief of the Children's Bureau. At the close of the year the Children's Bureau had designated 42 States and the District of Columbia, Hawaii, and Puerto Rico in which the State employment certificate in the hands of the employer is recognized as satisfactory proof of age under the Fair Labor Standards Act. In 4 States the Children's Bureau was issuing Federal certificates of age with the co-operation of State and local officials, and the other two States and Alaska were still operating under the regulation providing that employers may protect themselves from unintentional violation by obtaining birth certificates or baptismal certificates for their minor employees. Investigations were made of 2264 establishments by representatives of the Children's Bureau in the year ending June 30, 1940. Working arrangements with the Wage and Hour Division (q v) and the Division of Public Contracts of the Department of Labor extended the effectiveness of the inspection program. Connecticut, Minnesota, North Carolina, and the District of Columbia are co-operating with the Wage and Hour Division and the Children's Bureau in making inspections under the Fair Labor Standards Act with reimbursement for such service. A total of 1049 children under 16 years of age were found employed in violation of the child-

labor provisions of the Federal act during the fiscal year 1940. Forty minors under 18 years of age, including seven of those under 16, were found employed in violation of hazardous-occupations orders. In two criminal cases during the year ended June 30, 1940—one against a manufacturer of lottery tickets and the other against a manufacturer of artificial flowers—oppressive child labor in industrial home work was found to exist in violation of the Federal act. Fourteen civil cases which were closed by consent decrees enjoining against future violations involved seven canneries, one boot and shoe factory, one manufacturer of crates, cups, and boxes, and industrial home work in connection with five establishments manufacturing hairpins, shade pulls, or paper cups.

Three orders under the Fair Labor Standards Act have been issued by the Chief of the Children's Bureau declaring occupations in certain industries hazardous for minors 16 and 17 years of age, thereby making illegal such employment in establishments producing goods for shipment in interstate commerce. The first, effective July 1, 1939, declared hazardous for minors 16 and 17 years of age all occupations in establishments manufacturing explosives or articles containing explosive components, the second, effective Jan 1, 1940, declared hazardous, for such minors the occupations of motor-vehicle driver and helper in establishments subject to the act, the third, effective Sept 1, 1940, declared hazardous for workers under 18 all occupations in or about coal mines except certain specified surface occupations. Investigation is under way of the hazards for minors in the sawmill industry, on woodworking machines, and in the shipbuilding industry. See JUVENILE DELINQUENCY. For aid to dependent children, see table under RELIEF.

See BENEFACCTIONS

**CHILD WELFARE.** See BENEFACCTIONS; CHILDREN'S BUREAU, SOCIAL SECURITY BOARD

**CHILE.** A South American republic Capital, Santiago

**Area and Population.** Area, 286,396 square miles, population, 5,000,782 at 1940 census (4,287,445 in 1930). Of 105,463 aliens residing in Chile in 1930, 23,439 were Spaniards, 11,070 Italians, and 10,861 Germans. United States citizens numbered 1215 on Jan. 1, 1940. Chileans are predominantly of European (chiefly Spanish) origin but there is a considerable Indian strain in the lower classes. Estimated populations of the chief cities in 1939 were Santiago, 829,830, Valparaíso, 263,228; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488, Iquique, 46,458; Talca, 45,020, Chillán, 39,511.

**Defense.** Under the compulsory military service system, all youths of 20 are called to the colors, mostly for a year and a half, and then serve in the reserve until 45. As of Nov 1, 1939, the active army numbered 40,915 and trained reserves 212,000; active air force, 2962 men, with over 200 airplanes. The navy comprises 1 battleship, 3 cruisers, 8 large destroyers, 9 submarines, and various auxiliary vessels, manned by about 8000 men in all.

**Education and Religion.** Elementary education is compulsory, but about 25 per cent of all adults remain illiterate. In 1940 there were estimated to be 900,000 children of school age, of whom 583,664 were enrolled in public schools and

90,595 in 834 private schools. Of the private schools, 657 received state aid. The five universities had 6195 students in 1938. Roman Catholicism is professed by the great majority of Chileans, but the Church was disestablished in 1925.

**Production.** At the 1930 census, 37.8 per cent of the working population was engaged in agriculture and 22.1 per cent in industry and mining. Yields of the chief crops in 1938-39 were (in metric tons): Wheat, 967,100; barley, 109,000; oats, 152,700; corn, 63,450; beans, 71,340; lentils, 19,130; peas, 20,000; potatoes, 486,600, chickpeas, 5000. Grapes and other fruit are extensively cultivated. In 1938 there were 2,634,499 cattle, 5,749,069 sheep, 527,827 horses, 571,495 swine, and 93,525 mules and asses. Wool exports (1939), were 36,579,400 lb. Mineral output in 1939 was (in metric tons): Copper, 339,173; nitrate, 1,445,999; iron ore, 1,625,622; coal, 1,882,206; gold, 22,242 lb.; silver, 73,034 lb. The average number of workers employed in mining in 1939 was 61,560. Industrial output in 1939 included Cement, 8,018,000 bags (of 93.5 lb.), coke, 85,032,000 kilos (of 2.2 lb.); knitting wool, 354,000 kilos, cloth, 3,243,000 meters, refined sugar, 120,921,000 kilos; beer, 68,272,000 liters. Paper, tobacco, shoes, glass, etc., are manufactured. Wages paid to industrial workmen in 1939 totaled 2,018,900,000 pesos.

**Foreign Trade.** Imports in 1939 were valued at 410,833,000 gold pesos (\$84,673,000) and exports at 671,365,000 gold pesos (\$138,368,000). As compared with 1938, imports declined by 17.7 per cent and exports by 17 per cent. Leading 1939 exports were (in gold pesos): Copper bars, 331,640,000; nitrate, 127,426,000; gold and silver ores, 35,612,000; wool, 27,740,000. The United States supplied 31.1 per cent of the 1939 imports; Germany, 22.7; Great Britain, 8.3. Of the exports (excluding nitrate), the United States took 30.5 per cent, Great Britain, 12.3; Germany, 8.4. See TRADE, FOREIGN.

**Finance.** Ordinary budget estimates for 1940: Revenues, 1,771,433,000 paper pesos, expenditures, 1,771,373,000. Actual returns for 1939 (ordinary budget): Revenues, 1,792,524,000 paper pesos, expenditures, 1,777,383,000. The 1939 receipts included a surplus of 14,940,000 pesos carried over from 1938. For special budget, see HISTORY. Long-term foreign debt on Dec 31, 1939: \$176,424,000 (U.S. currency), £27,763,571, and 108,994,000 Swiss francs. Unfunded foreign debt (Dec. 31, 1938), \$26,593,082 and £3,434,350, total internal debt, 1,851,732,768 paper pesos.

The gold peso, used only for foreign trade statistics, was equivalent to \$0.2060. Average exchange rates of the paper peso for 1939: Official, \$0.052 (\$0.052 in 1938), curb, \$0.0308 (\$0.0363 in 1938); free, \$0.0322.

**Transportation, etc.** Chile in 1940 had about 5450 miles of railway line (1815 miles privately owned), 22,613 miles of highways (see ROADS AND STREETS), and domestic and foreign air services linking all the chief cities with the inter-American and European air networks. The State railways showed an operating loss of 4,142,172 pesos for 1939 (ordinary budget for 1940, 482,000,000 pesos). Reconditioning of the Transandine tunnel to permit both railway and automobile traffic to and from Argentina was announced in February. The Deutsche Luft Hansa line between Santiago and Rio de Janeiro was reopened Mar. 18, 1940, after a six-months' interruption. Chilean national airlines in 1939 carried 3174 passengers, 14,483 kilos of freight, and 8310 kilos of mail.

The Chilean merchant marine comprised 106 ships of 176,289 tons on June 30, 1939.

**Government.** The Constitution of Oct. 18, 1925, vested executive powers in a President, elected by popular vote for six years and ineligible to succeed himself, and legislative powers in a popularly elected Congress consisting of a Senate of 45 members serving for eight years and a Chamber of Deputies of 146 members serving four years. Pedro Aguirre Cerda (Radical) was elected President by a Popular Front coalition on Oct. 25, 1938, and assumed office Dec. 24, 1938. His cabinet as reorganized Dec. 26, 1939, represented a coalition of the Radical, Socialist, and Democratic parties.

#### HISTORY

President Aguirre Cerda's Popular Front government continued throughout 1940 on the stormy course that had marked its first year in office (see YEAR BOOK, 1939, p. 135 f.). Seething political passions repeatedly threatened to erupt into civil war. The spread of the European conflict eliminated additional Chilean export markets and added to the difficulties of the government's economic and financial problems. While the country was still struggling to recover from the destructive earthquake of 1939, two great storms inflicted heavy damage in north and central Chile. Nevertheless the government proceeded with its program of economic and social rehabilitation and won increased political support.

**Political Trends.** The Popular Front coalition of Radicals, Socialists, Communists, Radical Socialists, and Democrats held together during 1940 only because of the constant threat of a rightist coup. Deep cleavages developed within the two largest parties supporting the government—the Radicals and Socialists. Strong elements in both parties displayed increasing reluctance to continue their co-operation with the Communists, and made repeated moves to form a new coalition excluding the Communists and including middle-of-the-road elements within the opposing right wing coalition. These dissensions within the Popular Front were reflected in successive reshufflings of the cabinet and frequent changes in party executive committees.

Lacking majorities in both houses of Congress, the government was obliged to make deals with small groups within the opposition coalition to obtain the enactment of legislation. The secession from the government ranks of the extremist Chilean Nazi party, which had been reorganized as the Popular Socialist Vanguard, added to the general political tension. Its affiliation with the conservative opposition bloc had precisely the same effect as the presence of the Communists in the Popular Front. Co-operation by elements within the bloc was made more difficult while the opposing coalition was forced into closer unity by the threat of violence implicit in the Popular Socialist Vanguard's program. At the same time the political situation was further complicated by the increasingly bold propaganda and activities of the German Nazi groups in Chile following the German military successes in Europe.

In this delicate situation, President Aguirre Cerda followed a middle-of-the-road policy that antagonized extremists in both camps. His political appointments and his outlawing of a long strike of Santiago newspaper workers, directed at both rightist and leftist publications, provoked at-

tacks from Communists and extreme Socialists. The rightist groups violently criticized him for invoking the internal security law against opposition conspiracies and refusing to permit the return to Chile of Gustavo Ross, unsuccessful rightist Presidential candidate in the 1938 elections. Despite their deep differences, the Popular Front parties rallied to the support of the President whenever he became involved in controversy with the opposition.

Tension between right and left again neared the breaking point when President Aguirre Cerda on July 11 pardoned police officers serving prison sentences for their part in the "massacre" of 58 youths participating in the Nazi revolt of September, 1938. This provoked new and more virulent attacks by the Popular Socialist Vanguard, the Fascist Nationalist party and other rightist elements. The police then raided the headquarters of these two parties and arrested many of their leaders, announcing that they had nipped a reactionary revolt plot in the bud. (Later 20 leaders of the Nationalist party were convicted and sentenced to prison for subversive activity.) The government also ordered the suspension of two violently anti-administration newspapers in Santiago.

Immediately afterward (July 16) the Franco Government in Spain severed diplomatic relations with Chile, adding to the tension. There appeared imminent danger that the well-organized and armed Nazi movement among Chileans of German descent would seize the opportunity presented by internal disorders to install a pro-German, totalitarian regime at Santiago. To forestall this danger, moderate leaders in the Popular Front and opposition blocs made successive efforts to negotiate a political truce. This caused further dissension within the Popular Front, leading to another severe cabinet crisis at the end of July.

The effort to find a basis of co-operation between the government parties and the opposition broke down in September when the President rejected a 10-point program drawn up by the rightist leaders. It called for the outlawing of the Communist party, a general amnesty, the return of Gustavo Ross, strict application of the Labor Code, etc. The opposition Conservative and Liberal parties then joined forces with the Popular Socialist Vanguard in an anti-Communist crusade. On October 18 they held a great mass meeting in the capital in protest against Communist activities, while a larger Popular Front demonstration against "Nazism and rightist reaction" was held a short distance away. Four days later the Conservative President of the Senate called Congress into special session, over the opposition of President Aguirre Cerda, to consider a bill outlawing the Communist party.

After a series of victories in by-elections early in the year, the Popular Front captured the Senatorial seat for Valparaíso and Aconcagua provinces on November 17 for the first time in history. The following day the rightists introduced their anti-Communist bill in the Chamber of Deputies and on November 19 they decided to boycott the Congressional elections scheduled for March, 1941. The rightist majority in the Chamber, charging the Minister of the Interior with failing to preserve order during the November 17 election, voted on November 30 to suspend him from office. Popular Front leaders blamed the election disorders (1 man was killed and 60 injured) on

rightist gunmen and charged the opposition with fostering a revolutionary movement.

The bill declaring Communists and all Communist activities illegal was passed by the Chamber of Deputies, 72 to 42, on November 30. Believing that the Communists constituted a liability in the impending showdown with the rightists, some Popular Front leaders endorsed the anti-Communist bill and urged expulsion of the Communists from the government bloc. The Socialist party's central committee made a recommendation to this effect, following an open break between the Communists and the Socialist Minister of Development, Oscar Schnake. The executive committee of the Popular Front on December 21 refused to oust the Communists but negotiations for a coalition of non-Communist leftist parties continued.

**The Nazi Threat.** Activities of the Chilean branch of the German Nazi party and their native allies aroused much criticism and alarm during the year. Pro-democratic Chileans in June organized the League of Defense to investigate and expose the Nazi program and to take other measures for the defense of democracy. This movement enrolled thousands of adherents among Chilean youths of all classes. It began publication of an anti-Nazi newspaper and sent agents all over Chile to recruit members and assist authorities in dealing with the Nazi threat.

The government took no effective measures against the Nazis and pursued a policy of cautious neutrality toward the European War. However a United States military aviation mission was contracted for on April 23 and late in the year Congress authorized the expenditure of 1,000,000,000 pesos for defense.

For a full description of German Nazi activities in Chile, see the series of articles by Russell B. Porter in the *New York Times* of July 13-18, 1940, inclusive.

**Economic Situation.** Economic conditions in Chile became increasingly unfavorable as a result of the slackening in the export demand for agricultural and mineral products, a tightening of previous exchange difficulties, and a decline in governmental revenues that forced the government to curtail its expenditures.

To make matters worse, a storm severely damaged the port of Valparaiso on May 22, wrecking a floating dock that was indispensable to Chilean shipping, and inflicting total damages estimated at 75,000,000 to 100,000,000 pesos. This was followed on July 25-26 by a 48-hour cloudburst that hit the normally rainless northern provinces with devastating effect. A large number of people were reported drowned, killed, or injured by floods and gales. The nitrate mines suffered heavy financial losses and there was much damage to Antofagasta, Iquique, and other cities, as well as to railways, roads, and communications. Rain in this region is a phenomenon that occurs only two or three times in a century.

**Legislation and Measures.** In the face of political and economic setbacks, the government concentrated its major efforts upon carrying out the program of earthquake rehabilitation and economic development adopted during 1939 (see *YEAR BOOK*, 1939, p. 136). For financing this five-year plan during 1939, the government obtained 486,900,000 pesos as follows: Taxes, 160,000,000; bank loan and advances, 293,000,000; contributions, 30,000,000; exchange profits, 3,900,000. Of this sum,

108,900,000 pesos were spent during 1939 by the Corporation for Development of Production and 254,300,000 pesos by the Reconstruction Corporation, leaving a balance of 123,700,000 pesos on Jan. 1, 1940. Total expenditures of both corporations for 1940 were estimated at about 424,000,000 pesos, of which 180,000,000 was to come from taxes and 120,000,000 from domestic bank loans and advances.

The Reconstruction Corporation announced May 18 that of the 840,000,000 pesos to be expended by it during the remaining four years of the plan, about 400,000 pesos would go to public works, 300,000,000 to loans to private individuals for reconstruction of homes and industries, and 140,000,000 for direct assistance to city governments, insurance institutes, fire departments, etc., in the earthquake-ravaged districts.

The Development Corporation, after long negotiation, obtained a \$12,000,000 credit from the Export-Import Bank of Washington in May for the purchase of hydro-electric and other machinery in the United States. An additional \$5,000,000 credit was advanced by private American manufacturing interests. A program for the intensification of Chilean production through investment of these and other funds was approved by President Aguirre Cerda on July 22. During July authorizations were granted for the establishment of factories to produce cloth, furniture, foodstuffs, knit goods, and clothing, and a contract was concluded with an American company for the formation of a corporation to manufacture tires in Chile. Steps were taken to attract additional private investors and enterprises from the United States. The government also made vigorous efforts to find American and Far Eastern markets for Chilean goods that formerly went to Europe. The provisional commercial agreement concluded with the United States early in 1938 was put into effect as of Jan. 5, 1940.

The danger that the government's whole economic program would be nullified by labor difficulties and drastic price rises led the President on July 10 to warn that the government "would not tolerate either strikes or lockouts that interfere with production." The Minister of Interior on December 24 ruled that all strikes not settled within 10 days must be submitted to arbitration. He barred farm strikes until after the next harvest. Due to the growing exchange shortage, amortization payments on the foreign debt were temporarily suspended on December 4.

**Foreign Relations.** The Franco Government in Spain abruptly severed diplomatic relations with Chile on July 16, citing alleged insulting remarks concerning General Franco and Nationalist Spain made during a Popular Front demonstration in Santiago on June 17. The old issue of Chile's refusal to surrender Spanish Loyalists who had taken refuge in the Chilean Legation in Madrid was a factor in the situation (see *YEAR BOOK*, 1939, p. 137). The Chilean Government again received general support from the other American republics. The Franco Government finally agreed to permit the last Republican refugees in the Chilean Legation to leave Spain and on October 12 diplomatic relations were renewed.

Efforts to revive the Argentine-Chilean controversy over islands in the Beagle Channel (see *YEAR BOOK*, 1938, p. 57) were made in some Argentine and Chilean newspapers. This was denounced by Chilean government spokesmen as a Nazi-inspired move to create dissension among the American republics. The two governments decided

to select a new United States arbiter to determine ownership of the islands, in place of former Atty. Gen. Homer S. Cummings. Another dispute arose when Chile on November 6 laid claim to all of the Antarctic territories between 53 and 90 degrees West Longitude, some of which were claimed by Argentina. It was announced December 20 that an Argentine technical commission would go to Santiago early in 1941 to delimit Argentine-Chilean frontiers in the Antarctic.

The Popular Front Government and its adherents gave a warm welcome to a Mexican goodwill mission of more than 300 members which spent nearly a month in Chile during March and April. The visit was interpreted as a move by the Cardenas Government to secure Chilean support of Mexico in her oil and other controversies with the United States.

The Communists, opposing co-operation with the United States in the Pan American policy of hemisphere defense and solidarity, continued their attack upon "Yankee imperialism" along much the same lines as the German-inspired propaganda of the Chilean Nazis and some of their rightist allies. However the Aguirre Cerda Government adopted an increasingly cordial attitude toward the United States, particularly after the Export-Import Bank loan was obtained. In July the U.S. cruiser *Phoenix* made a "good-will" visit to Valparaíso following revelation of the Nazi conspiracy in Uruguay (q.v.) and reports of a similar danger in Chile. The Chilean press almost unanimously praised the role of the United States at the Havana Conference in July. Government organs subsequently supported Washington's proffer of financial and technical aid in establishing naval and air bases in Latin American countries for the joint use of the Pan American republics in repelling overseas aggression. However all sections of Chilean opinion insisted that if such bases were established in Chile they must remain under her sovereignty and control.

See ARGENTINA, MEXICO, and URUGUAY under *History*; *Communism*; *Fascism*; *Industrial Chemistry*; *League of Nations*; *Naval Progress*; *Pan Americanism*; *Pan American Union*; *Tunnels*.

**CHINA.** A republic of eastern Asia. Provisional capital, Chungking. Nanking, the former capital, was captured by the Japanese in December, 1937, and Hankow, to which most of the Chinese Ministries were then transferred, fell in October, 1938.

**Area and Population.** Including the nominal dependencies of Sinkiang (Chinese Turkestan), Outer Mongolia (see MONGOLIA), and Tibet (q.v.), over which the Central Government exercised little or no actual control, and the former Chinese Provinces incorporated in the Japanese protectorate of Manchoukuo (q.v.), China has an area estimated by the Ministry of the Interior in 1937 at 4,516,934 square miles and a total population of 466,785,856. Official 1937 estimates of the area and population by Provinces are shown in the accompanying table.

As no census has been taken in modern times, the above figures are merely rough estimates. Including the nominal dependencies, the area is roughly equal to that of the United States and Mexico combined, while the population is approximately one-fourth of the world's total. In addition there were estimated to be 7,828,888 Chinese residing abroad in 1936. The Japanese civilian pop-

ulation of China on Jan. 1, 1940, was 345,700, an increase of 300 per cent since July, 1937. The estimated population of Shanghai and its environs in 1936 was 3,489,998 including 1,450,685 persons in the Foreign Settlements; of Peiping, capital of China until 1928, 1,556,364; of Tientsin, 1,292,025; of Nanking, 1,019,948; of Tsingtao, 514,769. Estimated populations of the other chief cities in 1931 were: Canton, 861,024; Hankow (including Wuchang and Hanyang), 777,993; Chungking, 635,000; Wenchow, 631,276; Changsha, 606,972; Ganschow, 606,930; Weihaiwei, 390,337; Foochow, 322,725; Soochow, 260,000; Amoy, 234,159; Ningpo, 218,774; Wanhhsien, 201,937; Chinkiang, 199,776.

\* Where more than one name is given for the respective capitals in parentheses, they represent the official name, postal map name, and popular or ancient name, in the order given. \* Chahar, Ningsia, and Suiyuan Provinces, together with part of Jehol, form the geographical region known as Inner Mongolia. \* The Provinces of Heilungkiang, Kirin, and Liaoning constitute the geographical region known as Manchuria, which on Feb. 18, 1932, was proclaimed the free State of Manchoukuo. Jehol Province was incorporated in Manchoukuo in 1933. \* Dependencies. \* The Mongol name for Urga has been changed to Ulan Bator Khoto.

**Education and Religion.** Between 25 and 50 per cent of the population were estimated to be literate in 1937, compared with an estimated 15 per cent in 1912. In 1935 there were 16,000,000 children in primary schools, of whom 12,383,479 were in 259,095 regular schools and the rest in one-year primary schools. For secondary education, there were in 1934-35, 3140 schools of all kinds, with 541,479 students. There were 107 institutions of higher learning in 1937 and 41,768 students attending them in 1935 (6200 women). Between the outbreak of war in 1937 and October, 1939, 17 universities and colleges moved from Japanese-occupied areas to Yunnan, Kweichow, and Kwangsi provinces, 17 to Hunan and Szechwan, and 5 to Shensi and Kansu. Several new technical and normal colleges were founded during this period by the Chungking Government. In 1938, 9081 men and 2038 women passed examinations qualifying them to enter institutions of higher education under the jurisdiction of Chungking.

With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at about 20,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. The Protestant churches, with 1130 mission stations and 488,539 communicants in 1932, had 19 colleges, 267 middle schools, and 37,714 students in 1934.

**Production.** Previous to the outbreak of the Chino-Japanese War in 1937, China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet potatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton, and was an important producer of corn, tobacco, fruits and vegetables, and cane sugar, as well as the leading exporter of eggs and tung oil. Estimated production of rough rice in 1940-41 was 2,440,000,000 bu.; winter wheat in 1940, 700,000,000 bu.; cotton in 1940, 2,000,000 bales of 500 lb. (compared with an average of 3,000,000 bales); flue-cured tobacco in 1940, 140,000,000 lb. (average production, 155,000,000 lb.). Production of other crops, in metric tons, was: Barley, 6,371,000 in 1937; oats, 852,500 in 1937; corn, 6,130,100 in 1936; rape-seed, 1,987,300 in 1937; sesamum, 865,000 in 1936; peanuts, 2,631,100 in 1936; soybeans, 5,911,000 in 1936. Exports of raw silk, excluding Manchuria, were 4777 metric tons in 1939. Tea production is estimated at from 300,000 to 500,000 metric tons annually. Production of wool and mohair for China and Manchuria was about 55,000 metric tons in 1938.

China is normally one of the world's principal producers of antimony, tin, tungsten, and manganese. It produces substantial quantities of coal, oil, fluorite, mercury, galena, gold, silver, and many other metals. Tungsten exports in 1939 were 10,689 metric tons; manganese (1938), 600 metric tons; iron ore (excluding Manchuria), 40,000 metric tons in 1939; tin (smelter), 10,600 metric tons in 1939. Antimony production was estimated at 8100 metric tons in 1938. China's rapidly expanding industries (see *YEAR BOOK*, 1937, p. 152) suffered a severe setback as a result of the war, but a marked development of manufacturing in the western provinces ensued. New iron and steel plants were established in Szechwan and Yunnan provinces. Copper deposits in Szechwan, Sikang, and the southwestern provinces were opened and several electric copper refineries constructed. Among the 418 factories moved to the western provinces from Japanese-occupied territory during the first two years of the war were 168 for the manufacture of war equipment and supplies. Also see *History*.

**Foreign Trade.** Merchandise imports in 1939 were 1,333,653,896 yuan (Chinese standard dollars); exports, 1,027,246,508 yuan. The chief sources of imports were: Japan, 313,398,000 yuan; United States, 214,100,000 yuan; India, 119,439,000 yuan; Germany, 87,167,000 yuan; Great Britain, 77,860,000 yuan. Of the exports, the United States took 225,873,000 yuan; Hong Kong, 222,099,000 yuan; Great Britain, 90,863,000 yuan; Japan, 66,621,000 yuan. Animal products, raw silk, metals and minerals, piece goods, and oils, tallow and wax were the chief exports, in order of value. The main imports were raw cotton, chemicals, metals and ores, dyes and paints. See *TRADE, FOREIGN*.

**Finance.** The budget announced by the Nationalist Government at Chungking for the calendar

year 1939 was 2,850,000,000 yuan, or three times the size of the prewar 1936 budget. Expenditures during 1940 were estimated at about 3,500,000,000 yuan. Actual revenues in 1939 were variously estimated at from 200,000,000 to 1,200,000,000 yuan. The balance between actual receipts and expenditures was made up by loans and inflation of the currency.

Loans floated by the Chinese Nationalist Government from July 1, 1937, to June 30, 1940, totaled 3,430,000,000 yuan, 100,000,000 customs gold units, 100,000,000 U.S. dollars, and £20,000,000 sterling, according to the Central Bank of China. The Ministry of Finance estimated the Chungking Government's indebtedness on June 30, 1939, at 8,100,000,000 yuan (domestic, 5,600,000,000; foreign, 2,500,000,000).

As of June 30, 1940, note issues of the four Chinese Government banks were estimated at about 4,000,000,000 yuan, representing an expansion of 150,000,000 yuan monthly during the first half of 1940. Estimated issues of provincial and private banks and military scrip of the Eighth Route Army were placed at 500,000,000 yuan.

Revenues of the Japanese-sponsored Nanking regime were estimated at about 250,000,000 yuan for the first half of 1940. Currencies issued under Japanese sponsorship up to June 30, 1940, were estimated to total more than 1,200,000,000 yuan. The total note circulation in China, including both Chinese and Japanese issues, was about 5,700,000,000 yuan, or three times as much as before the outbreak of hostilities. Inflationary commodity prices prevailed in all areas. The average nominal exchange rate of the Chinese yuan in Shanghai was \$0.2136 in 1938, \$0.1188 in 1939, and \$0.0569 in December, 1940.

**Transportation.** As of Aug. 1, 1939, 4546 miles of China's railways were reported to be in Japanese-occupied territory and about 2285 miles in Chinese-held territory. Operations on many of these lines were suspended or restricted to military traffic. The Japanese-controlled North China Railways, aggregating 3429 miles of line, reported a freight traffic of 30,525,084 tons for the year ended Mar. 31, 1940, or a 50 per cent increase over 1938-39. The Yunnan-Indo-China Railway was forced to suspend shipments of supplies to the Chungking Government (see *History*) but a new railway connecting Yunnan with Burma was under construction. Several new railway lines were opened in the Japanese-occupied section.

Highway mileage in all China was estimated at 61,430 in 1939. In western and southwestern China, the Chungking Government constructed about 3500 miles of new roads and improved 10,000 miles of existing roads between 1937 and 1939, bringing the length of highways in Chinese-controlled territory to 52,000 miles. Highways in North China and Inner Mongolia open to motor traffic were estimated at about 12,000 miles in 1940. Air services were operated over 6000 miles of routes late in November, 1939; 3300 miles had been opened since July, 1937. In September, 1940, commercial air lines connected Chungking with Hong Kong, Kunming, Hanoi, Burma, Chengtu, Sianfu, Lanchow, and Moscow. In Japanese-occupied territory, all air lines were in Japanese hands.

During the first six months of 1940, the total tonnage entering the port of Shanghai from abroad was about 20 per cent less than for the first half of 1937. The Yangtze River remained closed to other than Japanese shipping.

**Government.** The Nationalist Government at the beginning of 1940 represented a Kuomintang (Nationalist party) dictatorship. The Organic Law of Oct. 4, 1928, revised on Dec. 29, 1931, and Dec. 27, 1932, vested supreme power in the National Congress of the Kuomintang, acting through the Central Executive Committee, the Central Supervisory Committee, and the Central Political Council. Executive control, however, rested mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nationalist armies. Pending the establishment of representative government, governmental functions were carried on by means of a committee system (for description, see 1932 YEAR BOOK). The chairman of the State Council and nominal head of the government was Lin Sen. The chairmen of the five yuan (committees) of the government were: Executive, Gen. Chiang Kai-shek, assisted by Dr. H. H. Kung as vice-chairman; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-tao; Control, Yu Yu-jen. Under the chairman of the Executive Yuan are nine ministries, headed as follows in 1940: Interior, Chow Chung-yueh; Foreign Affairs, Dr. Wang Chung-hui; Military Affairs, Gen. Ho Ying-chin; Finance, Dr. H. H. Kung; National Economy, Dr. Wang Wen-hao; Communications, Chang Chia-ngau; Education, Chen Li-fu. Attached to the Executive Yuan are three subordinate Commissions, supervising Mongolian and Tibetan Affairs, Overseas Chinese Affairs, and Famine Relief. Also see HISTORY.

#### HISTORY

Another year of sanguinary fighting on many fronts failed to break the military stalemate in the Chino-Japanese War that developed toward the end of 1939 (see YEAR BOOK, 1939). By the end of 1940 the conflict had lasted three and one-half years, but prospects of a Japanese victory appeared more remote than ever. Repeated Japanese military offensives and continuous destructive air raids on Chinese-held cities during the year failed to extend the Japanese territorial conquests perceptibly or to weaken the morale of Gen. Chiang Kai-shek's forces operating from Chungking.

The Japanese made correspondingly little progress in organizing the economic exploitation of the conquered Chinese provinces. The collapse of France in June enabled Japan to improve its strategic and diplomatic position against China, largely through concessions extracted by threat and force from France and Britain. But the United States and the Soviet Union continued to give the Chungking Government moral and material support.

**Military Campaigns.** Japan's first major military reverse of 1940 was in the drive launched in December, 1939, from Canton northward along the railway line to Hankow. After advancing about 100 miles from Canton into northeastern Kwangtung Province, the Japanese columns were halted early in January and by the middle of the month were driven back to the environs of Canton in a disastrous retreat.

Toward the end of January the Japanese forces that had captured Nanning in Kwangsi Province the preceding November, started a series of drives to widen the area under their control. They captured Pinyang, 40 miles north of Nanning, and pushed on 30 miles more before vigorous Chinese counterattacks drove them back to Nanning in mid-February in some disorder. Casualties were

heavy on both sides. A simultaneous Japanese drive in Inner Mongolia met a similar fate. Starting from Paotow, western terminus of the Peiping-Suiyuan railway, a mechanized column of 30,000 men struck westward in an effort to cut the Lanchow-Urunchi motor and caravan route over which Soviet supplies were reaching the Chinese. After capturing Wuyuan and Linho, more than 150 miles distant, the Japanese column was forced by a Chinese flank attack to retreat hurriedly to Paotow.

Faring no better in smaller-scale fighting on other fronts, the Japanese army command in South China on February 14 announced in a manifesto addressed to Chiang Kai-shek that "in the future we will not expand our operations but will await your offensive." The manifesto explained that the Japanese had won "sufficient areas in China for the establishment of the new order in Asia," cut the supply routes to Chungking, and was making rapid progress in forming a new central government in China under Wang Ching-wei. However the Chinese opened new highway routes into French Indo-China further inland to replace that severed by the fall of Nanning. Traffic on the Yunnan railway, interrupted by Japanese bombing early in January, was soon resumed on a reduced schedule.

**Shansi Offensive.** With the Japanese remaining inactive in the south, the fighting shifted to the central and northern fronts. In April the Japanese began their 11th effort to sweep the Chinese out of the Chungtiao Mountains and the Ching Valley in southern Shansi Province and secure the strategic crossings of the Yellow River. Advancing in five columns, the 60,000 Japanese engaged in this operation met the usual stubborn resistance. Their communications were partially severed and their efforts to cross the river were balked. Indecisive fighting continued in this region throughout the year.

Meanwhile Chinese armies maintained pressure upon Japanese garrisons at Nanchang in Kiangsi, Yochow in Hunan, and various other points. Late in April the Chinese recaptured temporarily the capital of Honan Province, Kaifeng, which the Japanese had occupied since 1938.

**Capture of Ichang.** In an effort to drive a wedge between Chinese armies on the northern and southern fronts, the Japanese early in May launched another offensive from Sinyang on the Hankow-Peiping Railway westward along the Honan-Hupeh border toward the upper Han River valley. Again the invaders suffered heavy casualties and withdrew before fierce flank attacks. The Chinese claimed to have driven the Japanese out of their base at Sinyang.

Meanwhile a stronger Japanese force had launched the major offensive of the year from Hankow northwestward through Hupeh. Crossing the Han River, they captured Siangyang, 200 miles from Hankow, on June 3. From Siangyang the Japanese columns swung southward toward the Yangtze and on June 11 announced their most important military success of the year—the capture of Ichang, the most important river port between Hankow and Chungking. Shasi, another strategic river port, was occupied on June 10.

**Raids on Chungking.** A further Japanese advance from Ichang upon the Chinese capital at Chungking, 260 miles distant, was blocked by strong Chinese armies defending the difficult Yangtze gorges. Consequently, while severe but

indecisive fighting continued at various points along the extended front, the Japanese intensified their mass air raids on Chungking and other Chinese-held cities of the interior. The air attacks on Chungking began in May, when the clouds that concealed the provisional capital during the winter months cleared away. Throughout the summer the city was subjected to almost daily raids whenever weather permitted, with more than 150 bombers participating on occasions. Casualties ran into the tens of thousands, while most of the buildings were pulverized by high explosives or burned by great fires started by incendiary bombs.

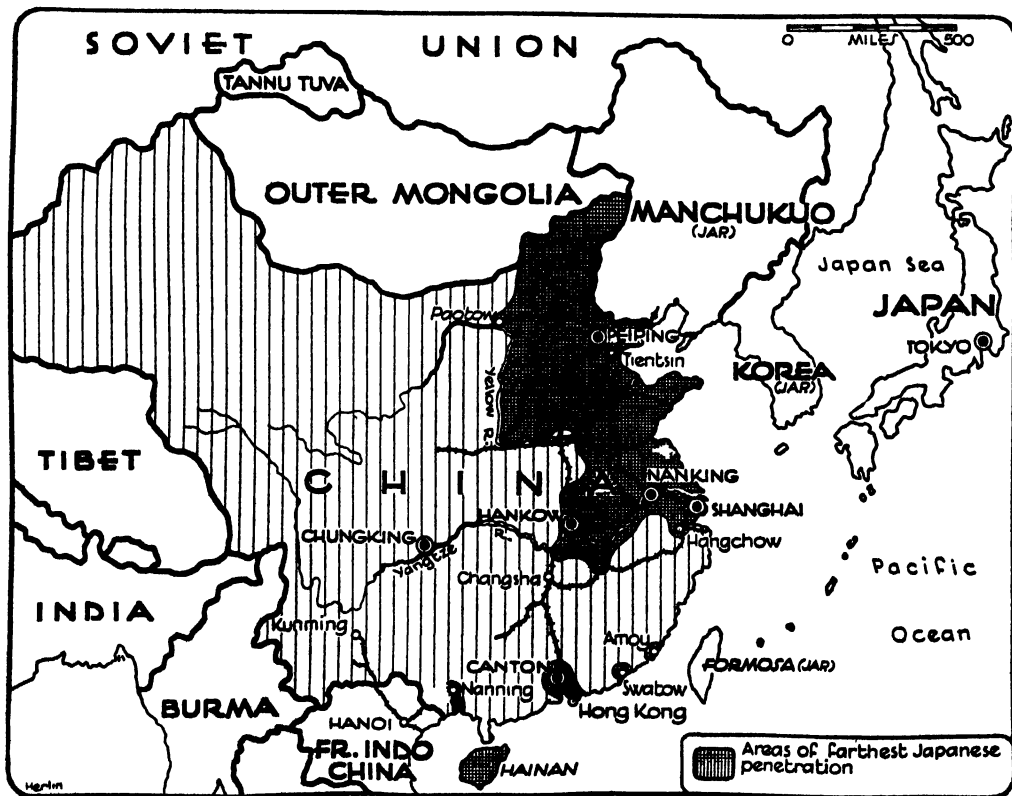

With the Japanese occupation of Hanoi and neighboring territory in French Indo-China in September, they gained new vantage points for extending bombing raids in South China. On September 30 they began destructive air attacks on Kunming, capital of Yunnan Province, and a key point on the Burma Road.

**Guerrilla Warfare Extended.** Undeterred by these raids, the Chinese during the summer and fall increased their military pressure upon the Japanese lines at various points, while innumerable guerrilla bands successfully harassed the invaders within the "occupied" territories. In August the Communist Eighth Route Army penetrated Japanese lines to the environs of Peiping and cut the Tientsin-Peiping railway line. In September a general attack upon Japanese garrisons

and outposts in occupied territories was begun by some 300,000 guerrillas. Railway and highway communications were repeatedly disrupted. In October the Chinese regulars reported important successes in South Anhwei Province, in Northern Kiangsi where the Yangtze port of Matang was recaptured, to the west of Nanchang in north central Kiangsi, in Chekiang Province, and at innumerable other widely scattered points. The extent of the conflict was indicated by Chinese announcements stating that 2889 separate engagements took place with Japanese troops during September.

**Japanese Shorten Lines.** On October 28 the Chinese recaptured Nanning, the capital of Kwangsi Province, taken by the Japanese in November, 1939. Soon afterward it was announced that the Japanese had abandoned all of the territory conquered in Kwangsi and were shortening their lines through south and central China. During November Japanese forces were withdrawn from Wai-chow Island off the Kwangtung coast and from Yamchow and surrounding territory in southwestern Kwangtung Province.

Some of the troops withdrawn from these sectors were reported to have been concentrated in Hankow, while others assembled at Kwangchow-an and Hainan Island in South China and at Haiphong in French Indo-China, apparently in preparation for an attack on French, British, and Dutch

#### RIVAL GOVERNMENTS IN CHINA

The areas of farthest Japanese military penetration in China were placed under the nominal rule of Wang Ching-wei's Japanese-sponsored regime on Mar. 30, 1940. Wang's nominal jurisdiction extended over an estimated 526,500 square miles of territory with 185,000,000 inhabitants. Gen. Chiang Kai-shek's Nationalist Government at Chungking retained control of an estimated 2,376,500 square miles with a population of about 237,708,000.

possessions. Late in November heavy fighting again broke out in central and northern Hupeh Province, northwest of Hankow. On December 4 the Chinese announced that they had inflicted one of the worst defeats of the war upon Japanese troops engaged in another offensive operation in that area.

The year ended with nearly a million Japanese troops still guarding the key cities and communication centers of the occupied provinces against Chiang Kai-shek's armies, estimated to number some five million men. Neutral military experts in China estimated in July that the war had already cost Japan more than 1,000,000 casualties including 200,000 killed, while Chinese military losses were placed at over 3,000,000 including 1,000,000 or more killed. An official Japanese report gave the number of Chinese killed up to Nov. 30, 1940, at 3,500,000 and the number of Japanese killed at 101,899.

**Wang Ching-wei's "Government."** Japan's recognition on November 30 of the puppet regime established at Nanking by Wang Ching-wei indicated that Nippon's army leaders had given up hope of forcing Chiang Kai-shek to accept their peace terms. Recognition of Wang had been forecast repeatedly since early in January, when the military and political authorities in Tokyo ratified the unpublished "peace agreement" reached between Wang and Japanese army commanders in Shanghai in December, 1939 (see YEAR BOOK, 1939, p. 143).

The Japanese military created Wang's puppet government to provide a basis for consolidating their gains in China. They hoped it would weaken Chiang Kai-shek's position and force him either to capitulate or reach a compromise settlement. In addition, Wang's regime was expected to aid in the pacification and economic exploitation of the conquered Chinese territories and to serve as a useful tool in pressing foreign interests in China to recognize Japan's "new order in East Asia."

This program encountered innumerable obstacles. In January two of Wang's Chinese supporters deserted to Chiang Kai-shek. They made public at Hong Kong the conditions which they said Wang had accepted in order to win Japanese support. Publication of these conditions, envisaging a permanent colonial status for China, alienated much of the support Wang had managed to enlist among the Chinese. Efforts to create a Chinese armed force under the nominal direction of Wang Ching-wei to aid the Japanese in their military struggle proved of little avail. Many of these soldiers deserted to Chiang Kai-shek with Japanese weapons, or mutinied against their Japanese officers. There were numerous assassinations of Wang adherents by Chinese gunmen, and Wang himself lived under heavy Japanese guard.

Moreover factionalism within the Japanese army prevented establishment of a centralized government for the Japanese-occupied areas. The separate puppet regimes established in North China and Inner Mongolia continued to take orders from the Japanese commanders in Peiping even after the establishment of Wang's "central government" on March 30. The Tokyo Government advanced Wang 60,000,000 Chinese dollars in cash and in April sent ex-Premier Nobuyuki Abe to Nanking to conclude a formal treaty with Wang's "government." However the signing of this accord was repeatedly postponed, while the Japanese made under-cover efforts to negotiate a settlement

with Chiang Kai-shek. In May, in July, and again in November the Japanese submitted peace proposals to the Nationalist leader, but he continued to insist upon "complete and unconditional withdrawal of all Japanese forces from China."

**Terms of Nanking Accords.** General Abe finally signed the treaty "readjusting Chinese-Japanese relations" in Nanking on November 30. The treaty pledged the co-operation of the Wang and Tokyo Governments in "establishing a new order," eradicating mutually hostile propaganda and fighting communism. It gave Japan special rights to control and exploit the natural resources of Inner Mongolia and North China and to station troops in those regions permanently. Wang also agreed to give Japan and its subjects "positive and full facilities" in trade and economic matters. All Chinese territory was opened to Japanese residence and business in return for Japan's relinquishment of her concessions and extraterritorial rights in China.

In addition to this basic treaty, there was signed at the same time a protocol governing relations between Tokyo and Nanking during the continuance of hostilities with Chiang Kai-shek, a supplementary understanding, and a joint declaration by the governments of Japan and Manchoukuo and the Wang administration. In the protocol Wang authorized the Japanese to take all necessary war measures, while the Japanese undertook to commence the evacuation of troops from China when the war ended and to complete it within two years except for special areas in North China and Inner Mongolia. Evacuation, however, was conditional upon the restoration of peace and order in China by the Wang regime.

The supplementary understanding provided for the transfer to the Wang regime of the Japanese Army's tax-collecting machinery in China. It called for the return to Chinese control of mines, industries, and commercial establishments seized by the Japanese and for a readjustment of the Chinese share in joint Chino-Japanese enterprises. It also admitted the Nanking regime's right to tariff autonomy subject to the maintenance of the principle of Chino-Japanese co-operation in establishing the "new order in East Asia." This, the official Japanese news agency pointed out, meant Nanking's co-operation with Japan "against powers who oppose the new order," particularly the United States. In the joint declaration, Wang's regime formally recognized Manchoukuo (q.v.) as an independent state—a concession which the Japanese had sought since 1931 to obtain from Chiang Kai-shek's Nationalist Government. Japan and Manchoukuo in return recognized the Nanking administration as the national government of China.

**Japanese Economic Measures.** The economic clauses of the foregoing accords were designed to provide a legal basis for the ambitious measures already taken or projected for making China an economic as well as a political protectorate of Japan (see YEAR BOOK, 1939, p. 143 f.). By currency manipulation, the control of customs, trade regulations and communications, military pressure, etc., the Japanese worked energetically throughout the year to drive out foreign and other influences opposed to the Japanese program and to bring virtually all forms of economic activity under their direct or indirect control.

As in Manchoukuo, the principal method adopted was the monopoly system. Companies controlled

by Japanese but with both Japanese and Chinese capital were granted exclusive rights to operate and exploit natural resources, public utilities, etc., within specified areas. The secret agreement negotiated by Wang with the Japanese in December, 1939, allegedly called for the establishment of such monopolies over mineral deposits, railways, and other communications, water supplies, electricity, etc., in Central as well as North China.

According to the Tokyo director of the Economic Department of the Asiatic Development Board, investments of this character made by the Japanese Government in China during 1939 totaled 285,000,000 yen (247,000,000 yen in North China and 38,000,000 yen in Central China). The rich rewards in prospect for the Japanese once China was subjugated and order restored were indicated by the North China Development Company's announcement of a net profit of 2,200,000 yen in 1939 on total revenues of 6,100,000 yen. This company was organized by the Japanese Government in 1938 to finance and supervise the economic exploitation of North China (see *YEAR BOOK*, 1938, p. 157).

Another step to strengthen Japanese economic control was the announcement at Nanking on December 9 that Wang's regime would open a new central bank December 15, the notes of which would replace those of the Chungking Government as legal currency in all Japanese-occupied parts of China.

**The Chungking Government.** The progressive revelation of Japan's sweeping political and economic aims in China deprived Wang Ching-wei of all but a vestige of Chinese support and enabled Chiang Kai-shek to continue the struggle with growing prospects of success. The only important defection during the year was that of Gen. Shih Yu-shan, former governor of Chahar Province and outstanding war lord, who was executed early in December for conniving with Wang Ching-wei.

During 1940 Chiang's government made further progress, despite Japanese air raids, in converting the free provinces of Western China into a military, economic, and cultural base for protracted warfare with Japan. New mines were opened, light and heavy industries established, motor roads constructed, universities, schools, and military training centers founded. Chinese arsenals and munitions factories produced most of the arms and ammunition needed for mobile and guerrilla warfare. The phenomenal development of producers and consumers co-operatives continued.

In June China's major supply route through French Indo-China was cut permanently through Japanese military pressure on the French authorities. Shortly afterwards the British yielded to Japanese pressure and ended the munitions traffic over the Burma Road. This left the Chungking Government entirely dependent upon the Soviet Union and the long motor route through Sinkiang for imported supplies, until the British Government reopened the Burma Road in October. The Chinese used the three months during which the Burma Road was closed to improve it and to push construction of a network of local highways to feed into and supplement this vital traffic artery. Reports toward the end of 1940 indicated that truck traffic over the Burma Road was proceeding despite Japanese efforts to bomb bridges and other weak links in the highway.

It was reported in December that another supply route for Chiang's armies had been opened

from Vladivostok via the Trans-Siberian Railway to Chita or Verkhneudinsk, from there to Urga in Outer Mongolia by military road, and thence to Ningsia and Lanchow by truck or caravan. See map in *YEAR BOOK*, 1938, p. 152.

The major internal threat to the Chungking government was the continuance during the first months of 1940 of the struggle between its Communist and anti-Communist supporters in and around the Shensi-Kansu-Ningsia border region, the stronghold of the Communist Eighth Route Army (see *YEAR BOOK*, 1939, p. 142). Early in April the Central Government negotiated an agreement between the Communists and anti-Communists, which for the time being ended their undeclared war. The area of the Communist-controlled region was reduced, the district in which Communist military units were to operate was delimited, and Chungking undertook to support six instead of three regular divisions of the Eighth Route Army. Friction between Communists and anti-Communist elements continued, but not on a scale preventing effective military operations against the Japanese.

During April 1-10 the fifth session of the Kuomintang People's Political Council was held in Chungking. It approved the final revised draft of a new Constitution, to be submitted to a National Assembly in November in accordance with the decision reached by the party's Central Executive Committee the preceding year (see *YEAR BOOK*, 1939, p. 141).

The regions under Chungking's control were reported to be better off economically than those of the Japanese-occupied areas. Floods, guerrilla activities, and the exactions of the Japanese produced serious food shortages in the Tientsin-Peiping area. There was famine in rural districts of Hopei Province in the north and in Eastern Kwangtung in the south, where cannibalism was officially admitted. In many other districts of both occupied and free China, inflated prices and scarcities caused hunger riots and other disorders.

**Drive against Western Powers.** The Japanese made much more definite progress in their campaign to oust the Western powers from China than in their military and diplomatic struggle with Chungking (see *YEAR BOOK*, 1939, p. 143 f., for background). By the end of 1940 France and Great Britain had been forced to give up practically all of their footholds in China, with the exception of British-owned Hong Kong. Only the stubborn opposition of the United States prevented Japanese seizure of the Foreign Settlement at Shanghai.

On March 28, the British Ambassador at Tokyo tacitly acquiesced in the establishment of Wang's Nanking regime. A Japanese effort to gain control of the Shanghai Municipal Council in the April elections was rebuffed, but on June 19 Britain and France capitulated to Japanese pressure at Tientsin, where the foreign settlement had been blockaded since 1939 by local Japanese military authorities. They agreed to accept Japanese "help" in policing their concessions, to permit the circulation of the Japanese-sponsored currency, to turn over 10 per cent of the Chinese Government's silver stocks held in the concessions to the Japanese for relief purposes, and to seal the remainder pending final disposition.

On June 20 the French Ambassador, following the example of the British Ambassador a year before, formally recognized Japan's "special require-

ments" in China. He pledged that French nationals and authorities there would not be permitted to obstruct or hamper Japan in prosecuting the war against Chiang Kai-shek. A few days later French authorities in Shanghai, without consulting other foreign defense forces, turned over one of their defense sectors to the Japanese. At the same time the French agreed to stop virtually all shipments of supplies to China through French Indo-China and to permit Japanese inspectors to supervise the remaining traffic.

While Japan proceeded to win a stranglehold upon French Indo-China (q.v.), further pressure was applied to the British. On June 24 Tokyo demanded that Britain stop shipments of supplies to China through Hong Kong and Burma. The demand was rejected on July 8. But on July 12, after further Japanese pressure, Britain agreed to close the Burma Road for three months to shipments of arms, ammunition, gasoline, trucks and railway material, and to prohibit exports of the same categories of goods from Hong Kong. The British action was linked with an appeal for a Chino-Japanese peace, but this was bluntly rejected by Chiang Kai-shek.

During July the Japanese and Chinese associates acting under Wang Ching-wei's orders also instituted a reign of terror in the International Settlement at Shanghai. There were assassinations and assaults. American marines arrested 16 armed Japanese gendarmes in civilian clothes discovered in the American defense sector.

On August 9 the British Government ordered the withdrawal of its troops from North China and Shanghai. The 200 British troops in Tientsin and Peiping withdrew August 18, leaving 250 American marines in Peiping and 100 in Tientsin in addition to about 230 French and 130 Italian troops divided between the two cities. Departure of 1570 British troops from Shanghai on August 23-25—ending a century of British control of the International Settlement—provoked a serious controversy between American and Japanese authorities in Shanghai and their respective governments. The Shanghai Defense Committee, on which commanders of the foreign troops were represented, placed the defense of the sector vacated by the British in the hands of the American marines. The Japanese refused to accept this arrangement. Accordingly the British sector was turned over to the Shanghai Volunteer Corps, a local militia, while Tokyo and Washington sought to negotiate a settlement.

While these negotiations proceeded, the Japanese intensified their tactics of terrorism and intimidation toward Americans and British remaining in the International Settlement. Anti-Japanese gunmen were also active. These numerous incidents threatened repeatedly to precipitate an armed clash between American and Japanese forces. It was under these circumstances, combined with growing tension between Washington and Tokyo, that many American private citizens began to leave Shanghai for Manila and other points, on the advice of the State Department, early in October.

The British retreat before Japanese threats was checked on October 9, after Japan concluded its alliance with Germany and Italy. Prime Minister Churchill announced that the Burma Road would be reopened, effective October 17, and indicated that Britain would extend further financial and technical aid to China. On December 10 London

announced another credit of £10,000,000 to Chungking. Negotiations for an Anglo-Chinese alliance were reported in progress at the year end.

**United States Policy.** Throughout this critical year for foreign interests in China, the major obstacle to Japan's anti-foreign drive was the attitude of the Washington Government. It firmly opposed violations of its treaty rights in China by Japan and gave repeated encouragement to Chungking. On March 7 the Export-Import Bank of Washington advanced a \$20,000,000 loan to China, to be repaid by shipments of Yunnan tin to the United States. On March 30, the day Wang Ching-wei's regime was established, Secretary Hull scored this move as another attempt "of one country by armed force to impose its will upon a neighboring country." He said the United States would continue to recognize the Chungking Government as the government of China.

Early in July the American Government curtailed shipments of machine tools, petroleum, and scrap metals to Japan. On July 16 it protested against the British decision to close the Burma Road. Repeated protests were made against the indiscriminate Japanese bombing of Chungking and other Chinese cities as well as Japanese air attacks upon American mission and other properties in China. On September 25 the Export-Import Bank of Washington advanced China another loan of \$25,000,000, secured by \$30,000,000 worth of Chinese tungsten. Upon Japan's ratification of the treaties with Nanking, the United States on November 30 advanced additional credits of \$100,000,000 to Chungking—\$50,000,000 by the Export-Import Bank and \$50,000,000 from the U.S. Treasury stabilization fund. Like the preceding loans, these were to be covered by purchases of Chinese tungsten, antimony, and tin.

**Soviet Role in China.** In order to facilitate its advance against the French, British, and Dutch possessions in southeastern Asia and Malaya, the Tokyo Government strove throughout 1940 to neutralize the Soviet Union. The Soviet-Japanese dispute over the Manchoukuoan-Mongolian frontier was settled in Russia's favor on June 9. The Japanese also proposed the division of all China into Soviet and Japanese spheres of influence, provided Moscow withdrew its support of the Chungking Government. Negotiations to this end were still under way in Moscow, with German support, when the year ended.

Meanwhile Moscow continued to send war materials and other aid to Chiang Kai-shek, obtaining in return further concessions in Sinkiang. By threatening in January to cut off its aid, the Soviet Government forced Chungking to negotiate a settlement satisfactory to the Communists of the unofficial civil war between Kuomintang and Communist forces in northwestern China. In April Chiang Kai-shek sent Shao Li-tse, leader of the left-wing faction of the Kuomintang, as his new ambassador to Moscow to secure increased Soviet assistance. On July 27 the conclusion of a new Soviet-Chinese trade treaty was announced. The Soviet Government on December 6 informed Japan that Moscow's policy with regard to China remained unchanged. This meant that Russia would continue to support the Chungking Government despite Japan's recognition of Wang Ching-wei's regime.

BET, and UNION OF SOVIET SOCIALIST REPUBLICS under *History*; INDUSTRIAL CHEMISTRY; UNITED STATES under *Foreign Affairs*.

**CHINCH BUG.** See ENTOMOLOGY, ECONOMIC. **CHOSEN.** See KOREA.

**CHRISTIAN FRONT.** See FASCISM; NEW YORK.

**CHRISTIAN REFORMED CHURCH.** See RELIGIOUS ORGANIZATIONS.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1866 and set forth in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs. Eddy in Boston in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston, but called more frequently by its adherents "The Mother Church." The total number of recognized branches of The Mother Church in the United States reported for the fiscal year ending May 31, 1940, was 2176 and 74 college and university organizations. Total branches for the world 2858.

The affairs of The Mother Church are administered by a board of directors which supervises the work of the board of education, board of lectureship, and committee on publication. The board of education instructs and authorizes students to teach Christian Science. The board of lectureship consists of 23 members who are engaged in delivering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the Manual of the church, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian languages, each with the English translation opposite, and in Braille.

The benevolent association of the church conducts sanatoria in Brookline, Mass., and San Francisco, California. Pleasant View Home at Concord, N.H. is a home for Christian Scientists of advanced years. Mrs. Margaret Matters is president of The Mother Church for the year 1940-41. Headquarters are at 107 Falmouth Street, Boston, Mass.

**CHROMIUM.** This strategic metal was the subject of deep interest and concern in 1940 on account of its importance as a war mineral. The shipping situation was critical, and freight rates were high. The principal countries of production were Turkey, Cuba, Rhodesia, and the Philippines. Imports of ore for the year 1940 aggregated 657,689 gross tons containing 301,672 tons  $\text{Cr}_2\text{O}_3$ , valued at \$8,754,770. The price in December, 1940, for metallurgical grade ore, 48 per cent  $\text{Cr}_2\text{O}_3$  was \$32-34 per long ton, c.i.f. Atlantic ports; 43-45 per cent refractory ore brought \$22-24; intermediate grades \$28-30. All prices were nominal. The Geological Survey and Bureau of Mines made extensive explorations for chrome ore in Montana, Wyoming, and Oregon without discovering much ore of metallurgical grade. Some was found suitable for refractory and chemical uses. U.S. consumption of all three grades of chrome ore—metallurgical, chemical, and refractory—was about 500,000 tons. See GEOLOGY.

H. C. PARMELEE.

**CHRONOLOGY.** The following chronology lists the more important happenings of the year 1940 according to the dates of occurrence. In most cases, these events are treated in detail under their respective headings. To such articles, particularly those on leading countries and states, such as UNITED STATES, GREAT BRITAIN, and NEW YORK, the reader is referred for additional information. For a list of prominent persons who died during the past year, reference should be made to the article NECROLOGY and the more important obituary notices there listed. See also EUROPEAN WAR for important military events.

#### JANUARY

- 1—German freighter, *Tacoma*, interned by Uruguay as a naval auxiliary.
- 2—United States protested to Britain against the seizing of American mail on neutral ships.
- 3—Soviet Union and Japan agreed on demarcation of Manchoukuo—Outer Mongolian borders.
- Seventy-sixth Congress convened at Washington.
- 4—President Roosevelt's budget message foresaw a 1940-41 deficit of \$1,716,000,000.
- Attorney General Frank Murphy was appointed to U.S. Supreme Court. Robert H. Jackson named Attorney General.
- Irish parliament gave Prime Minister de Valera special powers to deal with Irish Republican Army agitation.
- 5—Negotiations for United States-Argentine reciprocal trade treaty collapsed.
- 6—King Carol stated that Rumania was determined to defend her borders from invasion.
- 8—Finland destroyed another Russian division.
- Japanese Cabinet approved Wang Ching-wei's terms for establishing pro-Japanese regime at Nanking.
- Stricter deportation law was passed by U.S. Senate.
- Australia and United States established direct diplomatic relations.
- 10—An explosion in Bartley No. 1 coal mine, Bartley, W.Va., killed 91 men.
- 11—Dr. Carlos Arroyo del Rio won Presidential election in Ecuador.
- 13—Belgian soldiers on leave were called back to their posts.
- 14—Furloughs of all British soldiers in France were cancelled.
- Admiral Mitsumasa Yonai named Premier of Japan.
- 15—Russia protested against Swedish and Norwegian aid to Finland.
- Charged with plotting to overthrow U.S. Government, 17 young men, almost all members of the Christian Front, were arrested in New York City.
- 16—President Roosevelt urged financial aid to Finland.
- Great Britain announced loss of three submarines.
- 19—Senator William E. Borah of Idaho died.
- 20—Winston Churchill warned neutrals of Europe that war was inevitable for them and asked them to join the Allies.
- 21—British destroyer *Grenville* and 81 men lost.
- 22—British destroyer *Esmond* and 175 men lost.
- Earl Browder, U.S. Communist leader, was convicted in New York Federal court of using a passport that was falsely obtained.
- Japan protested British seizure of 21 Germans on Japanese ship. Partial settlement was reached February 6.
- 23—Dies Committee was extended for another year by U.S. House.
- 25—Canadian Parliament was dissolved and a general election called for March 26.
- 27—The *City of Flint*, an American freighter, arrived in the United States, after a 116-day voyage through European waters, part of the time under control of a German prize crew.
- Ex-Premier J. B. M. Hertzog's motion to restore peace with Germany was defeated in South African House of Assembly, 81 to 59.
- 28—The Vatican released a denunciatory report on conditions in German-occupied Poland.
- 30—Hitler asserted that the second or more active part of the war was at hand.

#### FEBRUARY

- 1—Russians began heavy assault on Finland's Mannerheim Line.
- 2—Finland asked Soviet Union for "honorable peace."
- U.S. Senate increased the lending authority of the Export-Import Bank, thereby making a loan to Finland possible.
- 7—Two Irish Republican Army members were hanged in Birmingham, England, for complicity in bombing outrage.

9—President Roosevelt sent Under-Secretary of State Sumner Welles on diplomatic tour of Europe.  
10—French Chamber of Deputies gave Daladier Government unanimous vote of confidence.

11—Costa Rican Presidential election was won by Dr. Rafael Angel Calderón Guardia.

12—First contingent of 30,000 Australian troops arrived in Egypt.

Trade treaty between Soviet Russia and Germany signed in Moscow.

14—Finland called the class of 1897 to the army and avowed that she would not surrender to Russia.

15—Great Britain offered, unofficially, to provide convoys for all shipping, regardless of destination.

Prof. Bogdan Philov was called to form a new Bulgarian government.

17—British destroyer *Cossack* invaded Norwegian waters to board the German prison ship *Altmark*, rescuing 326 British captives.

18—President Roosevelt inspected defenses of the Panama Canal.

President Estigarribia established a dictatorship in Paraguay.

19—British destroyer *Darling* was torpedoed and sunk with a loss of 157 men.

20—Russians captured Koivisto, key fortress of Mannerheim Line.

21—Soviet planes bombed a Swedish town near the Finnish border. Sweden accepted Soviet explanation that it was a mistake.

22—Rumania called to the colors all army reserves and barred export of all war material.

24—Prime Minister Chamberlain declared that Britain would never surrender to the present German government.

26—Sumner Welles conferred with Mussolini in Rome.

27—Myron C. Taylor was presented to the Pope as the personal representative of President Roosevelt.

### MARCH

1—Russians entered Vipur (Viborg) after breaking Mannerheim Line.

All-India National Congress executive committee authorized civil disobedience campaign to further independence.

2—Sumner Welles conferred with Chancellor Hitler.

4—Italian ships freighting German coal to Italy were seized by British warships.

6—Russia submitted peace terms to Finland through Sweden.

Land distributed among peasants by Spanish Republic was returned to grantees by decree of Franco Government.

7—The world's largest passenger liner, *Queen Elizabeth*, arrived in New York City.

King Carol reaffirmed Rumania's neutrality in European struggle.

10—Gen. Enrique Peñaranda del Castillo was elected President of Bolivia.

11—Allies proffered full military aid to Finland.

12—The Russo-Finnish war ended with the signing of a peace treaty.

16—President Roosevelt proclaimed his basic terms for "a sound peace."

Sumner Welles returned to Italy for a conference with Mussolini, Count Ciano, and the King.

An explosion in the Willow Grove coal mine, St. Clairsville, Ohio, killed 73 miners.

17—District Attorney William O'Dwyer revealed a crime syndicate in Brooklyn, New York, which committed murder by contract.

German air raiders bombed British fleet anchorage at Scapa Flow.

18—Hitler and Mussolini conferred at Brenner Pass.

19—James H. R. Cromwell, U.S. Minister to Canada, made a pro-Ally speech in Toronto. He was reprimanded by Secretary Hull.

British planes raided German air base at Sylt.

20—Daladier retired as French Premier and was succeeded by Paul Reynaud.

26—Canada's Liberal Government was returned to office with bigger majority in general election.

28—Sumner Welles made his report to President Roosevelt upon his return to the United States.

29—Germany made public documents, claimed to have been obtained from captured Polish archives, which accused American diplomats of helping to bring on the war. They were branded as forgeries by U.S. officials named.

30—Wang Ching-wei's puppet government was established at Nanking.

### APRIL

2—The decennial U.S. census began.

British began an intensified blockade of Germany.

3—Prime Minister Chamberlain revamped his cabinet. Winston Churchill was given general supervision over all Britain's fighting forces.

U.S. Government asked Mexico to arbitrate dispute over expropriation of American-owned oil properties.

The Earl of Athlone was named Governor General of Canada.

4—Supreme Soviet of U.S.S.R. incorporated territory ceded by Finland in new Karelian-Finnish Soviet Socialist Republic.

5—President Roosevelt's power to negotiate reciprocal foreign trade agreements was extended for three years.

9—Germans occupied Denmark and invaded Norway, capturing Oslo, Bergen, Trondheim, and Narvik.

10—German supply line across the Kattegat and Skagerrak to Norway was attacked by British planes and warships.

11—Japan was defeated in attempt to gain control of Municipal Council of Shanghai's International Settlement.

13—British warships forced their way into Narvik harbor, sinking seven German destroyers.

16—British expeditionary force, arriving in Norway, was heavily attacked by German bombers.

17—Secretary of State Hull upheld status quo in Netherlands Indies.

18—A naval appropriation bill of \$963,797,478 was passed by U.S. Senate.

Thousands of Iron Guardists were liberated from Rumanian concentration camps by King Carol.

19—The Ford Motor Company was accused by the National Labor Relations Board of encouraging brutality against union workers in the Ford plant at Dallas, Texas.

Reynaud Cabinet received unanimous vote of confidence from French Chamber.

The Lake Shore Limited, New York Central express between New York and Chicago, jumped the track at Little Falls, N.Y.; 28 were killed, 70 injured.

23—Britain's 1940-41 war budget of £2,667,000,000 was published.

24—The German High Command announced that henceforth Germany would rule Norway with "unrestricted control."

27—Germany attempted to justify invasion of Norway by making public documents purporting to prove that the Allies planned a landing in Norway with Oslo's consent.

30—Germany captured Dombaa and control of the railway between Oslo and Trondheim.

### MAY

2—Philippine National Assembly applied an annual immigration quota of 500 to every nationality including the Japanese.

3—Mexican Government rejected United States bid to arbitrate oil controversy.

Allies were forced to quit Namsos and abandon southern Norway to Germans. The struggle for Narvik continued.

6—U.S. Supreme Court ruled that price-fixing agreement by Mid-West oil companies violated anti-trust laws.

Fire destroyed the municipal palace of Sandona, Colombia, during patriotic celebration, killing 103 persons and injuring 125.

Marshal Timoshenko replaced Marshal Voroshilov as Soviet Defense Commissar.

Chamberlain Government was upheld on foreign policy, 281 to 200, by British House of Commons.

10—Germany invaded the Netherlands, Belgium, and Luxemburg by land and air.

Chamberlain Government resigned and Winston Churchill formed new coalition cabinet with Labor leaders holding important offices. On May 13 both houses of Parliament unanimously endorsed the new government.

11—Allies rushed aid to the Low Countries.

13—German motorized column reached vicinity of Rotterdam, cutting the Netherlands in two. Queen Wilhelmina fled to London.

Dutch and British assured Japan no Allied troops would be landed in Netherlands Indies.

14—Dutch armies ceased resistance, except in Zeeland.

15—Battle of the Meuse began; Germans pierced the hinge of the Maginot Line at Sedan; occupied The Hague.

16—President Roosevelt requested Congress to appropriate \$1,823,000,000 for defense.

17—Germans penetrated 35 miles into France. The British were forced back in Belgium.

18—Germans took Louvain and Brussels in the north, while in the south they pushed to within 85 miles of Paris.

The 21 American republics jointly protested the German invasion of Belgium, the Netherlands, and Luxemburg.

19—Gen. Maxime Weygand succeeded Gamelin as French commander-in-chief.

20—Germans reached Laon, 75 miles from Paris.

21—German drive attained French coast at Abbeville, cutting off British, Belgian, and some French divisions from main French forces.

22—The Allies dug in on the Somme-Aisne front to protect Paris.

British Parliament passed a bill granting the government the right to conscript all persons and properties for defense purposes.

23—Sir Oswald Mosley, British Fascist leader, and many other suspected "fifth columnists" were interned.

24—Earthquakes rocked Lima, Peru, and the surround-

ing area, killing 350 persons, injuring 5000, and destroying many buildings.

25—France replaced 15 generals as German advance continued.

27—The Germans continued to tighten their ring around the Allied armies in Belgium and Northern France.

28—A Council of National Defense, similar to that of 1916, was appointed by President Roosevelt.

King Leopold ordered Belgian army to lay down its arms. The Belgian cabinet disowned the King, asserting government would continue to fight.

Some 400,000 Allied troops began the evacuation from Dunkirk under heavy German pressure.

The Allies captured Narvik, Norwegian iron-ore port, after a long siege.

30—Germany set up civil administration in the Netherlands.

31—President Roosevelt sent a special defense message to Congress requesting \$1,000,000,000 in additional appropriations.

Most of the B.E.F. reached England from Dunkirk.

# JUNE

1—Marseille, France, was bombed by German air raids.

2—Dr. Arnulfo Arias was elected President of Panama.

3—U.S. Senate approved an 11 per cent increase in naval ships and planes, costing \$654,902,270.

Paris was bombed by German planes; 254 persons killed. British evacuation from Dunkirk was completed.

5—Attorney General Jackson ruled that the sale of World War arms and ammunition to the Allies was legal. Approximately 1,500,000 Germans began a drive toward Paris on a 120-mile front from the English Channel to Laon.

6—U.S. Navy transferred 50 naval reserve planes to the Allies.

Premier Reynaud reshuffled his cabinet, dropping Daladier and naming Marshal Henri Pétain as Vice Premier.

8—Germans broke through French lines at four places; advanced to within 48 miles of Paris.

British merchant cruiser *Carinthia* was sunk by German submarine.

Drafting of new Cuban Constitution was completed by Constituent Assembly.

9—Norwegian army surrendered to Germany when the Allies withdrew from Narvik. King Haakon and his fugitive government moved to London.

Manchoukuo-Outer Mongolian border controversy was settled by Russia and Japan.

10—Italy declared war on France and England; the Germans crossed the Seine.

11—The Mediterranean was closed to American shipping by order of the President.

In an air crash near Newtonville, Canada, National Defense Minister Norman Rogers and three others were killed.

12—A \$1,706,053,908 supplemental defense appropriation was passed by the U.S. House.

The Germans crossed the Marne and took Chateau Thierry.

Egypt severed diplomatic relations with Italy.

13—Paris was declared an open city by the French.

Premier Reynaud's urgent "final" plea for aid from the United States was published.

14—The Germans marched into Paris, and pushed on to capture Le Havre and threaten Tours.

15—Germans broke through the Maginot Line on a wide front. The French fell back to the Loire River, 60 miles south of Paris.

16—The Maginot Line was abandoned; Verdun and Chaumont were captured.

17—Marshal Henri Pétain became Premier of France and asked Germany for peace terms; Britain announced that she would fight on alone.

Two bombers locked wings over Bellerose, Queens, N.Y., and crashed, killing 11 army men.

Senate resolution, adopted 76 to 0, warned that the United States would not recognize transfer from one European power to another of "any geographic region in the Western Hemisphere."

Mussolini met in Munich to draw up terms for the French armistice.

19—U.S. Government warns the European belligerents that it will not permit any transfer of territory in the Western Hemisphere from one non-American power to another.

Anglo-Japanese accord was reached ending Japan's blockade of British concession in Tientsin, China.

20—Two Republicans, Henry L. Stimson, former U.S. Secretary of State, and Col. Frank Knox, candidate for Vice-President in 1936, were named Secretary of War and Secretary of the Navy, respectively.

21—Selective military service bill was introduced in U.S. House.

French received German armistice terms at Compiègne in same railway car in which World War armistice was signed.

Rumania was transformed into completely totalitarian state by King Carol's order.

22—Franco-German armistice was signed.

23—U.S. Minister in Montevideo assured Uruguay of Washington's readiness to co-operate in suppressing threatened revolt by German Nazis. Brazil offered similar aid.

24—Republican National Convention opened in Philadelphia.

Armistice between France and Italy was signed, and fighting in France came to an end early the next day.

27—Wendell Lewis Willkie was nominated by the Republicans for President, with Charles Linna McNary as his running mate for Vice-President.

Rumania ceded Bessarabia and Northern Bukovina to Russia.

# JULY

1—Rumania renounced Anglo-French guarantee of her independence.

3—British Navy moved to take over all scattered units of the French fleet; attacked warships at Oran.

Ill health prompted President Ortiz of Argentina to transfer his powers temporarily to Vice-President Ramon S. Castillo.

4—At the New York World's Fair, a bomb found in the British Pavilion exploded when taken outside, killing two policemen and injuring two others.

5—Pétain Government severed relations with Britain.

7—The government candidate, Gen. Manuel Avila Camacho, was declared elected in Mexico's Presidential poll.

9—Duke of Windsor was appointed governor and commander-in-chief of the Bahama Islands.

10—President Roosevelt asked Congress for an additional emergency defense appropriation of \$4,848,171,957; he stated that the administration would not send troops overseas.

French Parliament voted for a totalitarian regime and went out of existence.

11—U. S. Congress completed action on the "two-ocean" navy bill.

Marshal Pétain assumed the full powers of dictator of France.

14—Prime Minister Churchill declared that Britain was ready to continue fighting for years.

Col. Fulgencio Batista, "strong man" of Cuba since 1933, was elected President.

14-15—With candidates restricted to the Communist-controlled "Working People's Bloc," parliaments pledged to "closer union" with Soviet Russia were chosen in Estonia, Latvia, and Lithuania. On July 21 the three countries proclaimed themselves soviet republics and asked for incorporation in Soviet Union.

15—The Democratic National Convention opened in Chicago.

Explosion in a coal mine at Sonman, Pa., killed 63 miners.

16—War Cabinet, including two Opposition leaders, was formed by New Zealand's Labor Government.

17—President Roosevelt was renominated for a third term. His selection for the Vice-Presidency, Henry A. Wallace, was nominated July 18.

Britain was warned by General Franco that Nationalist Spain expected cession of Gibraltar.

18—Prime Minister Churchill announced that Britain had agreed to close the Burma Road to Chinese munitions shipment for three months.

19—Hitler, in Reichstag speech, said Britain must end the war or the British empire would be destroyed.

20—The "two-ocean" navy bill was signed by President Roosevelt.

21—Foreign Ministers of the 21 American republics met in Havana to discuss measures for mutual defense against overseas threats.

22—Prince Konoye formed totalitarian Japanese government.

24—The Pétain Government revoked the citizenship and confiscated the property of ex-Premier Daladier and other former French leaders.

25—President Roosevelt barred export of American oil and scrap metal, except under special license.

27—European colonies in Western Hemisphere threatened with transfer to Germany would be taken over by a joint trusteeship of Pan American countries under agreement reached at Havana Conference.

29—Germany launched mass air raid against Britain.

30—In Anatolia, earthquakes shook down 14 villages and killed more than 1000 persons.

31—President Roosevelt embargoed export of aviation-type gasoline to countries outside of the Western Hemisphere.

Britain extended the blockade to the entire European continent.

# AUGUST

3—Royal Air Force began a more intensive bombing of German factories and naval concentrations.

4—Britain withdrew her troops from Shanghai and North China.

6—United States-Soviet trade agreement was renewed for fourth consecutive year.

British Somaliland invaded by Italians.

8—James A. Farley resigned as U.S. Postmaster General.

U.S. Senate passed bill authorizing President to mobilize National Guard for training and service within the Western Hemisphere.

Hundreds of German bombers intensified German raids on Channel convoys and British towns.

14—British airmen bombed Italian airplane factories.

15—Japan became a one-party State with dissolution of the Minseitō party.

17—Wendell L. Willkie formally accepted the Republican nomination for the Presidency.

President Roosevelt and Prime Minister Mackenzie King of Canada agreed to establish a joint United States-Canadian defense board.

Germany announced a total blockade of waters around Britain.

19—Italy conquered British Somaliland.

Claude B. Wickard succeeded Secretary of Agriculture Henry A. Wallace.

20—Prime Minister Churchill in report to House of Commons announced plan to lease bases in the Western Hemisphere to the United States.

Leon Trotsky was assassinated in Mexico City.

21—Rumania agreed to cede Southern Dobruja to Bulgaria.

22—The Canadian-United States joint defense board members were appointed.

23—President Roosevelt urged Congress to approve military conscription bill within two weeks.

24—Jesse H. Jones succeeded Harry L. Hopkins as U.S. Secretary of Commerce.

Argentine Congress voted 170 to 1 to reject proffered resignation of President Ortiz, thus blocking an anti-democratic conspiracy.

27—The National Guard mobilization bill was signed by President Roosevelt.

Alien registration began in the United States.

28—The Burke-Wadsworth conscription bill was passed by the U.S. Senate.

29—Japanese submarine sank in a storm during maneuvers south of Tokyo Bay; 100 sailors lost.

30—Rumania was compelled by Germany and Italy to cede part of Transylvania to Hungary.

31—Frank O. Walker succeeded James J. Farley as U.S. Postmaster General.

Airliner crash near Lovettsville, Va., killed Sen. Ernest Lundeen of Minnesota and 20 others.

#### SEPTEMBER

1—Sixty thousand U.S. National Guardsmen were called to active service for one year, beginning Sept. 16, 1940.

Two rival congresses were inducted in separate meetings in the Mexican capital.

3—President Roosevelt announced that 50 over-age destroyers would be given to Britain in exchange for naval and air bases in Newfoundland, Bermuda, the British West Indies, and British Guiana.

4—Secretary Hull warned Japan against interference in French Indo-China or the Netherlands Indies.

Hitler threatened to raze British cities if night bombing of Germany continued.

Following an abortive Iron Guard revolt, King Carol dissolved his puppet parliament, suspended the Constitution, and granted dictatorial powers to a new Premier, General Antonescu. On September 6, amid Iron Guard rioting in capital, Carol abdicated in favor of his son, Prince Michael, and fled to Switzerland with his mistress, Magda Lupescu.

5—Prime Minister Churchill defied Hitler, stating that warfare would soon become intensified.

6—Congressional action on the \$5,000,000,000 U.S. defense bill was consummated.

7—The Burke-Wadsworth conscription bill passed the U.S. House.

London was subjected to the heaviest aerial bombing of the war.

The Pétain Government interned ex-Premiers Daladier and Reynaud and General Gamelin.

General Antonescu assumed title of chief of State in Rumania and took over four posts in the new cabinet.

President Estragarrribia of Paraguay, commander of the republic's armies during the Chaco War, was killed in an airplane crash.

9—President Roosevelt signed the \$5,000,000,000 defense bill; contracts were let for 200 warships.

12—The Hercules Powder Company's plant, at Kenil, N.J., was wrecked by fire and explosions causing the death of 51 workers.

13—Buckingham Palace was bombed by German air raiders.

14—Speaker William F. Bankhead of the U.S. House of Representatives died.

Italy invaded Egypt.

15—British claimed that 185 German planes were destroyed in the heaviest air battle of the war over Britain.

16—President Roosevelt signed the Burke-Wadsworth bill.

17—Storms broke up a heavy concentration of German barges and supply ships in the English Channel.

20—Congress authorized \$1,500,000,000 increase in lending powers of Reconstruction Finance Corporation, two-thirds for purchase of strategic materials and aid to defense industries and one-third for development loans to Western Hemisphere countries through the Export-Import Bank.

21—Australian parliamentary deadlock was tightened by Labor gains in general election.

Eight German Nazi leaders in Uruguay were arrested on charge of plotting revolt.

22—British ship carrying refugee children and adults to Canada was torpedoed, with heavy casualties.

France, under strong pressure, agreed to entry of 6000 Japanese troops and establishment of air bases in northern part of French Indo-China. Unauthorized Japanese forces crossed border from China and attacked French and native troops.

23—Nazi press warned Greece and Turkey to recant their ties with England.

24—United States relinquished control of customs collections in Dominican Republic.

A Defense Communications Board was created by the President to co-ordinate U.S. communication systems.

25—China obtained \$25,000,000 loan from the United States.

German Commissioner in Norway placed all civil affairs in the hands of the Norwegian traitor, Major Vidkun Quisling, and ordered dissolution of parliament, the monarchy and the political parties.

"Free French" and British attack on Dakar was repelled after three-day struggle.

26—President Roosevelt placed embargo on export of scrap steel and iron, except to the Western Hemisphere and Great Britain.

A \$20,000,000 U.S. Government credit was granted Brazil for the construction of a large steel mill.

Two thousand Japanese troops landed at Haiphong, French Indo-China.

27—U.S. Senate unanimously ratified Havana Convention, which established inter-American machinery to prevent transfer of sovereignty or control over European colonies in the Western Hemisphere to a non-American state.

Japan signed a military alliance with Germany and Italy.

30—Berlin was bombed for five hours by English planes.

Japanese air raiders bombed Kuning, capital of Yun-nan Province, China.

#### OCTOBER

1—Rationing of foodstuffs in unoccupied France began.

2—U.S. Navy Department announced plans for early establishment of Atlantic naval force of 125 ships plus airplanes.

3—U.S. Attorney General warned that government might withhold defense contracts from firms violating National Labor Relations Act.

Neville Chamberlain resigned from Churchill Cabinet.

4—Hitler and Mussolini met at Brenner Pass for another conference.

6—General Antonescu assumed leadership of Rumanian Iron Guard.

7—London reported that up to September 30 the Royal Air Force had bombed more than 200 "military objectives" in Germany and German-occupied territory.

8—President Roosevelt signed the Excess Profits Tax-Amortization Bill.

U.S. Government advised Americans to leave the Far East.

9—Prime Minister Churchill was elected leader of the Conservative party in Britain.

Col. Fulgencio Batista was inaugurated as President of Cuba.

10—German troops moved into Rumania; Bulgaria began partial mobilization.

Foreign Minister Matsuoka stated that Japan's alliance with Germany and Italy was not directed against the United States.

11—President Roosevelt ordered "freezing" of Rumanian credits in the United States.

Germany admitted widespread damage by British bombers.

12—Clarence A. Dykstra, president of University of Wisconsin, was appointed National Director of Selective Service by President Roosevelt.

14—All-India National Congress began organization of passive resistance campaign to secure independence.

15—Wendell L. Willkie accused Roosevelt administration in Buffalo, N.Y., speech of delaying defense preparations.

British Admiralty reported lowest week's shipping losses in five months.

16—Registration of about 16,000,000 men between 21 and 35 took place under U.S. Selective Service Act. Germans continued heavy air attacks on England. British destroyed German convoy of three supply ships and two escorts.

Berlin began evacuation of children due to British air raids.

18—Ramón Serrano Suñer, Franco's brother-in-law and leader of Falangist (Fascist) movement, became Foreign Minister of Spain.

Jews were barred from high public office and from the press, radio, and movies by decree of the Vichy Government.

Burma Road was reopened by British.

19—London reported that 6954 persons had been killed by air bombing during preceding month.

Japanese airplanes bombed key stations and bridges along the Burma Road.

21—Italian planes bombed Cairo for first time.

22—President Roosevelt established a defense priorities board; requisitioned 110 military planes ordered in United States by Sweden.

London advised British subjects in Japan and Japanese-occupied territories to leave.

23—Japan denounced Bering Sea fur-seal treaty. Hitler and General Franco conferred at the French-Spanish border.

24—Vichy Government was warned by President Roosevelt that French colonies in Western Hemisphere would be occupied under Act of Havana if it gave military aid to Germany.

U.S. War Department announced reinforcement of its air squadrons in Philippines.

25—Military pact between Britain and exiled Czechoslovak Government signed.

John L. Lewis, head of the C.I.O., urged labor to vote for Republican Presidential candidate. He said he would resign his post if President Roosevelt were re-elected.

26—Liner *Empress of Britain* was sunk off the Irish coast.

27—Establishment of a "Free French" government was announced by Gen. Charles de Gaulle in London.

28—Pierre Laval, Vice Premier of Pétain Cabinet, was named Foreign Minister to undertake negotiations with Germany.

Chinese troops recaptured Nanning.

Greece was invaded by Italy.

29—The selection of prospective draftees under U.S. Selective Service Act began.

German planes dropped tons of explosives on English coastal towns and industrial centers in the Midlands.

England admitted shipping losses during the week of October 14-21 were the greatest of either World War—32 vessels totaling 146,528 tons.

30—Reiterating his pledge not to send American youths into foreign wars, President Roosevelt said in Boston campaign speech that U.S. industry had undertaken to produce 12,000 more warplanes for Britain.

31—British Government ordered large number of freighters in United States to offset mounting losses from German submarine and air attacks.

## NOVEMBER

1—German invasion ports were bombed again by R.A.F. 2—Italy unleashed violent air attacks on Greek cities and ports, including Athens and Salonika.

3—British landed forces on Greek territory.

4—Spain assumed jurisdiction over Tangier.

Washington received assurances from Marshal Pétain that France would not surrender her fleet to Reich or join war against Britain.

5—President Roosevelt was re-elected for a third term; Democrats increased their control of House of Representatives.

Prime Minister Churchill declared Britain needed air-naval bases on south and west coast of neutral Ireland to fight German submarine and air blockade.

Tokyo published ten-year plan for creation of self-sufficient Japan-China-Manchoukuo economic bloc.

6—Washington reported an agreement among American republics for joint use of their military, naval, and air bases.

Hawaiian Islands voted for statehood in plebiscite.

7—The new suspension bridge over the Narrows at Tacoma, Wash., collapsed due to wind vibration and fell 190 feet into Puget Sound.

Berlin claimed that German naval and air forces sank between 21 and 27 British merchant ships in attacks on two convoys.

8—Five members of Hungarian parliament were charged with conspiracy to kidnap the Regent and establish Nazi regime.

9—President Roosevelt stated that about half of U.S. production of military planes would be released to Britain and Canada.

Former Prime Minister Neville Chamberlain died.

Italian army division was trapped by the Greeks.

"Free French" forces attacked Libreville in French Equatorial Africa.

10—Rumania experienced the worst earthquake in its history.

Mussolini placed Gen. Ubaldo Soddu in charge of campaign in Albania following Italian reverses.

11—The Greeks, aided by British airmen, routed Italians in the Pindus Mountains.

Wendell L. Willkie in radio broadcast urged his supporters to follow constructive policy as "loyal oppositionists" during President Roosevelt's third term.

12—U.S. Government recognized election of Gen. Manuel Avila Camacho as President of Mexico.

Explosions occurred in following plants working on national defense contracts: United Railway Signal Co., Woodbridge, N.J., 9 persons killed, 23 injured; Trojan Powder Co., Allentown, Pa., 3 killed; American Cyanamid Corp., Edinburg, Pa., 3 killed.

An agreement signed in Batavia gave Japan 1,800,000 tons of Netherlands Indies oil annually.

Soviet Premier and Foreign Commissar Molotov conferred with Hitler in Berlin.

13—British torpedo-carrying planes caused heavy damage to Italian warships at Taranto.

14—British reported 762 British, Allied, and neutral ships "lost as a result of enemy action" during first year of war.

15—Dr. Harry A. Mills of the University of Chicago was appointed chairman of the National Labor Relations Board.

Coventry, English industrial city, was devastated in all-night German air raid.

16—American Communist party voted to sever its connections with Communist International to avoid prosecution under the newly enacted Voorhis Act, requiring foreign-controlled organizations to register with the State Department.

20—Birmingham, England, was heavily bombed.

Hungary joined the German-Italo-Japanese alliance. Rumania followed suit on November 23.

21—John L. Lewis resigned as head of the C.I.O. and was succeeded by Philip Murray.

22—Britain would need U.S. financial aid during 1941, the British Ambassador to Washington announced on his return from London.

26—The Rasmack Bill, putting 200,000 employees of emergency Federal agencies under merit system, was signed by President Roosevelt.

27—Rumania's Iron Guard executed 64 former officials of exiled King Carol's government. Disorder spread throughout the country.

29—Explosion in Nelms coal mine near Daciz, Ohio, caused death of 31 men.

30—Germany annexed French province of Lorraine.

Japan signed treaty recognizing Wang Ching-wei's Nanking regime and providing for permanent Japanese military and economic control of North China and Inner Mongolia.

Washington extended an additional \$50,000,000 credit to Chungking Government.

Provisional President Morinigo established dictatorship in Paraguay.

## DECEMBER

1—Joseph P. Kennedy resigned as U.S. Ambassador to Britain.

3—Italian defense line in Albania was broken by Greeks.

5—Motion for peace overtures was rejected by British House of Commons, 341 to 4.

Washington extended government credits totaling \$50,000,000 to Argentina.

6—Marshal Pietro Badoglio, Italian Chief of Staff, resigned.

Porto Edda fell to Greeks.

7—President Roosevelt promised Greece all possible help short of war.

9—Japanese Foreign Minister said Nippon was bound by its alliance to fight United States if the latter attacked Italy and Germany.

British offensive against Italian army in Egypt began.

10—Great Britain declared it could not permit American food to be sent to countries under German domination, but agreed to allow shipments of medical supplies.

Ohlang Kal-shak's Chungking Government received a British loan of £10,000,000.

11—British captured Sidi Barrani and thousands of Italian prisoners.

British Ambassador in Washington said amount of United States aid to Britain would determine outcome of war.

12—Marquess of Lothian died.

14—Marshal Pétain announced the ousting of Vice Premier Laval from Vichy Government.

15—British forced Italians out of Egypt and invaded Libya.

17—President Roosevelt proposed that the United States lend arms and munitions to countries resisting aggression.

18—German land and air forces were reported massing in Italy.

20—President Roosevelt appointed a four-man defense board to speed up arms production.

21—Viscount Halifax, British Foreign Secretary, was appointed Ambassador to Washington.

Anthony Eden became Foreign Secretary in British Cabinet.

23—Prime Minister Churchill appealed to Italians by radio to renounce Mussolini's leadership and end war.

24—Field Marshal von Brauchitsch, German army commander-in-chief, in Christmas broadcast to his troops said that British resistance would soon be broken.

25—Large-scale movements of German troops into Rumania were reported.

26—Registration of nearly 5,000,000 aliens in the United States neared completion.

27—President Roosevelt called 42,000 additional National Guard troops into active service.

After Christmas truce, British and German air raiders renewed attacks.

29—Calling for increased aid to Britain and ruling out proposals for peace negotiations with the Axis powers, President Roosevelt in national radio broadcast charted a course of "dynamic non-belligerency" for the United States.

31—Hitler, in year-end speech to German people, predicted victory in 1941.

**CIVIL AERONAUTICS AUTHORITY (CAA).** See AERONAUTICS.

**CIVILIAN CONSERVATION CORPS (CCC).** During 1940, the Civilian Conservation Corps directed its job training program toward skills closely related to national defense. As virtually all of the work done by CCC enrollees is of the type done in wartime by engineering troops, the quartermaster corps, the front line soldiers, and by workers in industries and agriculture behind the lines, this did not necessitate any major change in the training or the job phases of the CCC program. It did however result in a general overhauling of the training program provided enrollees after work hours. In this program emphasis was placed upon all subjects related to national defense.

The Corps operated a chain of 1500 barrack camps throughout 1940, with a maximum enrollment of 300,000, plus 100 camps on Indian reservations and in Alaska, Hawaii, Puerto Rico, and the Virgin Islands. By legislation the maximum enrollment is 270,000 junior enrollees, aged 17 to 23½, and 30,000 war veterans, all housed in the 1500 barrack camps, 10,000 Indians, and 5000 territorials.

Heading the CCC is the Director, now James J. McEntee, appointed by the President and confirmed by the Senate. The salary is fixed at \$10,000 per year. The War Department is in charge of the administration of the camps. The Departments of the Interior and Agriculture are in charge of the work projects. The Office of the Director handles

the selection of junior enrollees and the Veterans Administration the selection of war veterans.

As a result of the disturbed international situation and the rapid expansion of the Army and Navy, Director McEntee issued instructions early in June for all camp officials to emphasize those phases of the academic and vocational training program which bore most directly on national defense. A 15-minute daily calisthenics drill was initiated for all junior enrollees. Instructions also were issued requiring all enrollees and camp administrative personnel to take the standard 20-hour Red Cross First Aid Course.

Congress recognized the possibilities of the CCC as a training agency for national defense by its adoption of Sec. 38, Public Resolution No. 88, which authorized the President to direct that CCC enrollees be trained in skills most vital to military operations. These skills would include, "... but are not restricted to cooking, baking, first aid to the injured, operation and maintenance of motor vehicles, road and bridge construction, photography, signal communications, and other matters incident to the successful conduct of military and naval activities."

By the end of the calendar year, the CCC had in operation 43 Central Motor Repair Shops, where the trucks, tractors, and other pieces of automotive equipment used by the CCC are repaired. As the shops were placed on an operating basis, enrollees were assigned to them to receive training under the direction of skilled automotive mechanics. It is estimated that between 2000 and 3000 enrollees can receive training at one time in these shops when all of the 63 planned are in operation. An additional 5000 or more enrollees are working in the 1500 camp garages as maintenance mechanics, performing all types of maintenance and repair duties except those which require the precision equipment and heavy hoists available only in the Central Repair Shops.

The 43,000 pieces of automotive equipment used by the Corps require the training annually of approximately 60,000 enrollee-operators. They learn to operate trucks, tractors, bulldozers, draglines, power shovels, road graders, and other heavy machinery which are not far removed from the combat cars, tanks, and military engineering equipment used by the armed forces.

Thirty Cooks and Bakers Schools are now being operated by the CCC to train enrollees to man the 1500 camp kitchens. Because of the demand from private employers and the armed forces for competent cooks and bakers, these schools operate continuously. Enrollees who have had experience as kitchen helpers are assigned to the schools, as well as are junior officers who need experience in mess management. Upon the completion of their course, which ranges from two weeks to two months, they are returned to their camps where they gain further practical training as cooks, bakers, and mess stewards. Approximately 9000 enrollees receive training in these fields at one time.

Schools for the training of subalterns, who serve as second in command of the camps, were being established at the close of the year. Subalterns, as well as camp commanders, formerly were reserve officers serving in a civilian capacity. It is now the intention of the Director to train enrollees to assume these positions. There are two reasons for this: one, because it gives the enrollees an incentive to gain a promotion within the Corps itself, and, two, many of the reserve officers who have served

in CCC camps are now being called for active duty because of the experience they gained in handling CCC camp administrative matters.

Instruction in radio operation and maintenance, both code and voice, is given at many camps. In the west, where camps are well removed from cities and sometimes isolated by weather conditions from contact through telephone and telegraph, the radio has been widely used for reasons of economy and practicability. It also finds a valuable use in fighting forest fires and in rescue operations during floods, hurricanes, and other disasters. In the Fourth Army Corps Area, which embraces the southeastern states, a radio school is conducted at Fort McPherson, Georgia, to provide enrollee-operators for the camp stations. These enrollees are required to pass a standard test which qualifies them for positions not only in the Corps, but with the Army, Navy, Coast Guard, and private radio firms.

Telephone line construction has been one of the important activities of the Corps to provide adequate communications systems in forests and parks as part of their protection systems. The CCC has constructed 80,000 miles of telephone lines.

Photography has been carried on principally as a recreational subject, but it has been enthusiastically accepted by enrollees. Most of the camps have equipped a small darkroom for the development and printing of film.

The Corps has constructed in its nearly eight years of operations 115,000 miles of roads and truck trails and 44,000 bridges. This work has provided a wide range of jobs which are closely akin to military engineering. Approximately 60,000 men received training during 1940 in road construction work, including truck, tractor and jack-hammer operation, map making and reading, surveying, blasting, stone masonry, carpentry, and steel and concrete construction.

Supplementing the training given on the work projects and in camp administrative duties are the courses conducted after working hours in the camp classrooms and shops and nearby schools. Courses range from the "three R's" for illiterates to college and vocational subjects related to the work training. More than 90 per cent of the enrollees participate in organized classes and activities.

Under an order effective Jan. 1, 1941, savings accounts are set up for enrollees in the office of the Chief of Finance, War Department, who acts as fiscal officer for the CCC. Previously \$22 of each enrollee's \$30 a month basic pay was sent to his dependents and the remainder turned over to him to meet personal needs in camp. Under the new arrangement, \$7 each month will be placed in a savings account for him, \$15 will be allotted to his dependents, and \$8 will be given him for personal use. At the conclusion of his enrollment the aggregate of his savings account will be given him in a lump sum to provide a "nest egg" until he is earning in private enterprise.

Another change during the last year opened the CCC rolls to a wider range of applicants. The interpretation of the eligibility requirement, "unemployed and in need of employment," was broadened to include applicants whose families were not necessarily in financial distress. It was held by the Director that many young men coming from families of moderate means could not obtain jobs because they lacked job training and therefore were "unemployed and in need of employment." The necessary job training was available in the CCC

and he felt that it was only fair that they be given the chance to acquire this experience. However, youths from families most in need of the \$15 allotments are given preference in selection.

In connection with the national defense program, the Director of the CCC during 1940 approved the assignment of several CCC companies to work projects on military lands in connection with the expansion of the Army. These projects included construction of a military airplane landing stage at Metlakatla, Alaska, requiring two CCC companies totaling 400 men, clearance of land at Fort Benning, Georgia, and Fort Bragg, North Carolina, for training grounds, and the assignment of one company to the Military Reservation in Okaloosa County, Florida. Other military projects were being proposed as the year came to a close.

From April, 1933, when the Corps was established, to Nov. 30, 1940, the CCC furnished employment to 2,798,207 individuals, of which 2,563,007 were junior and veteran enrollees and the remaining 235,200, non-enrolled personnel charged with the administration of the camps, the work projects, and the general program. Total obligations during that period were \$2,570,000,000, of which \$616,000,000 was allotted to dependents of enrollees.

The conservation work program up to Nov. 30, 1940, included the planting of 1,961,000,000 forest trees, improvement of forest stands on 3,728,000 acres, fire hazard reduction of 2,047,000 acres, expenditure of 5,935,000 man days fighting forest fires, planting of shrubs and grasses for erosion control purposes on 3,611,000,000 square yards, planting of 212,000,000 quick growing trees for erosion control, and construction of 5,570,000 erosion control check dams, 80,000 miles of telephone lines, 115,700 miles of truck trails and minor roads, and 44,500 bridges of all types. Tree and plant disease and pest control operations were carried on over an aggregate of 20,470,000 acres.

JAMES J. McENTEE.

## CIVILIAN PILOT TRAINING PROGRAM. See AERONAUTICS.

**CIVIL SERVICE COMMISSION, U.S.** The unprecedented demands for personnel which have arisen from the national-defense program have been successfully met by the U.S. Civil Service Commission throughout 1940. In normal years only 60,000 to 80,000 appointments are made in the entire classified service, but during the calendar year 1940 over 200,000 placements were made in the War and Navy Departments alone, more than 160,000 of them between June 1 and the first week in November. In August, 1940, the central office of the Commission certified the names of 27,209 eligibles, as compared with 11,166 eligibles in January. Other offices of the Commission experienced similar increases.

Thanks to advance planning which had been done as early as the summer of 1939, the Commission regularly fills the requests of national-defense agencies for personnel within 24 hours after receipt. To do this, it has revived methods which had not been used since the first World War and has devised new ones. Posters stressing the need for personnel in the skilled trades are displayed on bulletin boards in Federal buildings and on mail trucks, and have been reproduced in hundreds of newspapers. Through the generosity of over 800

broadcasting stations which are donating time for this purpose, "spot" notices concerning the need for personnel in certain positions are being read several times daily during breaks for station identification. In addition, the radio industry has arranged several coast-to-coast broadcasts by officials of the Commission on the employment needs of the national-defense program. Consolidated lists of local examinations for which local publicity and recruiting has failed to secure sufficient eligibles are distributed weekly to first-, second-, and third-class post offices, and monthly to fourth-class post offices. A national roster of professionally trained men and women available for specialized defense work is being established, and will be maintained on cards for machine sorting. To make possible the rapid transfer of experienced Government employees to meet emergency needs, the experience and educational background of approximately 600,000 Government employees are being tabulated on punch-cards. Testing procedures are being improved rapidly, faster rating methods have been devised, and arrangements have been made to overcome shortages in certain occupations by resorting to other sources of manpower and by training persons who are potentially qualified. Liaison officers of the Commission have been assigned to many national-defense agencies, with full responsibility for having personnel on the job by the time it is needed.

Nearly all of the defense expansion in the Federal service has come since the delivery of the President's preparedness message in May, 1940. Consequently, detailed statistics on the Commission's national-defense work are not yet available. The figures given below relate, unless otherwise indicated, to the 1940 fiscal year—July 1, 1939, to June 29, 1940—and reflect comparatively little of the expansion which has resulted from the preparedness program.

On June 29, 1940, the classified service included 726,827 positions, or 72.5 per cent of the 1,002,820 positions in the executive civil service on that date. There were 816,610 men and 186,210 women in the executive civil service on June 29, 1940. Within the District of Columbia 39.7 per cent of the employees were women. Outside the District of Columbia 15.3 per cent of the employees were women; this relatively small proportion is caused by the large number of men employed in the Postal Service and in the navy yards, arsenals, and other manufacturing and construction projects.

**Civil-Service Examinations.** During the past fiscal year, 1,052,110 applications for civil-service examinations were received. Ratings were completed and eligible registers established in examinations for which 981,930 persons applied. Of these 846,824 took the examinations, and 381,012 received eligible ratings. The various Federal departments and establishments appointed 68,578 persons from civil-service registers.

Under the act of July 11, 1919, as interpreted by various Executive orders and court decisions, veteran preference is granted all persons discharged under honorable conditions at any time from the Army, Navy, Marine Corps, or Coast Guard. Such preference will be granted to persons inducted into the land or naval forces of the United States under the National Guard Act of Aug. 27, 1940, or the Selective Service and Training Act of Sept. 16, 1940, upon submission of official proof of honorable separation from active military service.

During the fiscal year 1940, 166,340 persons ap-

plied for veteran preference in examinations. Of those who passed civil-service examinations, 47,429 had been granted veteran preference. Of the appointees to the classified service from open competitive entrance examinations during the fiscal year, 20.88 per cent had veteran preference, including 13,686 men and 24 women receiving preference because of their own service, 514 widows of veterans, and 95 wives of disabled veterans.

**Recent Legislation and Executive Orders.** The President approved a number of Executive orders which were recommended to him by the Commission to meet emergency needs of the national-defense program. These emergency needs also affected certain Executive orders of a more permanent character, such as Executive Order No. 8587 of Nov. 7, 1940, which made a number of changes in the civil-service rules. Schedules A and B of the civil-service rules, which are lists of positions exempted from examination or from open competitive examination, were revised by Executive Order No. 8534 of Sept. 6, 1940. Executive Order No. 8576 of Oct. 29, 1940, revised the labor regulations, which govern the appointment of unskilled laborers at a number of Federal establishments such as arsenals and navy yards, and apply to all appointments to unskilled-laborer positions in some cities. Unskilled-laborer positions are not subject to the provisions of the Civil Service Act.

The scope of the Commission's work as the central personnel agency of the Federal Government was extended by the establishment within the Commission, under Executive Order No. 8467 of July 1, 1940, of the Council of Personnel Administration, which had previously been an independent agency. The Council is an interdepartmental committee to deal with personnel matters, and provides machinery for co-ordinating the action of the personnel directors of Federal departments and independent establishments, who are members of the Council.

The act of July 19, 1940, Public, No. 753, 76th Cong., known as the "Second Hatch Act," prohibited "pernicious political activities" on the part of officers and employees of State and municipal agencies whose principal employment is in connection with activities financed in whole or in part by loans or grants made by the United States or by any Federal agency. The United States Civil Service Commission was made an administrative tribunal to pass upon such cases, and a procedure was provided for appeals from its decisions to the courts.

Title I of the "Ramspeck Act" of Nov. 26, 1940, Public, No. 880, 76th Cong., authorized the President to extend the provisions of the Civil Service Act, by Executive order, to all positions previously exempted from it by statute, with the exception of the Tennessee Valley Authority, the Work Projects Administration, assistant United States district attorneys, and persons appointed by the President and confirmed by the Senate. Title II of the act authorized the President to extend the provisions of the Classification Act of 1923, as amended, to positions and employees not at the time subject to its provisions, with certain specified exceptions.

The act of June 29, 1940, Public, No. 680, 76th Cong., extended the provisions of the Alaska Railroad Retirement Act, which it amended, to clerical employees of the Alaska Railroad. The act of June 28, 1940, Public, No. 671, 76th Cong., permits the re-employment in the War and Navy Departments of former employees retired for age under

the act of May 29, 1930, whose re-employment would otherwise be prohibited. This provision is solely in the interest of the recruiting of employees experienced in occupations essential for the national-defense program, and extends in no case beyond June 30, 1942, unless Congress shall otherwise provide.

HARRY B. MITCHELL.

**CLOTHING.** See FASHION EVENTS; GARMENT INDUSTRY; LIVING COSTS AND STANDARDS; SHOE INDUSTRY; TEXTILES.

**COAL AND COKE.** According to the National Coal Association, 1940 output of bituminous coal was 450,000,000 tons. This was more than 50,000,000 tons greater than the production of 1939, and 100,000,000 tons more than that of 1938. It was the best annual production since 1930 when 467,000,000 tons was produced. The dollar value at the mine price was greater than the 1940 combined value of gold, silver, copper, and pig iron.

Fixed prices for bituminous coal at the mines were put into effect October 1, after more than three years of fact-finding investigations by the Bituminous Coal Division of the Department of the Interior.

Electric power generation was still dependent on coal as a source of primary energy, two-thirds of the nation's kilowatt output being produced from coal and one-third from water power.

The accompanying table gives the preliminary estimate of the U. S. Bureau of Mines on production of Pennsylvania anthracite and beehive coke for the year 1940.

**PRODUCTION OF PENNSYLVANIA ANTHRACITE AND BEEHIVE COKE**

	1940 <sup>1</sup>	1939
Anthracite <sup>2</sup> . . . . . (short tons)	50,024,000	51,487,000
Beehive coke . . . . . (short tons)	2,883,500	1,444,300

<sup>1</sup> Preliminary for 1940.

<sup>2</sup> Total production, including colliery fuel, washery and dredge coal, and coal shipped by truck from authorized operations.

New by-product coke ovens built or under construction in 1940 numbered 699, of which 142 replaced some old ovens. This was the largest new construction of coke-making facilities since 1926. Additional construction was in prospect to meet the demand for steel for national defense.

See GENERAL LAND OFFICE; PENNSYLVANIA.

H. C. PARMELEE.

**COAST GUARD, U. S.** A part of the military forces of the United States, operating under the Treasury Department in time of peace and as a part of the Navy in time of war.

The Coast Guard has a personnel averaging for the fiscal year 1941 about 600 commissioned officers, 750 chief warrant and warrant officers, 15,000 enlisted men and 4000 civilian personnel. At present the Coast Guard materiel is composed of a fleet of 267 cutters (consisting of vessels of over 65 feet in length with armaments of 1-pounders, to the largest cutters of 327 feet in length carrying 5-inch broadside batteries); 229 picket boats, 15 auxiliary craft, 30 lightships, and 9 relief lightships. The aviation wing comprises 10 air stations, encircling the coast, and operates 50 planes. The shore establishment includes 197 active Coast Guard lifeboat stations, 47 inactive stations, and 3 houses of refuge. Training facilities include the Coast Guard Academy, 4 training stations for

enlisted men, 4 Maritime Service Training Stations, and the Coast Guard Institute. In addition to these, there are the Coast Guard Depot for the construction and repair of boats and vessels, a communication system consisting of radio stations and some three thousand miles of coastal land wire and submarine cable, administrative offices, stores, and bases. About 2800 small boats are attached to the ships and stations of the Service. All Coast Guard vessels are being equipped on a war time basis.

With a total membership of over 3000 men and with about 2700 boats enrolled and divided into 150 flotillas, the Coast Guard Reserve on October 5 celebrated its first anniversary. Created by act of Congress for the principal purpose of promoting safety at sea through the education of yachtsmen and other small boat operators in the proper handling of their craft, the Coast Guard Reserve movement was instantly accepted by yachtsmen and other owners in possession of small craft. Applications for membership have exceeded the facilities of the Coast Guard and of the various Reserve flotillas, and further expansion has been temporarily retarded to permit of the orderly organization of flotillas and the establishment of an educational program.

In line with the national defense program of the nation, Congress appropriated approximately \$10,700,000 for the needs of the Coast Guard, to be expended in the fiscal year 1941. It is estimated that \$8,200,000 of the total amount requested of Congress will cover the cost of emergency conversion of Coast Guard vessels for Naval use, and of the installation of effective aircraft ordnance. Conversion work involves the revision of armament and ammunition stowage arrangements; installation of guns; enlargement of magazines; fitting of depth charge racks and Y guns; installation of underwater sound detection apparatus; and structural changes incident to these installations. An estimated \$2,500,000 is to be used for pay, allowances, subsistence and equipment of 2500 additional men during the fiscal year 1941. The men would be the first increment of a program to enlist 5000 additional men in the Coast Guard over a period of two years.

A total of 1581 new aids to navigation were established during the past year, consisting largely of daymarks, buoys, and minor lights. In the same period 767 aids were discontinued, leaving a net increase of 815 aids and bringing the total of aids in use to 30,420.

Application of the neutrality laws in the existing international situation has resulted in the Coast Guard establishing its Neutrality Patrol, the duty of which is to prevent any vessel from using United States ports for an unneutral act. Due to the marked decrease and almost total lack of weather data normally furnished the United States Weather Bureau by ships at sea of all nationalities, the Atlantic Weather Patrol was established in February, 1940. Two cutters, equipped as floating weather bureaus, were stationed between the Azores and Bermuda to collect this data. The President's Proclamation of June 27, 1940, gave to the Coast Guard the control of the anchorage and movement of vessels and the supervision of the loading and unloading of explosives and other dangerous cargoes.

In carrying out its functions as the Federal maritime policy agency, the Coast Guard rescued 9249 persons in peril; assisted 32,084 persons on

board vessels; cared for 410 persons in distress; assisted vessels and cargoes valued at \$88,016,268; boarded and examined papers of 39,450 vessels; and seized 21 vessels. The fines and penalties incurred by vessels reported totaled \$235,459. The Coast Guard destroyed 193 derelicts and other obstructions to navigation and recovered property valued at \$82,945. It patrolled 481 regattas and marine parades, and examined 2527 persons for certificates as lifeboatmen.

Other activities of the Coast Guard included: a water-fowl survey for the Biological Survey; transportation of mail where commercial shipping was disrupted; towing vessels of the Maritime Commission; transporting census enumerators to sparsely settled coastal sections of the United States and Alaska; servicing South Pacific Islands for the Department of Interior; co-operating with the Bureau of Fisheries in fishery observations and oceanographic studies in Alaskan waters.

The Coast Guard provided an armed detail to guard approximately 9299 tons of silver bullion valued at \$90,297,200 transported from the Treasury Department in New York to the depository at West Point.

Coast Guard relief forces were dispatched to the aid of communities stricken by the flood of the Susquehanna River during April, 1940, and into southern Alabama during the flood there in August, 1939. Considerable survey work and planning concerning Coast Guard activities in future floods in the Ohio and Mississippi Valleys were undertaken during the past year.

RUSSELL R. WAESCHE.

**COCHIN CHINA.** See FRENCH INDO-CHINA.

**CODLING MOTH.** See ENTOMOLOGY, ECONOMIC.

**COFFEE.** The world coffee crop in 1939-40, according to statistics of the International Institute of Agriculture, totaled 4841 million lb., the least in years except for the small production in 1935-36, and was 91 million lb. below 1938-39, and compared with the 1933-34 to 1937-38 average of 5274 million lb. The season in Brazil was characterized by unfavorable weather conditions from blooming through ripening to drying and in certain areas by crop pests, which continued to reduce volume of production—although conditions in other American countries usually were favorable. Brazilian production approximated 2756 million lb. in 1939-40 compared to 2923 million lb. in 1938-39 from around 8 million acres. Coffee production in other American countries was for Colombia 589 million lb., Venezuela 143 million lb., Guatemala 121 million lb., Salvador 119 million lb., Mexico 110 million lb., Cuba 71 million lb., and Dominican Republic 46 million lb.; and the total for American countries was estimated at 4109 million lb. Netherlands Indies, the leading non-American producer, had a crop of 236 million lb.

The 1940-41 crop of Brazil, as estimated by the New York Coffee and Sugar Exchange, would total about 20,850,000 bags compared to 21,861,000 bags in 1939-40; estimates of world totals in these years were 30,850,000 and 32,361,000 bags.

The Republic of Brazil had pledged 8,628,749 bags against the 1939-40 coffee loan, and had destroyed from July 1, 1939, to Dec. 30, 1940, a total of 4,454,000 bags of coffee. The total destroyed to Oct. 31, 1940, approximated 71,069,000 bags, in addition to 479,000 bags destroyed before June,

1931, by the São Paulo Institute. Exports from Brazil, 1939-40, aggregated 15,553,000 bags, and from Colombia 3,781,864 bags. Coffee delivered in the United States in 1939-40 amounted to 13,886,594 bags. Spot prices in New York in 1940 (Jan.-Dec.) averaged from 5½¢ to 6½¢ per lb. for Santos No. 4 and 6½¢ to 9½¢ for Colombian.

**COFFERDAMS.** See FOUNDATIONS.

**COINS.** See ARCHAEOLOGY. (For value of coins, see INTERNATIONAL BANKING AND FINANCE.)

**COKE.** See COAL AND COKE.

**COLLECTIVE BARGAINING.** See LABOR CONDITIONS; NATIONAL LABOR RELATIONS BOARD.

**COLLEGES.** See UNIVERSITIES AND COLLEGES.

**COLOMBIA.** A South American republic. Capital, Bogotá.

**Area and Population.** Area, estimated at 439,828 square miles; population at the census of July 5, 1938, 8,724,839, of whom 20 per cent were white, 5 per cent Negro, 7 per cent Indian, and about 68 per cent of mixed race. Of 27,437 foreigners in the country in January, 1939, 16.6 per cent were Venezuelans, 13.3 per cent Spaniards, and 8.3 per cent Germans. United States citizens numbered 2191 as of Jan. 1, 1940. The 1938 census populations of the chief cities were: Bogotá, 331,400; Medellín, 170,622; Barranquilla, 152,348; Cali, 110,579; Manizales, 86,346; Cartagena, 86,197; Ibagué, 61,860; Cúcuta, 57,251.

**Defense.** Military training for one year and service in the reserve for nine years is compulsory. The army's peace strength in 1940 was 14,750 men; trained reserves, 100,000; active air force, 1150. Police number about 5000. The navy has 2 modern destroyers, 3 seagoing gunboats, 3 coastal patrol vessels, and 4 river gunboats. The air force has relatively few modern planes. United States military aviation and naval missions were contracted for in 1938 and a French military mission in March, 1940.

**Education and Religion.** About 48.2 per cent of Colombians over 10 years of age were illiterate in 1928 (68 per cent in 1918). Schools, with the number of pupils in parentheses, are as follows: Kindergarten, 293 (12,823); elementary, 8554 (561,948); high, 449 (31,685); colleges and universities, 30 (3548); religious, 31 (1624); special and vocational, 325 (17,036). Roman Catholicism is the dominant religious faith; the Church was disestablished in 1936.

**Production.** The national economy is geared to production of coffee, gold, petroleum, and bananas for export. In 1939 these four products accounted for 95 per cent of the value of all exports. Mineral output in 1939 was: Petroleum, 23,857,000 bbl. (of 42 gal.); gold, 570,017 troy oz.; platinum, 23,671 troy oz.; cement, 167,000 tons; gasoline, 889,000 bbl. Estimated yields of the chief crops were (in metric tons): Coffee, 267,000 in 1939-40; cacao, 11,400 in 1937-38; cane sugar, 41,000 in 1939-40; tobacco, 14,800 in 1937-38; wheat, 90,800 in 1937-38; corn, 490,500 in 1937-38; rice, 74,600 in 1937-38. Manufacturing is confined largely to oil refining and the production of textiles, flour, cigars, cigarettes, etc., for local consumption.

**Foreign Trade.** Exports in 1939 totaled 177,054,000 pesos (163,226,000 in 1938); imports, 183,462,000 (159,259,000 in 1938). The chief 1939 exports by value were: Coffee, 87,125,000 pesos; gold, 40,582,000 pesos; petroleum, 31,903,000 pesos; bananas, 8,679,000 pesos. Cotton cloth, automobiles, iron and steel bars and pipes, pharmaceuticals, and machinery were the leading imports.

The United States supplied 54 per cent of the 1939 imports, Germany 12.8, United Kingdom 9.5. Of the exports, the United States took 66.9 per cent, Curaçao 8.1, Germany 7.3, Canada 7.0. See *TRADE, FOREIGN*.

**Finance.** Ordinary budget receipts in 1939 were 96,095,267 pesos (preliminary), including a surplus of 4,541,419 pesos from 1938, and total ordinary expenditures were 89,331,267 pesos. Total 1940 budget estimates for receipts and expenditures balanced at 91,626,690 pesos (ordinary, 86,107,000; special purposes budget, 2,745,000; budget under Law 12 of 1932, 2,775,000). The national public debt on Dec. 31, 1939, totaled about 200,741,000 pesos (216,873,000 on Dec. 31, 1938). Average exchange rates of the Colombian peso in 1939 were: Controlled, \$0.5714 (\$0.5587 in 1938); curb, \$0.5618 (\$0.5435 in 1938).

**Transportation, etc.** Colombia has slightly over 2000 miles of railway line, 14,700 miles of highways, and a comprehensive network of airways linking all the chief cities. The Magdalena River, on which 849,000 metric tons of freight were carried in 1938, is an important transportation route. The German-controlled SCADTA Airways in 1939 carried 54,621 passengers and 5659 tons of freight. The Pan American Airways west coast route connects at Barranquilla and Cali with the Colombian air network (see *History* for 1940 merger of air lines). Construction of the following railway lines was under way in 1940 or projected with proceeds of the 15,000,000-peso bond issue authorized in 1939: Extension of Nariño Railway and construction of port facilities at Tumaco; completion of the La Virginia-El Pintado and Antioquia sections of Western Trunk Railway; Ibaqué-Armenia line; extension of North Central Railway. A new national radio station was opened at Bogotá early in 1940. Port developments at Santa Marta also were under way in 1940.

**Government.** The Constitution of Aug. 5, 1886, vests executive power in a President elected for four years by direct popular vote and ineligible for re-election for four years after completion of his term. A Congress of two houses exercises the legislative power. The Senate has 56 members, elected for 4 years by departmental assemblies; the Chamber of Deputies, 118 members, elected for 2 years by direct suffrage. Extensive amendments to the Constitution were voted in 1936 (see 1936 YEAR BOOK, p. 174 f.). President in 1940, Dr. Eduardo Santos (Liberal), who assumed office Aug. 7, 1938. In the 1939 elections 77 Liberals and 41 Conservatives were elected to the Chamber of Deputies and 37 Liberals and 19 Conservatives to the Senate.

### HISTORY

Colombia was primarily concerned during 1940 with meeting internal problems that were aggravated by Chancellor Hitler's sensational victories in Europe. One involved Nazi propaganda and military preparations for an attack upon the Panama Canal from Colombian bases. The other was the problem of adjusting Colombia's economy to the drastic fall in coffee prices resulting from the European War.

**The Nazi Threat.** The invasion of European neutrals by Germany, Italy's entrance into the war and the collapse of France aroused further anti-Nazi sentiment in Colombia. There were violent anti-Italian and anti-Nazi demonstrations in Bogotá on June 11, forcing the government to prohibit all demonstrations. Nazi successes in Europe,

however, added new vigor, boldness, and effectiveness to German propaganda and activities. Leaflets attacking the United States and Pan Americanism and promising the return of Panama and the canal to Colombia if she threw in her lot with Germany and Italy were widely distributed. They appeared to have been printed in the Reich and shipped to Colombia on Italian ships. In June Nazi commercial agents offered German manufactures to Colombian merchants at attractive prices, with delivery promised for September. When contracts were made, the Germans were said to have ordered the goods called for in the United States and attempted to conceal its origin.

Although German exports to Colombia had been cut off since the first months of the European War, the German commercial organization was maintained intact, making intensive preparation for the resumption of barter trade when the war was ended. It was closely integrated with efficient propaganda, political and military organizations, all controlled by the leader of the German Nazi party in Colombia and all working in close collaboration with German diplomatic and consular offices.

**Propaganda Inroads.** After the collapse of France, Nazi propaganda was reported to have made rapid progress in winning over many Colombian Conservatives to a pro-German attitude. This was reflected in the changed attitude of some Conservative leaders and newspapers that formerly supported the Liberal policy of close co-operation with the United States. The old resentment over the secession of Panama was stirred up. Conservatives joined in the attacks upon "Yankee imperialism" previously made by Colombian Nazis and Communists. A number of new Nazi and Communist publications were launched that strove to create a breach between the Bogotá and Washington governments. The issue was taken up by the Liberals and became the subject of charges and counter-charges between the leading Liberal and Conservative newspapers.

**Anti-Nazi Precautions.** The Liberal Government took steps to frustrate German plans for using the republic as a base for air attacks upon the Panama Canal. It was announced at Washington March 3 that President Roosevelt during his cruise near the Panama Canal had obtained assurances from Colombia that its air fields would be made available to United States military planes if necessary for defense of the canal against a foreign power.

The elimination of the German local management and the remaining 28 German military pilots and 60 other German technicians holding key positions in the Colombian national airlines company (Avianca) was carried out June 11. Preliminary steps toward this end had been taken on the initiative of President Santos in 1939. United States and Colombian pilots and technicians replaced the Germans. Avianca was thereafter co-operatively owned, managed, and operated by Colombian and United States interests, with Pan American Airways controlling 64 per cent of the stock and the Colombian Government holding a five to ten year option to take over 51 per cent. Pan American Airways undertook to assist in the expansion and re-equipment of the Colombian air lines and to train pilots and technicians for future operation of all Avianca services by a completely Colombian personnel.

By another decree issued in June the govern-

ment established strict control over foreigners residing in Colombia.

**Economic and Financial Measures.** On Dec. 15, 1939, Congress gave President Santos extraordinary powers to deal with the economic and financial crisis arising from the European War. Previous to the expiration of these powers on July 19, 1940, the government issued a series of decrees putting into effect a carefully worked out and comprehensive program for the financial and economic rehabilitation and development of the republic.

The internal public debt was converted at reduced interest rates of 4 and 6 per cent through a 20,000,000-peso loan from the Bank of the Republic. This loan was made possible largely through a \$10,000,000 credit advanced to the Bank of the Republic by the Export-Import Bank of Washington. Co-operation of commercial banks was enlisted in extending agricultural and industrial credits. The state undertook to guarantee loans to individuals and agricultural co-operatives for the development of new crops, such as rubber, quinine, and coconuts. The work of the Ministry of National Economy and the Exchange Control Office was carefully co-ordinated with government trade, credit, and transportation policies and with related private economic interests in order to stimulate farming, stock raising, and manufacturing.

The Institute of Industrial Development was founded with state and private banking capital to promote industrialization. A public works program was adopted calling for completion of existing railway projects (see under *Transportation*), the Tumaco port works, and highways linking roads in the center and south of the country with those of the Atlantic coastal region, on both sides of the Magdalena River. The government undertook to repay most of the debt it owed to the administrative council of the national railways, thus restoring the railways' financial equilibrium and permitting purchase of needed equipment. Another decree provided for conversion of the 1927 and 1928 6-per-cent dollar loans into a new issue of about \$45,000,000 bearing not more than 3 per cent interest.

Among other aspects of this many-sided development plan were such measures as restrictions on rice and wheat imports to encourage home-grown crops; regulation of insurance activities; inauguration of a large public works program in Bogotá in preparation for the Pan American Conference scheduled for 1943; establishment of a national merchant marine, etc. While these measures were in preparation, the government on April 26 granted a temporary export bounty of 1.50 to 2 pesos per sack on coffee shipments to offset drastic price declines. The signing of the inter-American coffee marketing agreement of Nov. 28, 1940 (see *COFFEE*; *PAN AMERICANISM*) led to an improvement in coffee prices and in Colombian economic conditions.

Following a lengthy tie-up of Magdalena River steamers by strikers, the government on October 26 promulgated a law declaring the river services a public utility and prohibiting their suspension through labor troubles. The law authorized the government to establish agricultural colonies or co-operatives to provide work for superfluous laborers engaged in river services.

**Internal Politics.** Although the next presidential election was not due until May, 1942, campaign maneuverings started on July 24, 1940, when

a majority of the Liberal members of Congress agreed to support ex-President Alfonso López as their candidate. The anti-López minority within the Liberal party (see *YEAR BOOK*, 1939, p. 154) retaliated by combining with the Conservatives in the Chamber of Deputies to elect an anti-López president of the Chamber and a Conservative vice-president. The dissenting Liberals also tacitly aided the Conservatives in their attack upon the government's policy of collaboration with the United States.

Although President Santos was leader of the conservative wing of the Liberal party, he denounced the tactics of the minority Liberals. He also charged that the Conservative party's opposition to his request for a large national defense loan was due to the spread of totalitarian ideas in its ranks. Confirmation of this charge was seen in the repudiation of the Conservative leaders by a minority faction of the party in August. This group supported President Santos' policies and accused their leaders of fanatical partisanship. Undismayed by this split in the party ranks, the Conservative leader, Laureano Gómez, on September 26 threatened civil war if Dr. López again became President. He attacked President Santos as an "assassin" and "shielder of criminals." Three days later Gómez received a rebuke from the high command of the army, which invited President Santos to attend a demonstration of loyalty by the cadets of the Military Academy.

After a stormy legislative session that was extended for an additional month by partisan debate, President Santos secured passage of the national defense loan bill, ratification of the inter-American coffee quota agreement, and approval of other important legislation. At the year end he made formal announcement of the government's neutrality in the forthcoming Presidential election and demanded the resignation of all government officials planning to participate in the political campaign.

See *PAN AMERICANISM*; *PAN AMERICAN UNION*.

**COLORADO.** Area, 103,948 square miles, including (1930) water, 290 square miles. Population, Apr. 1, 1940 (census), 1,123,296; 1930, 1,035,791. Population of Denver, the capital (1940), 322,412. The State's urban population (dwelling in places of 2500 or more) rose to 590,756 (1940), from 519,882 (1930).

**Agriculture.** Colorado harvested, in 1940, about 5,559,000 acres of the principal crops; this exceeded 1939's acreage by more than one-tenth and almost equaled the previous ten years' average. Tame hay, on 1,032,000 acres, gave 1,684,000 tons; in approximate value to the farmer, \$12,967,000. Wheat, the chief grain, occupying 1,096,000 acres, made 13,560,000 bu.; value, about \$8,136,000. Of the two great root crops, potatoes, on 78,000 acres, produced 15,210,000 bu. (value, \$7,301,000); sugar beets, on 140,000 acres, 2,304,000 tons (1939's smaller crop was valued at \$7,160,000). Corn, on 888,000 acres, grew 10,656,000 bu. (\$6,394,000); dry beans, 332,000 acres, 1,760,000 100-lb. bags (\$3,929,000); barley, 457,000 acres, 9,368,000 bu. (\$3,841,000); grain sorghums, 500,000 acres—twice the usual area—, 5,000,000 bu. (\$2,000,000); oats, 151,000 acres, 4,530,000 bu. (\$1,495,000).

**Mineral Production.** Colorado's yearly production of native minerals totaled \$60,369,440 for 1938 (U.S. Bureau of Mines' estimate made in 1940). Coal and molybdenum each furnished about

one-fourth of this; gold, over one-fifth; silver, one-twelfth. Coal mines yielded about 5,890,000 net tons for 1939, as against 5,663,144 tons, in value \$14,828,000, for 1938. The mining of molybdenum, after a long rise from small beginnings, declined in production, to 21,796,116 lb. (metal contained in concentrates) for 1939, from 28,242,085 lb. for 1938; the value of these poundages in extracted metal would approximate \$14,570,000 for 1939 and \$19,750,000 for 1938. To the contrary of mines' production, yearly shipments for 1939 exceeded those for 1938. The Climax Molybdenum Company remained the world's chief producer of the metal's ore, the only substantial producer in Colorado, and the chief single mining operation of any sort in the State. Petroleum in relatively small quantity was produced in several fields: in 1939, about 1,391,000 bbl.; in 1938, 1,412,000 bbl. (value, \$1,540,000).

The combined value of recoverable gold, silver, copper, lead, and zinc in mines' yearly production increased to \$24,233,889 for 1940, from \$22,319,041 for 1939. Gold, still the main element in these totals, rose to 368,798 oz. (1940), from 366,852 oz. (1939); by value, to \$12,907,930, from \$12,839,820. Production of silver increased, to 9,559,762 oz. (1940), from 8,496,488 (1939), and to \$6,798,053, from \$5,767,313. Copper totaled 24,592,000 lb. (1940) and 26,430,000 lb. (1939); by value, \$2,778,896 (1940) and \$2,748,720 (1939). The less important yield of lead was valued at \$1,118,900 for 1940, and that of zinc at \$630,110.

**History.** The movement for the payment of old-age pensions at the rate of \$45 a month in Colorado strove by two routes in 1940 toward its goal—to bring into actual effect advantages won, in law but to no great extent in fact when pension-seekers put through the pension amendment to the State constitution in 1936. Litigants obtained from the District Court of Denver two decisions: first, that the pension fund was entitled to 85 per cent of all ad-valorem taxes on stocks of liquor, collected since 1937, whether by State, counties, cities, or school districts; second (January 8), that the pensions must be paid at the full rate and not scaled down, as was the monthly practice of the Board of Social Welfare, in accordance with the money available. The National Annuity League moved to create possibly \$5,000,000 of further revenue by bringing about, through a popular referendum, the taxation of intangible values at the rate of five mills a year on the dollar of valuation. A petition to this effect was circulated for several months, went to the Secretary of State (June 19) with 46,174 names to it, and won a place on the November ballot. The pro-pensioner decisions of the District Court, being appealable, awaited rulings from the higher courts before going into effect. The actual monthly payments of the pensions continued much below the required \$45; in May they averaged \$26.08 and went to about 43,000 recipients. Proposed pro-pensioner amendments to the constitution failed at the polls (see *Elections*, below).

Efforts to establish Colorado's contentions in the long-standing disputes with other interested States over respective shares of the flow of rivers crossing Colorado's borders fell into some confusion. Governor Carr, differing with Attorney General Rogers over how to handle the defense against Wyoming's suit before the U.S. Supreme Court, as to withdrawal of water from the Laramie River, ordered Rogers not to act for Colorado. Rogers ignored the order and presented a brief, while Carr

deputed the task to another attorney. The decision (April 22) while dismissing the actual proceedings against Colorado for contempt of the existing court order limiting the water for use in Colorado, reaffirmed the limit set by that order. Carr was left with the recourse to a direct negotiation with Wyoming for better terms, and this was tried. Inveterate disputes with the downstream States of Nebraska (as to the North Platte) and Kansas (over the Arkansas River) remained at the time unsettled, and the turn of the Wyoming case offered other States some inducement to press their own demands by litigation.

The State Supreme Court ruled, April 9, that two of its former members, who had retired before the enactment in 1939 of a system of pensions applying to this court, could not qualify for the pensions; their previous retirement, it was held, had cost them their pensionable status. In a case of interest to stock-raisers, the court upheld the State's law of 1877 making it lawful to kill dogs chasing or attacking livestock.

One of the most important of public works in the State, the Colorado-Big Thompson undertaking, to divert water from the western slope through the Continental divide, for irrigation on the eastern slope, was advanced by the holing-through of a 13-mile tunnel under the divide (June 23).

**Denver.** The State called on Denver to pay over to it (as constitutionally marked for old-age pensions) \$121,500 of the collections from the municipal fees for liquor licenses; this further pinched the city's income in January. Despite strong objection to more local taxes, licenses to conduct various businesses were made more expensive and other businesses were added to the licensed list. Figures of April 1 showed about one-fifth of the city's population to be receiving support from public aid of the divers sorts. In an effort to put the administration of Denver's civil-service system on a better basis the District Court judges appointed a new member, John J. Cory, to the Civil Service Commission, in place of an ousted member (April 3).

**Elections.** In the popular vote for President on November 5 the State went to Willkie (Rep.), total 279,576, by a narrow margin, the total for Roosevelt (Dem.), 265,554, falling short of that which he had obtained in 1936. Ralph L. Carr (Rep.) was re-elected Governor, defeating George E. Saunders (Dem.). Republicans took two of the four seats in the U.S. House of Representatives, as against none in 1938. The voters rejected four submitted proposals for amendments to the State constitution: one would have replaced the high but uncertain old-age pension with a "guaranteed" pension at \$30 a month, to rank with the State's ordinary expenses as a first charge on the general fund; another would have prevented reduction of the rates of taxation on income and permitted the taxation of intangibles for pension money; a proposed law, also rejected, would have allowed horse racing and a system of betting thereon, under the pari-mutuel system.

**Officers.** Colorado's chief officers, serving in 1940, were: Governor, Ralph L. Carr (Rep.); Lieutenant Governor, John C. Vivian; Secretary of State, George E. Saunders; Auditor, Homer F. Bedford; Treasurer, Charles M. Armstrong; Attorney General, Byron G. Rogers; Superintendent of Public Instruction, Inez Johnson Lewis.

**COMMODITY CREDIT CORPORATION.** A Federal lending institution making loans principally to producers of farm commodities. Such loans are designed to protect and increase farm income, to stabilize farm prices and to assure adequate supplies of farm products. Under its charter, the Corporation is empowered, among other things, to buy and sell, lend upon, or otherwise deal in commodities, agricultural or otherwise. Except for certain legal technicalities attributable to the corporate form of organization, the Corporation operates as a regularly established bureau of the Department of Agriculture under the control and supervision of the Secretary of Agriculture.

The Commodity Credit Corporation has made loans on butter, corn, cotton, dates, figs, mohair, peanuts, pecans, prunes, raisins, rye, tobacco, turpentine and rosin, wheat, and wool. All loans made by the Corporation have been secured by commodities pledged as collateral under either warehouse receipts or chattel mortgages.

Under the provisions of the Agricultural Adjustment Act of 1938 loans are mandatory, under certain conditions, on three commodities; namely, cotton, corn, and wheat. On cotton and wheat the minimum rate of the loan is 52 per cent of parity price and the maximum rate of loan is 75 per cent of parity, but within these limits the rate of loan is discretionary. In the case of corn, the rate of loan is fixed by a statutory formula with a maximum of 75 per cent of parity price.

Commodity Credit Corporation was created as an agency of the United States, under the laws of the State of Delaware, on Oct. 17, 1933, pursuant to Executive Order No. 6340, dated Oct. 16, 1933. It has an authorized and paid in capital of \$100,000,000. Under the act of Mar. 8, 1938, as amended, the Corporation is authorized, with the approval of the Secretary of the Treasury, to issue and have outstanding at any one time, bonds, notes, debentures, and other similar obligations in an aggregate amount of not to exceed \$1,400,000,000.

On Nov. 30, 1940, the Commodity Credit Corpo-

ration reported that it had disbursed since its inception a total of \$1,503,301,803, of which \$635,804,454 was outstanding. Loans held by the Corporation totaled \$289,275,231 and loans held by banks through arrangement with the Corporation totaled \$346,529,105. As a result of its operations the Corporation owned on the above date 6,199,915 bales of cotton, 154,325,327 bu. of corn, and 1,091,231 bu. of wheat. The total disbursements, by commodities, as reported on Nov. 30, 1940, are shown in the accompanying table. See DAIRYING.

CARL B. ROBBINS.

**COMMODITY EXCHANGE ADMINISTRATION.** The agency of the U.S. Department of Agriculture which provides regulation of futures trading in the principal agricultural commodities. The functions of the Administration include the prevention of manipulation of commodity prices on exchanges, the enforcement of limitations on speculative trading, and the elimination of harmful types of trading operations and trade practices. Such regulatory work is designed to strengthen the futures trading system, to the end that futures prices will truly reflect actual conditions of supply and demand, and thus facilitate the orderly marketing of agricultural products.

Originally established under the Grain Futures Act of 1922 as the Grain Futures Administration, the agency became known as the Commodity Exchange Administration in 1936 when Congress amended the original act in many important respects and extended its provisions to cotton, butter, eggs, potatoes, and other commodities. An act of Congress in 1938 added wool tops; and another in 1940, known as the Pace act, added all fats and oils, soybeans, and several other commodities.

The total amount of futures trading in commodities supervised by the Commodity Exchange Administration was estimated at \$10,376,000,000 for the fiscal year ended June 30, 1940. This represented a sharp increase over the amount for the preceding fiscal year which was \$6,715,000,000. However, both figures were far below the \$23,000,000,000 annual average for the 10-year period, 1929-38.

The outbreak of war in Europe tended to upset normal forces of supply and demand, and increased speculative activity in futures trading. Many foreign markets were closed and futures exchanges in the United States became the only world markets not subject to wartime restrictions. To guard against the possibility of manipulation or attempts to depress prices by foreign traders, the Commodity Exchange Administration carefully investigated the transactions of foreigners in both the grain and cotton markets.

In May and June, 1940, the German invasion of the Low Countries and France demoralized grain markets and grain futures prices were temporarily pegged by the exchanges at the request of the Secretary of Agriculture. After panic selling had ceased the pegged prices were lifted by the exchanges. During the last part of 1940 the Administration began the regulation of futures trading in fats and oils, and other commodities, as provided in the Pace act.

To conduct a futures market in any of the specified commodities, an exchange or board of trade must be designated as a "contract market" by the Secretary of Agriculture; and all futures commission merchants and floor brokers operating on these markets must register with the Secretary

Commodity	Dollars
Cotton	775,237,036.09
Cotton Pool	51,415,841.82
Corn	482,863,609.04
Tobacco	14,768,362.50
Turpentine, Rosin	34,550,579.17
Figs	260,061.23
Peanuts	13,437,388.54
Prunes	3,134,748.73
Raisins	5,795,701.34
Wheat	80,719,407.83
Wool, Mohair	3,355,913.00
Butter	34,953,566.03
Dates	61,302.00
Pecans	485,941.63
Hops	1,520,930.85
Rye	658,633.13
Barley	82,780.22

each year. During the fiscal year ended June 30, 1940, a total of 1338 registration certificates were issued.

In addition to the main office in Washington, the Commodity Exchange Administration maintains field offices in Chicago, New York, and five other cities where important commodity exchanges are located.

**COMMONWEALTH FUND.** This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Mr. Edward S. Harkness, President of the Fund from its inception until his death on Jan. 29, 1940, now amounts to approximately \$49,000,000. In 1940 the Fund appropriated some \$2,000,000. Of this total more than two-thirds was devoted to the promotion and maintenance of physical health. Appropriations for needs arising out of the war amounted to \$135,000. Public health activities, designed to raise standards of rural service, centered in Tennessee, Mississippi, Oklahoma, and Alabama. The twelfth in a group of rural community hospitals built or remodeled with aid from the Fund was opened in 1940; two more are under way. These hospitals stress opportunities for professional education as well as standards of medical, nursing, and technical service. Fellowships were offered to instructors in medical schools, without restriction as to field of study, as a means of encouraging able young investigators and strengthening teaching resources; continued aid was given to departments of preventive medicine and psychiatry, to extension teaching and other forms of postgraduate medical education, and to teaching arrangements designed to promote interplay between pediatrics and psychiatry. Some \$450,000 was given for medical research. The Commonwealth Fund Fellowships for British graduate students at American universities were curtailed but not suspended. The Fund continued to aid child guidance enterprises in England; maintained an advisory service for community mental hygiene clinics in the United States; supported studies in administrative law and legal history; and published in 1940 eleven books and pamphlets of educational significance in its fields of operation. The Fund directors for 1940 were Malcolm P. Aldrich (President), Robert A. Lovett (Vice-President and Treasurer), Phil W. Bunnell, Samuel H. Fisher, George Welwood Murray, Dean Sage, and William E. Stevenson. Headquarters are at 41 East 57 Street, New York City.

BARRY C. SMITH.

**COMMUNICATIONS.** See **FEDERAL COMMUNICATIONS COMMISSION**; **RADIO**; **TELEGRAPHY**; **TELEPHONY**; and the countries under *Transportation*.

**COMMUNISM.** The orthodox, or Stalinist, world Communist movement exhibited four main aspects during 1940—expansion of the area and population under direct Communist rule, the progressive revision of Communist ideology and practice in the U.S.S.R., the spread of Communist influence in northwestern China and in parts of the Balkans, and an immense decline in the prestige and strength of the movement throughout the rest of the world.

Of no less importance was the assassination of Leon Trotsky in a Mexico City suburb on August 20. This removed Joseph Stalin's most able critic and principal rival for the leadership of world communism. Both the Mexican police and Trotsky's adherents accused Stalin's secret agents in Mexico and the Mexican Communist party of complicity in the crime. See *NECROLOGY*; *MEXICO under History*.

**Extension of Communist Rule.** The Russian Soviet political and economic system was extended in March into that part of Finland ceded by the Russo-Finnish peace treaty. In June the Baltic States—Estonia, Latvia, and Lithuania—and the Rumanian provinces of Bessarabia and Northern Bukovina were annexed to the Soviet Union. Virtually the entire population of the newly acquired Finnish territory withdrew to what was left of that republic before the Soviet occupation. But relatively few of the anti-Communist elements in the Baltic States, Bessarabia and Northern Bukovina had an opportunity to escape. They were squeezed into the Soviet mould by the same methods of arbitrary confiscation, force and terror applied to opposition groups in Russia since 1917 and to large numbers of Poles after the seizure of Eastern Poland in 1939. See *ESTONIA, FINLAND, LATVIA, LITHUANIA, POLAND, and RUMANIA under History* for details.

This new demonstration of the aims and methods of Russia's Communist regime revived anti-Communist sentiment throughout most of the non-Communist world. It forced many countries in Eastern Europe threatened with Soviet aggression and domination into closer co-operation with Nazi Germany and Fascist Italy (see *BULGARIA, FINLAND, HUNGARY, RUMANIA, SLOVAKIA, and SWEDEN under History*). On the other hand, Russian occupation of the newly annexed territories in Eastern Europe gave many Soviet troops their first contact with the relative economic abundance prevailing in areas retaining the capitalist system. According to neutral observers, this tended to undermine the faith of the Russians in the Soviet system. A similar effect was attributed to the fierce Finnish resistance offered to the Soviet invasion. This discredited Communist propaganda which had induced the Red Army to believe that the Finnish masses would welcome incorporation in the Soviet Union as a means of deliverance from their "capitalist masters."

**Changes in Soviet Union.** The trend toward a more nationalistic form of dictatorship led to the progressive revision of Communist ideology and practice within the Soviet Fatherland. This was reflected in the abolition of Communist political commissars and of "pseudo-democratic" customs in the armed forces, the tightening of labor discipline, the greater powers, privileges, and honors bestowed upon the higher officials of the bureaucracy and Red Army, the abolition of free higher education, and especially in the subordination of Communist doctrine to Russia's national interests in the realm of foreign policy. See *UNION OF SOVIET SOCIALISTIC REPUBLICS under History*.

The annual May Day manifesto of the Comintern predicted the spread of the war in both Europe and Asia, denounced the "Socialist reactionary trade union leaders" who supported the Allied cause, and urged workers in all countries to unite against capitalism and war under the banner of communism. However the main propaganda effort of the international Communist movement was

aimed at "Anglo-American imperialism." In the interests of Stalin's uneasy partnership with Hitler, no effort was made to revive the Comintern's pre-war propaganda offensive against "Fascist aggressors."

This policy aroused bitter criticism both within and without the world Communist movement. In the *New York Times* of June 19, 1940, Leon Trotsky wrote that Stalin's unexpected jump "into the camp of the 'Fascist aggressors'" had "paralyzed the military power of the 'democracies'" and demoralized the popular masses in Europe and elsewhere. The results of these policies, he asserted, were the capitulation of France, the freeing of Germany's mighty army for "a gigantic move toward the East," and the worsening to an extreme degree of the international position of the Soviet Union. The attack upon Finland had revealed the demoralization and weakness of the Red Army to the world. Trotsky concluded that "only the overthrow of the Moscow totalitarian clique" and "the regeneration of Soviet democracy" could protect Russia "against the inevitable and fast-approaching blow of imperialist Germany."

**Communism in China.** Stalinist influence spread in northwestern China due to Gen. Chiang Kai-shek's growing dependence upon Russian aid in his struggle with Japanese militarism. By threatening to cut off war supplies and other aid, Moscow forced the Chungking Government in April to end a minor civil war between Communist and anti-Communist elements in northwestern China in a manner satisfactory to the Chinese Communists. The subsequent closing of the Burma Road by Britain increased Chungking's dependence upon Soviet assistance. These and other circumstances enabled Moscow to strengthen its influence in China and tighten its hold upon Sinkiang and parts of the provinces of Shensi, Kansu, and Ninghsia. See CHINA under *History*.

**Gains in the Balkans.** Similar circumstances enabled the Communist movement to make headway in the Balkans. The German victory over France in June and Italy's entrance into the war left the Balkan countries seemingly at the mercy of the Axis powers. Rumania, forced to choose immediately between Russia and Germany, accepted the role of vassal to the Reich. Bulgaria and Yugoslavia, hoping to stay out of the war and retain their independence as long as possible, sought closer relations with the Soviet Union to counter growing pressure from the Rome-Berlin Axis. This policy obliged them to adopt a more lenient attitude toward Communist propaganda within their own boundaries.

Expertly guided from Moscow, Balkan Communists availed themselves of this opportunity to agitate for still closer co-operation with the Soviet Union. They revived the Pan Slav propaganda that Czarist Russia had used so effectively in strengthening its influence among the Slav peoples of the Balkans. At the same time, they attacked the "imperialist war" between the Allied and Axis powers as responsible for the growing economic hardships of the Balkan countries. A Utopian version of Russian communism was spread among discontented Balkan peasants. This propaganda was reported to be effective among the Balkan masses. The more literate classes regarded the Communist propaganda as a Russian instrument for combating both Axis and Allied influence in the Balkans and preparing the way for a Soviet effort to obtain control of the Straits. See BULGARIA, GREECE,

HUNGARY, RUMANIA, TURKEY, and YUGOSLAVIA under *History*.

**Revulsion against Stalinism.** Throughout the democratic and pro-democratic world, violent hostility to the Stalinist brand of communism, fired by the Hitler-Stalin pact of August, 1939, gained new strength. It was intensified by the Soviet attack upon Finland, the rape of the Baltic States, the seizure by threat and force of Rumanian territories, and the treatment accorded the non-Communist majorities in Poland and in the other newly annexed areas.

An object lesson as to the aims and consequences of Stalinist policies was given in France. The Communist anti-war agitation and sabotage program played an important part in the republic's demoralization and defeat. It helped to produce a French Fascist regime under which Communists suffered more persecution than under the Daladier and Reynaud war governments. In Finland, in Britain and the other Allied countries, and in the non-belligerent democratic and pro-democratic countries, the Stalinists displayed equal readiness to sacrifice their individual and national interests to the interests of the Soviet Union as conceived by Stalin and proclaimed by the Comintern. This not only aroused the contempt and hatred of non-Communists but provoked deep dissensions within the Communist movement itself.

Great Britain remained the only belligerent country in which Communists retained full political rights. A few Communists were detained as suspected "fifth columnists" but the British Communist party's organ, the *Daily Worker*, and its single member of Parliament suffered no official discrimination. In Australia and Canada, however, the Communist parties were outlawed during 1940 and their political activities prohibited. In New Zealand Communists were classified as subversive elements and barred from public services. See AUSTRALIA, CANADA, and GREAT BRITAIN under *History*.

Among democratic non-belligerent countries, Switzerland and Chile passed legislation dissolving their Communist parties. Similar legislation was sought in Sweden, the United States, Cuba, and Mexico. In all countries where Communist political activities were permitted, there were numerous resignations of Communist party members and of "innocents" and "fellow travelers" affiliated with Communist front organizations.

**Schisms in Latin America.** Dissensions within the Communist party organizations and between Communist and democratic elements were particularly acute in Latin America. The Soviet-German pact, Communist-Nazi collaboration in conducting anti-British and anti-American propaganda, and Communist attacks upon the inter-American movement for mutual solidarity and defense all ran counter to the basic democratic principles and objectives of the Latin American masses. Their nationalist sentiments were outraged by Moscow's interference in the internal affairs of the Latin American republics.

These resentments led some Latin American Communists to oppose Moscow's new policies, as relayed from the New York office of the Comintern, at an inter-American conference of Communist leaders held in Santiago, Chile, in October. The Stalinists brought the Latin American party organizations into line only by ousting many influential members and introducing factional struggles in many branches of the party. See BRAZIL,

CHILE, COSTA RICA, CUBA, and MEXICO under *History*.

**Communism in United States.** The American reaction to the Hitler-Stalin pact and the ensuing switch of Soviet foreign policy was tested indirectly by a poll taken by the American Institute of Public Opinion early in January, 1940. The question whether it was more important for the Dies Committee to investigate Communist or Nazi activities in the United States was put to a cross-section of voters in all walks of life. Of those expressing opinions, 70 per cent believed an investigation of Communist activities was more important. The Institute pointed out that a similar poll taken less than a year before indicated that the American people were at that time more concerned with Nazi than with Communist activities.

Another of the Institute's polls, taken early in October during the Presidential campaign, revealed further evidence of widespread anti-Communist sentiment. Of persons expressing opinions, 71 per cent opposed allowing the Communist party's candidate the same amount of time on the radio as the Democratic and Republican Presidential candidates, while 63 per cent did not believe the Communist candidate should be allowed any time on the radio. The Institute pointed out that the public's attitude toward the Communist party was conditioned by the widespread belief that it was "just a tool of Russia."

**Dies Committee Findings.** This belief was deepened by two additional reports on Communist activities in the United States, issued by the Dies Committee on January 3 and November 28, respectively, and by supplementary revelations made at various hearings of the Committee during the year. In its January report to Congress, the Committee asserted that the American Communist party was the primary instrument of the Russian Communist party in protecting the interests of the Stalin dictatorship. The November report, describing Communist plans for sabotaging American industry in the event of war, contained data which the Committee set forth as proof of "the Communist party's supreme loyalty to the Soviet Union." See DIES COMMITTEE.

**Communist Party Activities.** The public activities of the American Communist party were another source of mounting anti-Communist sentiment. To many Americans, these activities fully confirmed the Dies Committee charge that orthodox communism in the United States was following a program dictated in Moscow with Russian rather than American interests in mind.

The American Communist party's national convention in New York City at the beginning of June adopted a platform conforming in every respect to the new party line adopted by the Comintern following the Nazi-Soviet pact. It opposed the rearmament program of the Roosevelt administration and any American intervention in Latin America, China, or the Netherlands East Indies, while endorsing the "peace policy of the Soviet Union." Other planks called for better pay and working conditions for labor, pensions of \$60 a month for all persons over 60 years of age, additional social legislation, expansion of the Federal youth and farm aid programs.

The convention unanimously re-elected William Z. Foster and Earl Browder as national chairman and general secretary, respectively. Browder and James W. Ford, Negro, were nominated as the party's candidates for President and Vice-Presi-

dent. Browder conducted his campaign while at liberty on appeal from his conviction for passport fraud, carrying a four-year Federal prison sentence. Forbidden to leave the jurisdiction of the Federal District Court of Southern New York, he was obliged to campaign with phonograph records in other States. However he was able to present his case to the public by radio under the Federal Radio Law requiring broadcasting companies to give all qualified political parties equal facilities. During the campaign Browder and his associates stressed a demand for an alliance of the United States, the Soviet Union, and China as a "people's peace movement." Ruled off the ballot in 24 States, the Communist candidate received only 48,789 votes as against 80,159 in 1936 and 102,991 in 1932.

**Federal Anti-Communist Measures.** Meanwhile the growing anti-Communist trend of popular sentiment was reflected in a series of laws and measures designed to expose and curb Communist activities. A Federal jury in New York City on January 22 convicted Earl Browder of using a United States passport obtained by making a false statement. He was immediately sentenced to four years in prison and a \$2000 fine, but was given his liberty on a \$7500 bond pending appeal.

Clarence A. Hathaway, editor of the Communist party organ, the *Daily Worker*, was convicted of criminal libel by New York County jury on May 3, 1940. He was sentenced to 30 days in the workhouse and fined \$500. A similar fine was imposed on the Comprodaily Publishing Company, publisher at the time the libel was committed. The complaint was made by Mrs. Edith Liggett, widow of a Minneapolis, Minn., editor. The effort to secure the deportation of Harry Bridges, Australian-born leader of West Coast maritime workers, on the ground that he was a Communist was ended when Secretary of Labor Perkins on January 8 cancelled the deportation proceedings. This action was based on the finding of James M. Landis, dean of the Harvard Law School, that the government had failed to prove that Bridges was a member of the Communist party. J. Edgar Hoover, chief of the Federal Bureau of Investigation, on December 16 issued a report stating the Bridges was a Communist and that the party advocated overthrow of the United States Government.

The Department of Justice early in the year conducted an investigation of the Communist party and its organ that led to the registration of the *Daily Worker* with the State Department in April, under the law requiring registration of agents of foreign principals. This was followed late in July by the sale of the *Daily Worker* to three women sympathetic to the Communist cause and the announcement that it had ceased to function as "the official central organ of the Communist party." However it was stated that the paper would receive the party's "whole-hearted, continued, and ever-extending support."

On November 16 a special national convention of the Communist party in New York City voted to terminate its affiliation with the Communist International and all other foreign organizations "for the specific purpose of removing (the party) from the terms of the so-called Voorhis Act." This law, signed by President Roosevelt in October and effective Jan. 1, 1941, required foreign-controlled organizations engaging in political activity to register with the Attorney General, report the names and addresses of all persons contributing or paying dues, and file detailed reports on their activi-

ties. The constitution of the party was revised in line with the special convention's decision, but the delegates reaffirmed the "unshakable adherence of our party to the principles of proletarian internationalism of Marx, Engels, Lenin, and Stalin." Asserting that the Voorhis Act was aimed directly at the Communist party, Browder declared that the party had decided to sever its formal tie to the Communist International to prevent it from being driven underground.

Congress also tightened the naturalization laws so as to make it harder for Communists, Fascists, and other anti-democratic elements to obtain citizenship. The 1940 Relief Appropriations Act barred Communists and Nazis from the WPA rolls. On January 2 Attorney General Murphy accused 8 persons and 3 business houses, all with alleged Communist party connections, with military espionage. The charges were submitted to an extraordinary grand jury in Washington. In November and December, charges that Communists were responsible for initiating and prolonging strikes in airplane and other defense industries provoked numerous demands in Congress for further restrictive legislation.

**Action by States.** Many of the State governments also enacted laws or regulations curbing or penalizing Communist activities. In the 1936 Presidential campaign Earl Browder, the party's Presidential candidate, appeared on the ballot in 35 States. In 1940 he was permitted to appear on the ballot in only 24 States. The principal grounds given for barring Communist candidates in 1940 were fraud or misrepresentation in the party's election petitions, failure to poll sufficient votes in prior elections, and the party's advocacy of the overthrow of the American form of government. The Dies Committee on September 26 reported that its investigation of Communist party petitions in 10 States had revealed evidence of fraud in every case.

The Communist candidate for Governor of West Virginia was convicted on August 6 of fraudulent solicitation of names to a nominating petition. He was sentenced to 1 to 10 years in prison. On October 8 the wife of the secretary of the Maryland Communist party was convicted of perjury in connection with the circulation of nominating petitions. In cases where Communist candidates were barred, however, their supporters retained the customary right of writing in their names. Browder received 10,206 write-in votes in New York State.

In Oklahoma the drastic State Criminal Syndicalism Act of 1919, prohibiting membership in any organization advocating overthrow of the government by violence, was revived. Under this law the secretary of the State's Communist party, Alan Shaw, was convicted on December 9 by an Oklahoma City jury. The jury recommended and the court imposed a sentence of 10 years in prison and a fine of \$5000 for party membership. Shaw was one of 12 persons arrested on August 20 on criminal syndicalism charges. He was freed on \$7500 bail pending appeal.

**Communism and Labor.** The struggle between Communist and anti-Communist forces also had wide repercussions within the labor movement. The American Labor party, which made its appearance in New York State in the 1936 campaign, was split wide open in 1940 by the struggle for control between the pro-Communist left wing and the anti-Communist right wing. In the Sep-

tember primaries the right wing captured a majority of the delegates to the State convention while the left wing won control of the party machinery in Manhattan. The State convention subsequently adopted a platform attacking the left-wing faction as "tools of the Communist-Nazi alliance."

In scores of labor unions and civic organizations the issue of Communist influence or control caused heated controversy and not a few schisms. The demand for ousting Communists from the labor movement was voiced by Secretary of Labor Perkins on June 4. American Federation of Labor unions conducted an active drive to expel Communist influences. Many local unions amended their constitutions to bar Communists, Nazis, Fascists, and their sympathizers from either membership or official positions, and this position was supported by most of the State and national leaders of the Federation. See AMERICAN FEDERATION OF LABOR.

Similar efforts to oust Communists and their "fellow-travelers" from positions of control in some of the newly organized C.I.O. unions met with less success. The Dies Committee report of January 3 asserted that Communist leadership was entrenched in the following C.I.O. unions: National Maritime Union, United Cannery, Packing and Allied Workers, Federation of Architects, Engineers, Chemists and Technicians, Fur Workers International Union, International Longshoremen's and Warehousemen's Union, Transport Workers Union, United Office and Professional Workers Union, American Communications Association, United Electrical, Radio and Mechanical Workers of America, United Furniture Workers of America. The leaders of these unions for the most part supported policies identical with the Communist party line during the Presidential campaign and at the C.I.O. national convention in November. See CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOR CONDITIONS.

Other unions torn by controversy over Communist influence during the year were the American Federation of Teachers, the American Newspaper Guild, and the Workers Alliance of America. David Lasser, president of the latter organization, resigned on June 19 in protest against Communist domination and control. On August 14 he started a new movement of unemployed WPA workers and others.

The third national Negro conference held in Washington in April split on the issue of Communist intervention in the struggle of the Negroes for equality of opportunity. The American Civil Liberties Union in February barred from office or committee membership both Communists and Fascists and their sympathizers. Turmoil continued in the American Youth Congress, which at its "citizenship institute" in Washington in February and at its annual convention in College Camp, Wis., in July, again demonstrated its adherence to the Communist party line. There were further secessions of non-Communist youth groups from the Youth Congress, and in August a rival organization of "pro-American groups," the National Foundation for American Youth, was founded under the chairmanship of Gene Tunney. A similar schism took place within the American Artists Congress when the Congress on April 4 endorsed the Soviet invasion of Finland and declared Britain and France responsible for the European War.

Many of the organizations under Communist

domination participated in an "emergency peace mobilization" in Chicago on August 31-September 2. Senator Nye of North Dakota, Senator Clark of Missouri, and a number of other prominent figures who accepted invitations to address the conference withdrew when charges were made that the sponsoring Committee to Defend America by Keeping out of War was "Communist inspired and controlled from end to end."

See also ARIZONA, ARKANSAS, CALIFORNIA under *History*; BELGIUM, BRITISH MALAYA, FINLAND, and SLOVAKIA under *History*; DIES COMMITTEE; EDUCATION; FASCISM; LABOR CONDITIONS.

**COMMUNITY CHESTS AND COUNCILS, Inc.** A membership association of community chests and councils of social agencies, organized in February, 1918, as the American Association for Community Organization. For organization and purpose see the 1939 YEAR BOOK.

Of the 552 chests and councils in operation, 536 are in continental United States, 2 in the territory of Hawaii, 1 in the Virgin Islands, 11 in Canada, and 2 in foreign countries. All but five cities of 100,000 population and over in the United States have community chests. More than 9,000,000 contributors in 552 cities gave \$86,186,466 to community chests to be used for private social work in their communities during 1940.

The officers in 1940-41 were: Honorary president, George E. Vincent, Greenwich, Conn.; president, Robert Cutler, Boston, Mass.; vice-presidents, John Stewart Bryan, Richmond, Va., and Kenneth Sturges, Cleveland; treasurer, J. Herbert Case, Plainfield, N.J.; secretary, Lynn Mowat, Los Angeles, Calif.

**COMMUNITY SERVICE FOR CHILDREN.** See JUVENILE DELINQUENCY.

**COMMUNITY TRUSTS.** The charitable resources of the 76 Community Trusts established in the United States, Canada, and Hawaii since 1914 increased by upwards of \$4,000,000 during 1939 and totaled approximately \$52,000,000 at the beginning of 1940. These philanthropic trusts were created to provide a mechanism for the administration of multiple funds dedicated to charitable uses. Customarily the donor of a fund selects a bank or trust company as trustee and lodges in it responsibility for the custody and fiscal management of the contributed sum.

Outpayments of distributable proceeds are directed by a central Distribution Committee, a portion of whose members are nominated by such public sources as the presidents of the Bar Association, Chamber of Commerce, and Academy of Medicine. This Committee is responsible for the observance of the desires of the founders of the funds but is empowered to take remedial action if the execution of these desires should be rendered impossible or impracticable by changes in social or economic conditions—thus constituting an effort, in the words of the late Newton D. Baker, "to substitute contemporary wisdom for foresight." The placement of fiscal power in the trustee and sociological authority in the Distribution Committee provides, in the opinion of Col. Leonard P. Ayres, "a business control of the investments and a social control of expenditures."

At the beginning of 1940, the Chicago Community Trust held principal funds aggregating \$9,734,331, and the New York Community Trust had resources of \$8,779,225. The Cleveland Foundation's resources were \$6,100,761. Other sizable accumulations were held by foundations in Bos-

ton, Winnipeg, Indianapolis, and Minneapolis. Combined disbursements in 1939 exceeded \$1,000,000 for the ninth consecutive year, aggregating \$1,277,927. The New York Community Trust disbursed \$205,028, Boston \$181,874, Cleveland \$163,321, and Chicago \$159,640. Fifty-four individual funds constitute The New York Community Trust, organized in 1923 and located at 120 Broadway, New York City. Its outpayments of over \$1,000,000 during the past five years have been the largest made by any Community Trust.

**CONCILIATION SERVICE, U.S.** Congress, in creating the Department of Labor, gave the Secretary of Labor authority to mediate or conciliate labor disputes. This function was carried on in the Secretary's office until 1917 when a Division of Conciliation was established.

The activities of the Service for the fiscal year ended June 30, 1940, embraced work in 46 States, the District of Columbia, and Alaska. It rendered service in 3751 situations involving directly 1,145,205 workers. Of the total number of situations, 1977 were classified as labor disputes which included strikes, threatened strikes, lockouts, and controversies. These accounted for 1,015,540 workers. The remaining 1774 situations involving 129,665 workers were classified as other services rendered and included arbitrations, conducting consent elections, technical services, supplying information, consultations with employees or employers, and complaints.

The most significant work of the Service was in the prevention of threatened strikes, these being defined as situations in which a definite commitment has been made with regard to a strike. Because Commissioners of Conciliation were made available in 322 of these situations, the Service prevented approximately 300 of them from developing into actual strikes. These involved over 194,000 workers and if computed on the basis of Bureau of Labor Statistics man days lost by strikes, would reveal a potential saving of 3,882,900 man days of work and wages.

Of the total situations handled during the fiscal year, over 700 were terminated on the basis of signed agreements. This indicates clearly the establishment of better relationships between labor and management, and further, that they are finding it more advantageous to reduce their agreements in collective bargaining to written instruments. Eighteen major provisions were included in these signed agreements—the most important having reference to hours of labor, wages, overtime, grievance procedure, and union recognition. Under the grievance procedure it is revealed in numerous instances that either an arbiter is to be designated by the Conciliation Service or that a conciliator shall be called in before there is an actual stoppage of work.

There has been a marked interest on the part of both labor and management in the work of the Conciliation Service—in numerous instances this Agency has been called upon to explain to labor as well as to managerial groups, its functions, and all seem especially interested in the fact that it has no

law to enforce. Commissioners of Conciliation—acting as interpreters of principles, clarifying issues, and making suggestions for shortcuts based on practical experience as to methods, practices, and procedure—have aided materially in establishing more satisfactory relationships between employee and employer.

All this work has assumed even greater importance under the defense program. The adaptation of the Conciliation Service to emergency conditions may be summarized as: (1) Designation by the Secretary of Labor of seven of the Service's most experienced Commissioners of Conciliation to work in constant touch with labor and management in seven of the key defense industries; (2) The practice of giving every priority to situations affecting defense; (3) The closest possible co-operation with the National Defense Advisory Commission and with the Departments of War and Navy on government contracts. The U.S. Conciliation Service has been designated a defense agency by the U.S. Civil Service Commission.

During the calendar year 1940 the Conciliation Service participated in 4665 situations involving 1,709,348 workers.

J. R. STEELMAN.

**CONGO, Belgian.** A Belgian colony in central Africa. Area, 902,082 square miles; population (Jan. 1, 1939), 10,304,084 natives and 25,200 whites. The language spoken by the natives is Kiswahili. Chief towns: Léopoldville (capital), Matadi, Elizabethville, Jadotville, Stanleyville, and Coquilhatville. Education (1939): 228,101 students in 4295 schools.

**Production and Trade.** The chief agricultural products comprise palm and palm-kernel oil, cotton, coffee, copal gum, cacao, sugar, maize, rubber, groundnuts, timber, and bananas. Copper (120,000 metric tons exported in 1939), diamonds, gold, silver, tin, manganese, radium, uranium, cobalt, and iron are the principal minerals. Cattle raising is successfully carried on in districts free from tsetse flies. Trade, with Belgo-Luxemburg Economic Union only (1939): Imports, 370,800,000 francs; exports, 1,622,400,000 francs (franc averaged \$0.3328 for 1939).

**Communications.** The river Congo and its tributaries form an important means of transport to the interior. On Jan. 1, 1939, there were 43,923 miles of roads, 3051 miles of railways, 4209 miles of telegraph lines, and 4000 miles of telephone lines. During 1938 the railways carried 274,800 passengers and 4,187,921 metric tons of freight. The interior airplane services of the Belgian Congo are operated over 4757 miles of routes.

**Government.** Budget estimates (1940): 747,208,000 francs for revenue and 779,822,000 francs for expenditure. The preliminary 1939 figures indicate actual revenue of 675,453,000 francs and expenditure of 730,780,000 francs. The administration is under the control of the Belgian minister for the colonies, aided by a colonial council of which he is president. The Belgian government is represented in the colony by a governor-general (aided by a vice-governor-general, state inspectors, and six provincial commissioners). Governor-General, Pierre Ryckmans (appointed December, 1934).

**Ruanda-Urundi.** Two districts mandated to Belgium by the League of Nations. Area, 21,230 square miles; population (Jan. 1, 1939), 3,752,742. Capital, Usumbura. The chief products are maize,

cotton, potatoes, groundnuts, tin, and gold. Live-stock raising is an important occupation. Trade (1938): Imports, 83,963,498 francs; exports, 93,860,221 francs. Finance (1939): Revenue, 45,165,000 francs; expenditure, 42,158,400 francs. The public debt on Dec. 31, 1938, was 150,000,000 francs. Both districts were united, for administrative purposes and placed under the supervision of a vice-governor.

**History.** The future of the Belgian Congo was linked to the outcome of the European War when Germany invaded Belgium on May 10, 1940. When King Leopold surrendered, the refugee Belgian cabinet in Paris on May 28 informed the Governor-General of the colony that he was to ignore the King's action as Belgium was still at war. At the same time the British Government gave assurances of its support of the Belgian administration in the colony as long as Belgium's elected representatives functioned as British allies. In a broadcast from Elizabethville on July 22 Governor-General Ryckmans declared that the Belgian Congo was determined to stand by Britain until victory was achieved and Belgium liberated.

Anglo-Belgian co-operation in Africa became progressively closer as the war progressed, especially in the economic field. On May 31 the Belgian Congo government ordered the sale to it of all gold produced in the colony and its delivery to the South African Reserve Bank at Pretoria. In June the Belgian Congo franc was pegged to sterling at 176.625 to the pound. The Governor-General announced in September that a British military and economic mission had arrived at Léopoldville to help organize the colony's defenses and to mobilize its economic and financial resources in the Allied cause. British aid was extended in supplying essential imports and providing markets for exports formerly sent to Belgium. A consequence of this collaboration was the extension of the colony's air network to Entebbe in Uganda and Takoradi in the Gold Coast. This provided rapid communication with the British West and East African colonies, the Cape-to-Cairo trunk air route, and Egypt.

Belgian Congo authorities also granted refuge to French colonial citizens and officials from French Equatorial Africa who were sympathetic to General de Gaulle's movement. This aid enabled the Free French forces to win control of French Equatorial Africa at the end of August and ended the immediate threat of the seizure of the Belgian Congo by Germans operating from Equatorial Africa on the north and Angola on the south. A large number of German agents were said to have been concentrated in Angola for this purpose.

See BELGIUM, FRENCH EQUATORIAL AFRICA, and GREAT BRITAIN under *History*.

**CONGO, French.** See FRENCH EQUATORIAL AFRICA.

**CONGREGATIONAL CHRISTIAN CHURCHES.** The General Council of the. A general council was instituted at Seattle, Wash., June 27, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The International Congregational Council to have been held at Wellesley, Mass., July, 1940, has been indefinitely postponed because of war conditions. The General Council's biennial meeting at Hanover, N.H., June, 1942. For the officers elected at

the last biennium, see the YEAR BOOK for 1939.

The headquarters of the General Council of the Congregational Christian Churches are at 287 Fourth Avenue, New York City, those of the Board of Home Missions at the same address, with offices also at 14 Beacon St., Boston, Mass., and those of the American Board at 14 Beacon St., Boston, Mass. For statistics, see RELIGIOUS ORGANIZATIONS.

**CONGRESS OF INDUSTRIAL ORGANIZATIONS.** Substantial organizational advances of the Congress of Industrial Organizations in 1940 were reflected in a succession of Labor Board election victories in most of the basic industries, and in many new and renewed collective bargaining agreements with the country's biggest industrial employers.

The third constitutional convention of the C.I.O., was held in Atlantic City, N.J., from November 18 to November 22. At this convention, Pres. John L. Lewis and Vice-Pres. Sidney Hillman declined to run for re-election, and the following officers were elected: President, Philip Murray; Secretary, James B. Carey; Vice-Presidents, Joseph Curran, S. H. Dalrymple, Emil Rieve, Reid Robinson, Frank Rosenblum, and R. J. Thomas.

The report of retiring Pres. John L. Lewis to the 1940 convention noted that C.I.O. unions during the year received 60 per cent of all the votes cast in Labor Board elections and three times as many votes as were cast for unions of the American Federation of Labor. It continued:

"The General Motors election, the largest Labor Board election ever held, was won overwhelmingly by the C.I.O. United Automobile Workers of America, as were elections in nearly all the other major automobile plants.

"The United Electrical, Radio and Machine Workers of America is another C.I.O. union which has won election after election in the past year in the great plants of General Electric, Westinghouse, RCA, and other companies.

"The Packinghouse Workers Organizing Committee can also record an almost unbroken record of election victories in the plants of Armour and the other big meat packing companies.

"These are but a few examples of the many election successes of C.I.O. unions in industry after industry. Through their votes the workers have registered their emphatic preference for the modern industrial form of organization which the C.I.O. was formed to promote.

"New and improved contracts in the steel, automobile, electrical, packing, glass, and scores of other industries have testified to the solidity and permanence of the new C.I.O. unions and their ability to raise the wages and improve the conditions of the workers.

"The C.I.O. has also pushed ahead into new territory during the past year, as witness the progress of the United Construction Workers Organizing Committee and the advances into unorganized territory of many other already established unions.

"Noteworthy among the new organizing campaigns launched during the past year are the campaign to organize the employees of the Ford Motor Company, the expanding drive in the aircraft industry, the campaign to complete organization in the steel industry, notably in the plants of Bethlehem steel and other independents, and the organizing drive among the wood workers of the northwest."

On the legislative field, the report noted that during the year "the C.I.O. has had to devote most of its energies to preserving existing labor and social legislation against vicious attacks. Its outstanding achievement in the past year has been the preservation of the National Labor Relations Act against determined efforts to force through destructive amendments. Amendments designed to destroy the Wage-Hour law were also defeated, due chiefly to the efforts of the C.I.O.

"Other important legislative actions of the C.I.O. have included defense of American civil liberties against the flood of anti-alien, anti-labor, and generally restrictive bills that usually accompany a period of war hysteria."

The report also stressed the efforts of the C.I.O. during the year to obtain Congressional action or a Presidential executive order to require observance of the National Labor Relations Act and other labor laws on government contract work.

The attitude of the C.I.O. toward the question of national defense was expressed in a declaration adopted at the Organization's executive board meeting in Washington on June 4, 1940, and this position was later reaffirmed at the Atlantic City convention. The declaration follows in full:

"The Congress of Industrial Organizations, its officers, constituent unions, and membership are fully prepared to discharge our responsibilities in the approaching national emergency, to the best interests of the United States of America.

"At the outset let us state most unequivocally that we are, and always shall be, unalterably opposed to any movement or activity of subversive character, Trojan horses, or fifth columns, which are aimed against our nation and government, or the basic free and democratic institutions upon which our Republic has been founded.

"The Congress of Industrial Organizations is the labor movement in our first line of defense—the mass producing industries of mines, mills, factories, and workshops. By the strength and discipline of our organizations, the affiliates of the Congress of Industrial Organizations have substituted industrial peace and stability for industrial warfare, in these first lines of defense.

"We are prepared to lend practical, wholesome, and feasible co-operation in any undertaking to protect this nation and prepare for national defense.

"The ideals and objectives of the Congress of Industrial Organizations are an essential part of national policy. They are inherent in our democratic society. They are predicated upon the maintenance and preservation of labor's rights, so clearly set forth in the Constitution of the United States; in Congressional statutes, and in Supreme Court decisions validating such statutes.

"Throughout any national emergency, labor's rights, as embodied in the National Labor Relations Act, the Wage and Hour Act, the Walsh-Healey Act, the Guffey Coal Stabilization Act, the Social Security Act, and other legislation must be preserved.

"These rights are:

- "1. The right of wage earners to organize into unions of their own choosing.
- "2. The right of organized wage earners to bargain collectively with their employers.
- "3. The right of wage earners to freedom of speech, assembly, action, and worship.

"This declaration of labor's rights is designed to stabilize industrial relations and promote industrial peace. It does not contemplate industrial strife. It seeks to improve the relationship between wage earners and their employers; to increase the productive efficiency of industry; to maintain labor's existing wage and hour standards, and to improve these standards with changing economic conditions.

"Any national defense program must contemplate this kind of co-operation.

"It is imperative for the national welfare that steps be taken to end unemployment.

"It is recognized that large numbers of idle workers will be re-employed through the impetus given our economy by the present situation. But it must also be recognized that industry generally, especially the mass producing industries, is capable of turning out maximum production with a much smaller working force than ever before, due to tremendous strides in technology.

"This means that large numbers of able-bodied and willing workers will not find places in private employment; and sight must not be lost of the necessity of providing for them.

"And after the current war-stimulated recovery has run its course, what then?

"When war orders stop, as stop they will, millions who will have been employed in the armament and related industries will be cast out of their jobs. For them, their families, and for millions of others like them, provision must be made, lest misery and suffering, the like of which no civilized country has seen before, trail in the wake of 'war boom' dislocations.

"Our industrial unions constitute a great reservoir of productive, technical, and administrative skill and resourcefulness. The brains of labor should be utilized to

serve the nation in its national defense undertaking. Organized labor must be given adequate representation on boards, agencies, administrative bodies, and policy-making groups concerned with the execution and administration of any national defense program.

"Finally, we the executive board of the Congress of Industrial Organizations, meeting this 4th day of June, 1940, in the nation's capital, declare in unequivocal terms that we will defend the free institutions of this Republic, under which the Declaration of Independence and the Constitution give us the greatest democracy on earth—a government of the people, for the people, and by the people.

"We offer this program in a sincere endeavor to make our contribution toward achieving the goal which is in the heart of every true American—to assure the security of our nation, to preserve the peace for our people, and not to become involved in the present horrible war raging in Europe."

Among important resolutions adopted at the Atlantic City convention were:

1. A resolution calling for the protection of labor in the administration of the conscription law. This called for labor being given an active voice in the administration of the draft law and for "equal treatment without discrimination." Safeguards were demanded against discrimination because of union activity and attempts "to break down and destroy union standards through repressive means"; reinstatement of workers without loss of seniority or other rights upon completion of their service; continuation of benefits under the Social Security laws; adequate housing and sanitation facilities; protection of the civil rights of conscripted men; and provisions against foreclosures, evictions, and lapsing of insurance policies were among the points stressed in this resolution.

2. A resolution against "foreign entanglements which may in any way drag us down the path of entering or becoming involved in foreign wars."

This resolution reiterated the support of the C.I.O. for national defense and its determination "to protect and defend this nation not only against our foreign enemies who may dare to attack us directly but also against those forces within our nation who place the profits of their financial and industrial enterprises above the well-being of the millions of common people."

3. A resolution calling for guarantees of collective bargaining in government contracts, loans, and purchases.

4. A statement reaffirming the Americanism of the C.I.O. and its opposition to "any policies emanating from totalitarianism, dictatorships, and foreign ideologies such as Nazism, Communism, or Fascism."

The main objects of the Congress of Industrial Organizations, as outlined in its constitution were reaffirmed at the 1940 convention as follows:

"First. To bring about the effective organization of the working men and women of America regardless of race, creed, color, or nationality, and to unite them for common action into labor unions for their mutual aid and protection.

"Second. To extend the benefits of collective bargaining and to secure for the workers means to establish peaceful relations with their employers, by forming labor unions capable of dealing with modern aggregates of industry and finance.

"Third. To maintain determined adherence to obligations and responsibilities under collective bargaining and wage agreements.

"Fourth. To secure legislation safeguarding the economic security and social welfare of the workers of America, to protect and extend our democratic institutions and civil rights and liberties, and thus to perpetuate the cherished traditions of our democracy."

The 1940 convention of the C.I.O. also adopted a resolution rededicating the C.I.O. to "its primary purpose of organizing workers into modern industrial unions as the surest guarantee that the power of labor will reach its full estate."

The C.I.O. movement started with a membership of less than 1,000,000. It was able to report a membership of approximately 4,000,000 to its third constitutional convention in 1940, with 42 national and international unions and organizing committees affiliated. In addition, the C.I.O. has affiliated to it 225 state, county, and city Industrial Union Councils and 419 Local Industrial Unions. Headquarters are at 1106 Connecticut Avenue, N.W., Washington, D.C.

The following is the list of national and international unions affiliated to the C.I.O.:

Aluminum Workers of America  
Architects, Engineers, Chemists and Technicians, Federation of  
Automobile Workers of America, United  
Cannery, Agricultural, Packing and Allied Workers, United  
Clothing Workers of America, Amalgamated  
Communications Association, American  
Die Casting Workers, National Association of  
Electrical, Radio and Machine Workers of America, United  
Federal Workers of America, United  
Fishermen and Allied Workers of America, International Union of  
Fur and Leather Workers Union, International  
Furniture Workers of America, United  
Glass, Ceramics, and Silica Sand Workers, Federation of  
Inlandboatmen's Union of the Pacific  
Iron, Steel and Tin Workers, Amalgamated Association of  
Longshoremen's and Warehousemen's Union, International  
Marine Engineers' Beneficial Association, National  
Marine Cooks' and Stewards' Association, National  
Marine and Shipbuilding Workers of America, Industrial Union of  
Maritime Union of America, National  
Mine, Mill and Smelter Workers, International Union of  
Mine Workers of America, United  
Newspaper Guild, American  
Office and Professional Workers of America, United  
Oil Workers International Union  
Paper, Novelty and Toy Workers International Union, United  
Stone and Allied Products Workers of America, United  
Retail, Wholesale, and Department Store Employees of America, United  
Rubber Workers of America, United  
Shoe Workers of America, United  
State, County and Municipal Workers of America  
Textile Workers Union of America  
Transport Workers Union of America  
Woodworkers of America, International

Following is the list of C.I.O. organizing committees:

Barbers and Beauty Culturists of America, Natl. Organizing Comm. of  
Construction Workers Organizing Committee, United  
Department Store Workers Organizing Committee  
Distillery Workers Organizing Committee  
Farm Equipment Workers Organizing Committee  
Packinghouse Workers Organizing Committee  
Steel Workers Organizing Committee  
Utility Workers Organizing Committee

See COMMUNISM; LABOR CONDITIONS.

PHILIP MURRAY.

**CONNECTICUT.** Area, 4965 square miles, including (1930) water, 145 square miles. Population, Apr. 1, 1940 (census), 1,709,242; 1930, 1,606,903. Cities (1940): Hartford, the capital, 166,267; New Haven, 160,605; Bridgeport, 147,121; Waterbury, 99,314; New Britain, 68,685. The rural population, increasing nearly thrice as much as the urban, attained 551,080 (1940).

**Agriculture.** Connecticut harvested, in 1940,

about 450,300 acres of the principal crops. Tame hay accounted for some three-fourths of this area, or 348,000 acres; these yielded 484,000 tons; in estimated value, \$7,889,000. Tobacco, under intensive cultivation on only 17,400 acres, produced 22,996,000 lb., in value, about \$7,135,000, or fairly close to that of hay. Potatoes, 18,900 acres, gave 3,402,000 bu. (\$2,449,000); corn, 49,000 acres, 1,960,000 bu. (\$1,509,000); apples, 1,210,000 bu. (\$1,331,000). Farms: 21,163 in 1940 (17,195 in 1939).

**Manufacturing.** Yearly production of manufactured goods in Connecticut totaled \$1,229,615,773 for 1939; \$1,261,788,693 for 1937. Other totals for 1939 (each with that for 1937 subjoined): 2936 (2892) manufacturing establishments employed 233,525 (262,620) persons for wages of \$276,274,243 (\$312,269,732), paid for materials, etc., and contract work \$537,399,081 (\$581,001,594), and added to value of material, by process of manufacture, \$692,216,692 (\$680,787,099).

**History.** Plans for over \$50,000,000 in Federal works to check the ravages of floods in New England, including Connecticut, were still in the Army engineers' hands for revision in the spring of 1940. Additional protection for Hartford and East Hartford was under consideration. The continued enterprise of improving the State's highways was advanced by a program calling for the expenditure, by the Highway Department, of about \$10,000,000 during the year. Plans called for developing the southwestern and northeastern ends of the Wilbur Cross Parkway (extension of the Merritt Parkway); its middle part was not yet to be constructed, but improvements instead were provided for U.S. 5 between Meriden and Hartford. The State undertook the preliminaries to constructing a new highway bridge over the Thames River at New London. The last-completed section of the Merritt Parkway, that from Nichols through Stratford and over the Housatonic River, was opened on September 2. The noted stone-arch bridge over the Middlebury-Naugatuck road was removed in November as an accident-trap.

Connecticut's conviction of Newton Cantwell, of the sect of Jehovah's Witnesses, for soliciting funds in New Haven without the required license, was reversed (May 20) by the U.S. Supreme Court, on the ground of infringement of religious liberty. The State's Supreme Court of Errors sustained (March 20) Connecticut's law prohibiting measures against conception, in cases against the Waterbury Maternal Health Center and against physicians, rejecting as a defense the need of such measures for a patient's health. (See BIRTH CONTROL.) Two bankers of Waterbury and Bridgeport, directors of McKesson and Robbins when that company was wrecked by the operations of the late F. Donald Coster, alias Musica, were tried in the Federal District Court in New York, with other defendants, for conspiracy in Musica's huge illicit operations; the two were acquitted; seven other defendants formerly connected with the big Connecticut company pleaded guilty or were convicted (May 18).

The manufacturing of a variety of goods made in the State was stimulated by demand on account of war abroad and of defensive preparations in the United States. A striking example was that of Pratt and Whitney (part of the United Aircraft Corporation) at Hartford; this firm built in 1939-40, partly with British money, great additions to its works and multiplied its monthly output of aircraft engines tenfold.

**Elections.** In the general election (November 7) Roosevelt, for President, carried the State getting 417,621 votes to 361,819 for Willkie (Rep.); the total vote of both major parties' Presidential candidates exceeded that of 1936 by about 119,000, or over one-sixth, the Republican total increasing by about 83,000 and the Democratic by about 36,000. Francis T. Maloney (Dem.) was re-elected United States Senator, defeating Paul L. Cornell (Rep.). Robert A. Hurley (Dem.) was elected Governor, defeating Raymond E. Baldwin (Rep.), who sought re-election. Six Democrats won the State's seats in the House of Representatives, four of them sweeping out Republicans.

**Officers.** Connecticut's chief officers, serving in 1940, were: Governor, Raymond E. Baldwin (Rep.); Lieutenant Governor, James L. McConaughy; Secretary of State, Sara B. Crawford; Treasurer, Joseph E. Talbot; Comptroller, Fred R. Zeller; Attorney General, Francis A. Pallotti; Commissioner of Education, Alonzo G. Grace.

**CONSCIENTIOUS OBJECTORS.** See DRAFT, MILITARY.

**CONSCRIPTION.** See AUSTRALIA, CANADA, ECUADOR, MEXICO, and NEW ZEALAND under *History*. For conscription in the United States, see DRAFT, MILITARY and the topics there referred to.

**CONSERVATION WORK.** See AGRICULTURAL ADJUSTMENT ADMINISTRATION; CIVILIAN CONSERVATION CORPS; EDUCATION, OFFICE OF; FORESTRY; GENERAL LAND OFFICE; LAND UTILIZATION, OFFICE OF; NATIONAL RESOURCES PLANNING BOARD; PLANNING; SOIL CONSERVATION SERVICE.

**CONSTRUCTION INDUSTRY.** The vast importance of the construction industry in the progress and welfare of the United States is not generally recognized. But it caused a total expenditure of approximately seven billion dollars in 1939, including residential building and all public and private engineering construction. With a natural increase and the "emergency" conditions created by the foreign war and the call for defensive activities at home, this total rose to eight and one-half billion dollars in 1940. Of this great total, nearly half was in engineering construction, according to a review by *Engineering News-Record* which showed \$2,824,989,000 for public works construction and \$1,162,254,000 for private construction, or a grand total of \$3,987,243,000.

ENGINEERING CONSTRUCTION: 1940

Type of Construction	Million dollars	% increase or decrease
Public buildings, including Federal industrial plants (\$300-million) and defense housing	1,196	+102
Highways and streets	678	+ 5
Industrial buildings	595	+110
Commercial buildings	400	+ 3
Earthwork, irrigation and drainage	234	+ 1
Bridges	120	- 20
Sewers and sewage treatment plants	91	- 43
Water works and treatment plants	70	- 57
Unclassified: airports, air bases, shipyards, etc.	603	+ 54
Total	3,987	+ 33

These two first totals were respectively 34 and 31 per cent above those of 1939, while the grand total was an increase of 33 per cent. Of the public works construction, \$1,451,726,000 was for Federal work. In the accompanying table is given a summary of the engineering construction, showing for each class the total expenditure and its in-

crease or decrease as compared with 1939. These figures are exclusive of innumerable minor engineering works and residential and miscellaneous construction, which go to make up the construction total of 8½-billion dollars. The first census of the construction industry was taken in 1940 by the U.S. Bureau of the Census, to record the activities in 1939 in each State and in many large cities. It summarized the reports of general contractors and some 25 classes of sub-contractors. Day-labor work was not included. See separate articles on the branches of the industry, as BRIDGES, BUILDING, WATERWORKS, AND WATER PURIFICATION; also, BUSINESS REVIEW.

E. E. RUSSELL TRATMAN.

**CONSUMER EDUCATION, Institute for.** In 1937 the Institute for Consumer Education was established at Stephens College, Columbia, Mo. It is a project of the Alfred P. Sloan Foundation which is "devoted to the increase and diffusion of economic knowledge." In accord with this purpose, the Institute aims to aid consumers to solve the problems which affect their well-being.

Director of the Institute is Dr. John M. Cassels, formerly of the economics staff of Harvard University. Its Educational Director is Dr. James E. Mendenhall, from the research staff of the Lincoln School of Teachers College, Columbia University.

At present, the Institute for Consumer Education has two main fields of work. As a Division of Stephens College, it endeavors to give young women the skills, knowledge, and attitudes which will make better managers of their personal resources, as students and as future homemakers. It also aims to assist these young people to gain a better understanding of the economic system in order that they become more effective consumer-citizens. As a national agency, the Institute works to serve the growing number of teachers and leaders who are interested in developing improved programs in this vital area of education.

The Institute carries on economic research which appears in the form of scientific monographs and popular booklets on consumer topics. It conducts surveys of what high schools and colleges are doing in the field, and makes the results available to the educational public. It co-operates not only with school people but also with leaders of adult groups which are including consumption either as a major or a minor field of study and activity. A monthly news letter (October to June) is published by the Institute.

Annually, the Institute holds a national conference. This conference has been attended by more than 600 teachers and others concerned with raising the quality and effectiveness of consumer education.

**CONSUMER GOODS.** See BUSINESS REVIEW.

**CONSUMER GROUPS.** See CO-OPERATIVE MOVEMENT; LIVING COSTS AND STANDARDS; and the consumer organizations listed under SOCIETIES AND ASSOCIATIONS.

**CONSUMER PROTECTION.** See NATIONAL DEFENSE ADVISORY COMMISSION.

**CONTAINERS.** See FOOD AND DRUG ADMINISTRATION; GLASS.

**CONTRACT BRIDGE.** The contribution of contract bridge to the science of domestic discord was lessened somewhat in 1940 as a result of a campaign by the American Contract Bridge League to substitute better manners, courtesy, and equanimity for the natural primitive instinct of the human animal as exemplified in card games. This and the gradual emergence of new stars were the highlights of the past season.

Following in condensed form are the results of the outstanding contests of 1940:

*Eastern championship*—Goldman pairs, M. D. Maier and Charles Lochridge.

*Master's individual*—Morris Ellis.

*Vanderbilt cup matches*—Harold S. Vanderbilt, Baron Waldemar von Zedtwitz, Edward Hymes Jr., Robert McPherran, and Charles Lochridge.

*Summer nationals, Asbury Park*—Women's pairs, Mrs. John Waidlich, Rosemont, Pa., and Mrs. Edith W. Atkinson, Wayne, Pa.; men's pairs, M. D. Maier and Robert McPherran; mixed teams, Mrs. Marie Black, Baron Waldemar von Zedtwitz, Mrs. Olive Peterson, Philadelphia, and Henry Chanin, Atlanta, master's pairs, Morris Ellis and Harry J. Fishbein; master's teams, Alvin L. Roth, Washington; Oscar J. Brotman, Washington; Sam Katz, Newark, and Bertram Lebar, New Rochelle.

*Winter nationals*—Women's team of four, Mrs. Adelaide Neuwirth, Mrs. Lottie Zetoch, Mrs. Helen Levy, Jersey City, and Mrs. Humphrey Wagar, Atlanta; mixed pairs, Mrs. Ralph C. Young, Philadelphia, and Sidney Silodor, Philadelphia; open team of four, Morris J. Glick, Cleveland, Harry Feinberg, Cleveland; Louis Newman, Washington, and Jeff Glick, Miami, open pairs, Mrs. A. M. Sobel and Charles H. Goren, Philadelphia.

**CONTRACTS.** See LAW under *Private Law*.

**CONVICT LABOR.** See PRISONS, PAROLE, AND CRIME.

**CO-OPERATIVE MOVEMENT.** Consumer co-operatives haven't gone into the face-lifting business. But in 1940 "face-lifting" got into the co-operatives. From Washington, D.C., to Schenectady, N.Y., from Cambridge, Mass., to the Messabi iron range in Minnesota and Berkeley, Calif., co-ops moved from side streets, around the corner to Main Street. Smart, "kitchen clean" fixtures in self-service food stores placed cheek-to-jowl with chains and super-markets gave evidence of a determination on the part of independent, locally-owned consumer stores to meet and better the record of the mammoth chains. In every instance the physical modernization of co-op stores brought in new members, increased business, and cut operating costs.

The score of co-op shops that had their faces lifted in 1940 will be followed by a hundred this coming year and "modernization" is expected to push forward rapidly until the thousand co-operative grocery stores now in operation become the outstanding shops in their communities. Central Co-op Wholesale, Superior, Wis., serving two hundred stores in northern Minnesota, Wisconsin, and Michigan, has established an architecture department to plan and supervise store modernization. Midland Cooperative Wholesale, Minneapolis, and its grocery co-ops in southern Minnesota and Wisconsin have adopted simple, uniform store front and layout keyed to "Swedish modern." Consumer Distribution Corporation, founded by the late Edward A. Filene, working with Eastern Co-op Wholesale, Brooklyn, has taken the leadership in the modernization program among the 200 grocery co-ops in twelve Eastern States.

Co-op testing kitchens in Brooklyn and Superior check the quality of merchandise handled by the co-operatives—giving for the first time consumer control of quality. Uniform CO-OP labels have been introduced in all co-ops affiliated with National Cooperatives, Inc., the national buying federation. And in the last two years, the co-operatives have pioneered in the introduction of government ABC grade labelling of food products.

Contrary to the general impression, co-op gro-

cery stores are only part—a relatively small part—of the consumer co-operative movement. These consumer-owned enterprises, operated democratically according to Rochdale principles (named after the original consumer co-operative opened in Rochdale, England, in 1844) take in almost every phase of economic life. Farm supply depots, co-op gas and oil associations, co-operative insurance companies, electric distribution co-ops, telephone associations, housing, health, and restaurant co-operatives, student co-op dormitories, eating clubs, and bookstores, credit unions, and burial societies make up the American consumer co-operative movement as we know it today. Because operations are so all-inclusive, many of its members look on co-operation as a way of life, or point to it as the nucleus of an economic system that follows the "middle way" between the extremes of communism and fascism. Two million American consumers were, at the end of 1940, doing a total business estimated at \$600,000,000 a year. In addition, there were 2,250,000 members of co-op credit unions (loaning and borrowing associations sometimes referred to as "baby banks") which have accumulated assets of over \$200,000,000.

Farm supply purchasing is the largest single factor in consumer co-operative business. During the 1939-40 fiscal year these co-ops handled \$448,000,000 worth of supplies according to statistics just released by the Farm Credit Administration. This represented an increase of \$23,000,000 over the previous year.

Co-operatives have broken the hold of the "fertilizer ring" and have emerged as "trust-busters" in a field vitally important to the American farmer. By building fertilizer factories, the co-ops forced down the price of commercial fertilizer four dollars a ton, saving farmers in Ohio alone more than a million dollars last year.

Petroleum products distributed by 2000 gas and oil co-ops last year amounted to nearly \$100,000,000. In less than 20 years co-operatives have moved from retail oil distribution all the way back to refining and drilling and operating oil wells. In 1940 three oil refineries were opened—in Phillipsburg, Kans.; Mt. Vernon, Ind., and Regina, Saskatchewan. Ninety-two miles of pipe line were built by the Consumers Cooperative Association to connect the Kansas co-op refinery with nearby wells. The co-ops thwarted an attempt on the part of a major oil company to cut off their source of crude oil—and as a protective measure to provide an assured source of supply, the first co-op oil wells in the world were drilled and started production late in 1940.

Insurance is an essentially co-operative undertaking and many mutual companies are co-operative in several respects but not part of the consumer co-operative movement. For that reason the 2000 farmers' mutual fire insurance organizations with three million members and eleven billion dollars worth of insurance in force are not included in the statistics stated above. There are, however, a number of insurance co-operatives handling automobile, fire, and life insurance. Notable in this field is the Farm Bureau Cooperative Insurance Services, which started with assets of \$10,000 in 1926 and last year had a \$10,000,000 premium income providing auto, fire, and life insurance to 380,000 consumer members in eleven States.

Electric power co-operatives received their greatest impetus with the creation of the Rural Electrification Administration in 1935. Only 50

electric co-ops were in existence at that time. By April, 1940, a total of 548 such co-ops were operating 198,000 energized miles of line serving 483,000 rural families. Ninety-two per cent of the loans made by the REA were handled by co-operatives which have carried on a lion's share of the job of bringing electric light and power to rural America.

Co-operative burial associations received widespread publicity a few years ago when the then attorney general of Minnesota ruled that a consumer co-operative must be made up of ultimate consumers. Since the ultimate consumer of a burial co-operative would be a dead person, he contended that such associations were illegal. By the time the ruling was reversed several additional communities had decided to set up burial co-ops to help cut the cost of dying. Forty co-op burial societies are now serving 31,000 members in five mid-western States. A U.S. Bureau of Labor Statistics study completed in 1940 showed that the average cost of a funeral in a co-op was \$166 as compared with \$363 for the average private-profit mortuary.

On 160 American campuses more than 200 student co-ops are helping over 100,000 students make their way through college by cutting the costs of food and lodging, books, laundry, cleaning, and medical service. Federations of campus co-ops have been set up on the Pacific Coast, in the Plains States, and in the mid-west. A National Committee on Student Cooperatives acts as a clearing house for information on the organization of student co-ops.

Other co-operatives include housing, health, and restaurant service, which reported gains during the year. New housing units were completed in Minneapolis, St. Paul, Madison (Wisconsin), and in Nova Scotia, while at the close of the year the largest housing co-op in New York City—the Amalgamated Cooperative Apartments housing 630 families in the Van Cortlandt Park area—voted the fourth expansion since it was founded in 1927. A dozen co-operative health associations are in operation. Outstanding, of course, is the Cooperative Hospital in Elk City, Okla. Other noteworthy health services have their headquarters in Washington, D.C., Greenbelt, Md., New York City, St. Louis, Superior, Wis., and St. Paul. The 21-year-old chain of co-op cafeterias, Consumers Cooperative Services, in New York City, still leads the field. Its eight recently modernized eating spots served a million meals last year.

There is a growing awareness of the importance of co-operation between co-operatives. Most of the important co-operatives are federated into a national educational organization, The Cooperative League of the USA, which on Mar. 18, 1941, celebrates its 25th year of active education. Twenty regional and national associations of co-operatives with 1,115,000 patron-members are affiliated with The Cooperative League. Through its offices in Chicago, New York, and Washington, the League is responsible for the national education, organization, publication, publicity, research, and contact work of the movement.

Paralleling The Cooperative League and including most of its members is National Cooperatives, Inc., the purchasing federation of co-operatives. Organized in 1933 and maintaining offices with the League in Chicago, National Cooperatives co-ordinates the purchasing of its member associations where economies can be made by large-scale purchases. It also serves as a clearing house for technical information, holds and polices the CO-OP

label and is responsible for uniform standards of excellence of products distributed under the CO-OP label.

**European Co-operatives.** Co-operatives in Europe have been seriously affected by the war. Even before hostilities were declared, the powerful co-operative movements in Austria and Czecho-Slovakia were destroyed or taken over by the Nazis. The Polish co-operatives have been very severely hit. It is too early yet to have complete reports on Denmark, Norway, Belgium, Holland, and France. We must assume, however, that the fate of the co-operatives there will be similar to the fate of the co-operatives in Germany itself.

Prior to the Nazi Regime, the German co-operative movement was looked upon as one of the strongest in the world. Its 3,644,000 members did a retail business of RM1,095,000,000 in 1932. But with the ascendancy of totalitarianism, Nazi officials were put in charge of co-operatives, democracy was ruled out, surplus funds were diverted to the Nazi war chest through the purchase of government bonds, and under Nazi administration co-operatives were dissolved as rapidly as was feasible.

The co-operatives in Sweden are still a dramatic example of co-operative accomplishment. They handle 20 per cent of the retail business of the country; they have broken flour milling, rubber, margarine, and electric lamp bulb trusts and have pioneered in efficient retail distribution. Since the outbreak of the European war, the Swedish co-operatives have served as a yardstick to keep prices from rising as a result of unjust profiteering.

The British co-operatives have been growing rapidly since the declaration of war although they are severely hampered by war-time restrictions which are forced on all business and by the loss of many of their workers who are in the armed services. About 8,500,000 British consumers are members of the co-operatives. Total co-operative retail business in 1939 was \$1,500,000,000. The co-operatives had become the largest single distributive business in Britain.

International trade between co-operatives has been so severely hit by the war that the International Cooperative Trading Agency has suspended operations temporarily, but the International Co-operative Alliance, the educational organization with members in 39 countries, is carrying on.

WALLACE J. CAMPBELL.

**COPPER.** The full impact of the European war and the national defense program of the United States did not strike the mineral industries until about the fourth quarter of 1940. By that time, however, the domestic copper mining industry was operating almost at capacity (considering the price of the metal), and arrangements had been made to import a large tonnage from Latin America.

The price of the metal was fairly stable throughout the year, and particularly in the fourth quarter after the Defense Commission had announced its intention to prevent unwarranted price

rises in commodities. Opening the year at 13¢ per lb., the price declined to a low of 10.5¢ in July and rose gradually to 12¢ in September, where it remained until the year end. The average price for the year was 11.296¢, f.o.b., refinery, according to *Engineering and Mining Journal*, compared with 10.965¢ for 1939.

No price was quoted in London during 1940, because trading was suspended on the London Metal Exchange, and the Ministry of Supply fixed the price at which consumers could obtain copper.

The Census of Manufacturers, 1939, revealed some interesting facts about primary smelting and refining of copper in comparison with conditions in 1937. The number of establishments was the same in each year, 23. Moderate decreases were noted, however, in employment, wages, and production. Salaried personnel in 1939 numbered 1783, a decrease of 6.7 per cent compared with 1937. Number of wage earners decreased from 14,514 in 1937 to 12,234 in 1939, or 15.7 per cent. Wages were correspondingly down from \$20,941,462 to \$17,443,834. Value of products was down from \$715,354,577 to \$633,994,537.

In December, 1940, the Metals Reserve Company, a subsidiary of the Reconstruction Finance Corporation (q.v.), contracted to buy for the Government 100,000 tons of copper from Latin America during 1941. The price for 72,000 tons was 10¢ per lb, f.a.s. New York, on the condition that if at any time the cost of freight and insurance exceed ½¢ per lb., such excess will be borne by the Metals Reserve Company. The price for the remaining 28,000 tons was 9½¢ per lb., f.a.s. Chilean ports, on the condition that for such portion of this copper as the sellers can furnish transportation, the Metals Reserve Company will allow ½¢ per lb. for transportation, war, and marine insurance.

According to the U.S. Bureau of Mines smelter and refinery output of copper from domestic ores in 1940 were at the highest levels since 1929, surpassing the record for 1937 by 10 to 15 per cent. United States imports of unfabricated copper were larger than in any other year since 1929, due to war disturbance. Exports were a little higher than in 1939, and the largest recorded since 1929. Japan was the principal buyer.

The Copper Institute reported the following summary of statistics for 1940.

#### U.S. DUTY-FREE COPPER

	1940	1939
<b>Production</b>		
Crude*..... (short tons)	992,095	836,074
Refined..... " "	1,033,710	818,289
<b>Deliveries</b>		
Domestic..... (short tons)	1,001,886	814,407
Export..... " "	48,537	134,152
Total..... " "	1,050,423	948,559
<b>Refined Stocks</b>		
End of period..... (short tons)	142,772	159,485

\* Mine or smelter production or shipments and custom intake, including scrap.

Estimated smelter production in 1940 from domestic ores was 1,814,000,000 lb., an increase of 27 per cent over the output of 1939. The output of new, refined copper from domestic and foreign sources in 1940 amounted to 2,616,000,000 lb., an increase of 30 per cent over 1939. The production of secondary copper was 232,000,000 lb., about the same as in 1939. Total primary and secondary output was 2,848,000,000 lb., 26 per cent larger than in the preceding year.

In 1940, according to the Bureau of Foreign and Domestic Commerce, copper imports amounted to 729,994,264 lb., valued at \$73,492,234; exports, 855,-887,957 lb., valued at \$110,118,658.

H. C. PARMELEE.

**COPTS.** See under EGYPT and ITALIAN EAST AFRICA.

**COPYRIGHT.** Registrations for the fiscal year 1939-40, according to the report of the U.S. Register of Copyrights, numbered 176,997, as compared with 173,135 for the preceding year. Of these 110,715 were classed as books, but included pamphlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 107,252, those printed abroad in a foreign language, 2502, while the remainder, 958, were English books registered for ad interim copyright. The chief classes of the remaining registration were: Periodicals (numbers), 80,356; musical compositions, 46,152; dramatic or dramatico-musical compositions, 7052; works of art, models, or designs, 4014; drawings or plastic works of a scientific or technical character, 3931; photographs, 4403; prints and pictorial illustrations, 7136; maps, 3242; lectures, sermons, addresses, 1277; motion pictures not photoplays, 1533; motion-picture photoplays, 1583; reproductions of works of art, 647. The renewals numbered 10,207 as compared with 10,177 in the preceding year. The fees applied during the year amounted to \$320,082. The total number of separate articles deposited during the fiscal year ended June 30, 1940, was 272,041. The gross receipts of the Register's office for the fiscal year were \$341,061, the total expenditures for salaries, \$274,285, and for supplies, \$2340. See PATENT OFFICE, U.S.

**CORN.** The corn crop of the United States in 1940 was estimated by the U.S. Department of Agriculture at 2,449,200,000 bu., 6 per cent smaller than the 1939 crop of 2,602,133,000 bu. and compared with the 1929-38 (including three drought years) average of 2,299,342,000 bu. The total acreage harvested for all purposes was 86,449,000 acres compared with 88,430,000 acres in 1939, 13 per cent below the 10-year average of 98,986,000 acres, and was the smallest acreage since 1894. Yield per harvested acre averaged 28.3 bu. versus 29.4 bu. in 1939, the highest since 1920, and compared with the 10-year average of 23.2 bu. Increased acreages of high-yielding hybrids and more extensive use of high-speed power machinery kept the yields above average in spite of severe drought damage in Illinois, Indiana, and Ohio. Corn harvested for grain was estimated at 2,170,902,000 bu., the 4,443,000 acres harvested for silage produced 32,359,000 tons of silage, and the remainder of the crop, about 5,648,000 acres, was harvested for forage or grazed by livestock. The states leading in production of corn for grain were: Iowa 437,580,000 bu., Illinois 318,296,000, Indiana 136,937,000, Minnesota 135,136,000, Ohio 112,912,000, and Missouri 112,789,000 bu. Wisconsin, Minnesota, New York, Pennsylvania, and Iowa again led in order of silage production. The season average price per bu. (preliminary) received by farmers averaged 62.4 cents in 1940 and the value of production was estimated at \$1,528,440,000 versus 56.7 cents and \$1,476,300,000 in 1939. See *Crop Production Table* under AGRICULTURE; AGRICULTURAL ADJUSTMENT ADMINISTRATION; COMMODITY CREDIT CORPORATION; ENTOMOLOGY, ECONOMIC; FARM MACHINERY AND EQUIPMENT.

**COSMETICS.** See FASHION EVENTS; FOOD AND DRUG ADMINISTRATION.

**COSMIC RAYS.** See PHYSICS.

**COSTA RICA.** A Central American republic Capital, San José.

**Area and Population.** Area, 23,000 square miles; estimated population, 639,197 on Dec. 31, 1939. The people are largely of Spanish and other European descent, except for some 18,000 Negroes in the Atlantic banana zone and about 3000 aboriginal Indians. Live births in 1938 numbered 26,830; deaths, 10,422; net immigration, 416. Estimated populations of the chief cities (1938): San José, 70,568; Cartago, 20,452; Limón, 16,699; Alajuela, 11,877; and Puntarenas, 8514.

**Education and Religion.** The illiteracy rate is one of the lowest in Latin America. At the beginning of 1939 there were 669 elementary schools with 66,317 pupils, 2 secondary schools with 1228 students, a normal school with 562 students, and 2 colleges, at Cartago and Alajuela. A law establishing the University of Costa Rica in the capital was signed Aug. 26, 1940. The existing Schools of Law, Pharmacy, Agriculture, Pedagogy, and Art were incorporated in the new institution, and Schools of Engineering, Sciences, Liberal Arts, Dentistry, and Medicine were to be added as resources permitted. Roman Catholicism is the state religion.

**Production.** Coffee, bananas, and cacao comprised 84.8 per cent of the 1939 exports. The value of the 1938-39 coffee crop was \$4,644,301. Banana exports in 1939 (calendar year) were 3,429,787 stems; cacao, 7,672,374 kilograms (of 2.2 lb.). Other 1939 crops were estimated as follows: Corn, 59,300 bu.; beans, 19,000 bu.; rice, 7050 metric tons; sugar, 10,950 metric tons; potatoes, 8100 bu. Fruits and vegetables are grown for local consumption. Gold and salt are the only minerals produced. A few articles for domestic use are manufactured, as cigars, cigarettes, furniture, candles, cheese, etc.

**Foreign Trade.** Imports in 1939 in U.S. currency totaled \$16,884,992 (\$12,620,721 in 1938); exports, \$9,086,498 (\$10,145,614 in 1938). The 1939 imports included \$3,873,475 worth of special imports for development of the United Fruit company's new Pacific Coast banana plantations. Exports of coffee in 1939 were \$4,644,301; bananas, \$1,911,084; cacao, \$1,150,856. The United States took 45.6 per cent of the 1939 exports, Germany 25.1, United Kingdom 16.9. Of the imports, the United States supplied 58.8 per cent, Germany 17.7, Japan 5.1, and the United Kingdom 3.9. See TRADE, FOREIGN.

**Finance.** Estimated receipts and expenditures for 1940 balanced at 32,835,000 colones. Actual 1939 receipts were 42,717,000 colones; expendi-

tures, 40,288,000. The public debt on Dec. 31, 1939, totaled 133,088,480 colones (external, 100,169,428; internal, 32,919,052). This represented a reduction of 16,183,807 colones since Apr. 30, 1936. Average exchange rates of the colon: Controlled, \$0.1779 in 1938 and 1939; uncontrolled, \$0.1770 in 1938, \$0.1764 in 1939.

**Transportation.** There were 413 miles of railways in 1940, 405 miles of improved roads, about 1400 miles of unimproved roads and trails, and a domestic air network connecting with Pan American Airways. Receipts of the state-owned Pacific Railway connecting San José with the Pacific port of Puntarenas rose from 4,629,578 colones in 1937 to 5,651,069 in 1939. A total of 661 ships of 1,587,-837 tons entered and cleared the ports in 1938.

**Government.** Executive power is vested in a president elected for 4 years and legislative power in a Congress of 44 members, half of whom are elected (for 4 years) every 2 years. President at the beginning of 1940, León Cortés Castro (Republican National party), who assumed office May 8, 1936. See *History* for 1940 elections.

**History.** The arrangement made by opposition parties in 1939 to run a coalition candidate against Dr. Rafael Angel Calderón Guardia, nominee of the Republican National (government) party, fell through and Dr. Calderón Guardia was the victor in the Presidential election of Feb. 11, 1940. He received 82,220 votes as compared with 9676 for the Communist candidate, Manuel Mora, and 6174 for Prof. Vergilio Salazar Leiva, nominee of the Guanacasteca party, a regional, anti-Communist movement, the stronghold of which is the province of Guanacaste. Voting was secret and compulsory for the first time. In his campaign, the President-elect pledged himself to follow Costa Rica's democratic tradition and his predecessor's economic policy as well as to support the Pan American movement. Dr. Calderón Guardia was inaugurated May 8 following a pre-inaugural visit to Washington on March 25-29. There he received a cordial welcome in both official and unofficial circles.

Both President Cortés Castro and his successor devoted their major efforts during 1940 to the development of a defense program in co-operation with the United States and to measures necessitated by the adverse economic effect of the European War. It was announced at San José January 16 that U.S. Navy planes and warships had been authorized to enter Costa Rican territorial waters on both coasts at any time in connection with the enforcement of the Pan American security zone. Upon President Roosevelt's return to Washington from his Caribbean tour on March 3, it was unofficially reported that the Costa Rican Government had consented to the use of its air fields by United States planes if necessary for wartime defense of the Panama Canal.

On March 26, during his visit to Washington, Dr. Calderón Guardia stated in a press interview that his country was ready and willing to take all necessary measures for joint defense of the Canal. In August United States army officers visited San José and were reported to have reached an agreement on the details of joint military co-operation. Enlargement of Costa Rica's tiny army of 500 men and its training by a United States military mission was contemplated.

The United States Government on September 5 proposed a plan for the development of rubber plantations in Costa Rica with United States financial and technical aid. The following day Presi-

dent Calderón Guardia announced that his government had offered to lease Cocos Island in the Pacific to the United States for the establishment of a naval and air base. The U.S. Treasury on September 24 advanced a \$4,600,000 loan to Costa Rica for the construction of the section of the Pan American Highway between San José and the border of Panama. The loan was guaranteed by the National Bank of Costa Rica and was to be repaid from proceeds of the gasoline tax.

In January the Costa Rican Government withdrew its objections to canalization of the San Juan River, linking Lake Nicaragua with the Caribbean and forming the eastern sector of the Nicaraguan-Costa Rican frontier (see 1939 YEAR BOOK, p. 172). A treaty authorizing construction of a barge canal and providing for free navigation by Costa Rican traffic was signed with Nicaragua on Apr. 5, 1940.

Costa Rica's co-operation with the United States was aided by the growing anti-German and anti-Italian sentiment manifested by the population as a result of European developments and of Nazi activities in Costa Rica. The government in May began to eliminate pro-Nazi Germans from important positions and to curb their propaganda. On July 10 popular indignation was aroused by the revelation that the German Minister to the Central American republics had sent notes to the Costa Rican and other neighboring governments stating that it would be "disadvantageous" if they supported any measures at the forthcoming Havana Conference affecting their neutrality. Costa Rica replied in substance that it could not permit foreign interference to influence its policy of co-operation with other Latin American countries and alignment with the United States.

The decline of coffee exports to Great Britain as a result of the European War made the country more than ever dependent upon trade with the United States and placed growers of coffee and other export crops in a difficult position. The government met the situation in part by advancing credit on liberal terms to farmers. In mid-year a National Agricultural Council was created to adjust agricultural production to the country's domestic needs and to changing export markets. On July 24 it was announced that the coffee crop would be marketed in the United States and Canada with government financial aid in the future. A Sugar Board to assist and control the sugar industry was established Aug. 29, 1940. The collapse of Costa Rica's European markets was offset in part by the United Fruit Company investments, totaling about \$3,000,000 annually, in new banana plantations on the Pacific Coast. However, the company curtailed its shipping services to Puerto Limón on the Atlantic Coast with adverse effects upon the tourist trade.

See NICARAGUA under *History*; PAN AMERICANISM; PAN AMERICAN UNION.

**COST OF LIVING.** See LIVING COSTS AND STANDARDS.

**COTTON.** The United States cotton crop for 1940, as estimated by the U.S. Department of Agriculture on Dec. 9, 1940, amounted to 12,686,000 bales of 500 lb., as compared with 11,817,000 bales in 1939, 11,943,000 bales in 1938, and the record crop of 18,946,000 bales in 1937. The lint yield averaged 252.4 lb. per acre compared with 237.9 lb. in 1939, the record of 266.9 lb. in 1937, and 198.1 lb., the 1929-38 average. Four per cent of the 25,-073,000 acres in cultivation July 1, 1940, were abar-

doned later, leaving 24,078,000 acres for harvest, compared with 23,805,000 acres in 1939.

The world carry-over of American cotton on Aug. 1, 1940, as estimated by the New York Cotton Exchange Service, was about 12,649,000 bales compared with 14,137,000 at the end of the previous season and 13,787,000 two years before. The carry-over of American cotton in the United States, estimated at 10,469,182 running bales, together with the above estimate of world total, indicated the carry-over of American cotton in foreign countries on Aug. 1, 1940, at about 2,053,280 bales. Of the total domestic stocks in the United States as of Aug. 1, 1940, slightly more than 8,700,000 bales were under Government loan or owned by the Government, which would indicate a total of only 1,900,000 bales of "free" stocks, including nearly 100,000 bales of foreign cotton. World mill consumption of American cotton during the season ended July 31, 1940, was estimated at 12,889,000 bales compared with 11,249,000 bales in 1938-39, and 12,400,000, the 1929-38 average.

The world supply (carry-over plus production) of all cotton for the 1940-41 season was estimated in December to total about 49,777,000 bales. This season was the fourth consecutive year that the total world supply of cotton was close to 50 million bales, for prior to these years it had never reached 45 million. World production also had been unusually high in recent years. Nevertheless, the carry-over had become much larger relative to production and in the last three years made up 41 to 45 per cent of the total supply. World carry-over of all cotton on August 1 was about 20,322,000 bales, compared with 21,569,000 bales a year earlier and the 10-year average, 15,500,000 bales.

The world supply of American cotton prospective for the current season, 1940-41, was indicated at about 25,300,000 bales, about 400,000 bales less than in 1939-40 and slightly below the record supply, 26,224,000 bales of 1932-33. The 1940-41 season was the fourth consecutive year that the world supply of American cotton had approximated 25 million bales; except for 1931-33 and 1926 the supply never before exceeded 21 million bales. In the last three years the carry-over constituted 50 per cent or more of the supply, with 50 to 78 per cent of the carry-over consisting of Government loan stocks.

Cotton production in 1940 in the countries reported was estimated to be, for the United States, 12,686,000; India, 4,405,000; U.S.S.R. (Russia), 4,300,000; China, 2,350,000; Egypt, 1,922,000; Brazil, 2,199,000; Mexico, 275,000; Italy, 44,000; Chosen, 198,000; Turkey, 360,000; Uganda, 290,000; Iran, 230,000; Greece, 80,000; and Bulgaria, 46,000 bales. The total world production in 1940-41 was tentatively indicated by the U.S. Department of Agriculture late in 1940 at 30,500,000 bales compared with 28,900,000 in 1939-40.

World production of commercial cotton in 1939 was estimated by the U.S. Bureau of the Census to be 27,875,000 (478 lb.) bales, of which the United States produced 11,481,000 (running) bales; India, 5,000,000; U.S.S.R. (Russia), 4,000,000; Egypt, 1,801,000; China, 800,000; Brazil, 1,982,000; Peru, 390,000; Mexico, 243,000; and all other countries, 2,178,000 bales. In 1939-40, Argentina produced 362,481 bales; Uganda, 289,000 bales; Belgian Congo, 161,000 bales; and Anglo-Egyptian Sudan, 245,000 bales.

The cotton crop of the United States for 1939, as reported by the U.S. Bureau of the Census, the

estimated crop for 1940 and the quantity reported ginned to Dec. 13, 1940, are shown in the accompanying table.

UNITED STATES COTTON CROP 1939-40

States	Crop in 1939 500-lb. bales	Estimated crop, 1940 500-lb. bales	Bales <sup>1</sup> ginned Dec. 13, 1940
United States .....	11,815,759	12,686,000	11,433,304
Alabama .....	781,602	790,000	738,510
Arizona .....	202,502	195,000	117,823
Arkansas .....	1,421,694	1,540,000	1,331,177
California .....	442,327	525,000	495,116
Florida .....	9,026	20,000	17,845
Georgia .....	919,349	1,020,000	979,847
Louisiana .....	744,898	455,000	445,811
Mississippi .....	1,585,149	1,280,000	1,149,204
Missouri .....	431,774	380,000	337,104
New Mexico .....	95,320	123,000	99,124
North Carolina .....	460,166	740,000	717,078
Oklahoma .....	517,373	805,000	673,791
South Carolina .....	873,288	970,000	927,505
Tennessee .....	445,489	515,000	433,920
Texas .....	2,858,525	3,285,000	2,936,528
Virginia .....	10,285	25,000	19,937
All others .....	16,992	18,000	12,984

<sup>1</sup> Running bales.

The table includes for 1940, under the ginning report, 3482 round bales counted as half bales and also 23,560 bales of American-Egyptian cotton and 4520 bales of Sea Island cotton, grown largely in Georgia and Florida. The 1940 crop of Arizona was estimated to include 37,000 bales of American-Egyptian cotton grown on 68,600 acres.

The cotton of the 1940 crop ginned up to Dec. 13, 1940, averaged slightly higher in grade and considerably longer in staple compared to that ginned up to Dec. 13, 1939, according to reports based on the 11,405,224 bales of American upland cotton ginned to that date. About 85.9 per cent of the cotton ginned up to Dec. 13, 1940, was tenderable on future contracts compared to 92.6 in 1939.

Oil mills in the United States, during the cotton year ended July 31, 1940, crushed 4,150,755 tons of cottonseed. The products of the seed included 1,072,339 bales of lint, 1,054,778 tons of hulls, 1,882,217 tons of cake and meal, and 1,325,241,460 lb. of oil.

The consumption of all cottons in the United States rose in 1939-40 to 7,783,774 bales from 6,858,426 bales in 1938-39, and that used by American mills was consumed largely, more than 85 per cent, in the cotton growing States. Cotton consumption in the United States had fluctuated between 5 and 8 million bales per season since 1913-14. In the 1940-41 season domestic consumption was expected to exceed 8,500,000 bales in response to the general improvement in industrial production, increased factory employment, larger consumer purchasing power, and large Government purchases of cotton textiles for national defense purposes.

World consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1940, as indicated by estimates based on reports of the New York Cotton Exchange Service and the U.S. Bureau of the Census, were equivalent to about 28,345,000 bales, compared with 28,486,000 in 1938-39 and about 2,300,000 bales above the 1929-38 average. Of the total consumption in 1939-40, about 15,456,000 bales were foreign and 12,889,000 American. World mill consumption in the last four years, of 28 million to 31 million bales, had been considerably higher than ever before. The British blockade, if continued, together with other developments, seemed likely to reduce materially world consumption in 1940-41 despite a record

high consumption in the United States. Consumption of American cotton in countries other than the United States rose in 1939-40 to 5,234,000 bales, while non-American cotton in countries other than the United States decreased to 15,327,000 bales. The near-record consumption in the United States in 1939-40 largely offset the low consumption of American cotton in foreign countries, the world total being about average. World consumption of American cotton during the 1940-41 season seemed likely to drop considerably below average even with a record high domestic utilization.

Prices of middling  $\frac{7}{8}$ -inch cotton at the 10 spot markets averaged 9.90 cents per lb. during the year ended July 31, 1940, compared with 8.70 in 1938-39, 8.66 in 1937-38, 12.70 in 1936-37, and 11.32 cents, the 1928-37 average. Prices averaged in January, 1940, 10.62 cents, February 10.63, March 10.42, April 10.45, May 9.93, June 10.29, July 10.19, August 9.72, September 9.28, October 9.17, November 9.45, and closed on December 31 at an average of 9.87 in the southern spot markets, and at 10.43 cents in New York and at 8.72d. at Liverpool. Since August, 1939, spot prices in domestic markets have been based on middling  $\frac{15}{16}$ -inch cotton and between August, 1939, and December, 1940, the monthly average ranged from 0.17 to 0.22 cents above  $\frac{7}{8}$  inch. Prices received by producers at local farm markets on Dec. 15, 1940, were estimated to average 9.33 cents per lb. for lint and \$24.08 per ton for cottonseed compared with 9.71 cents and \$24.75, respectively, on Dec. 15, 1939. The value of production of cotton lint was estimated (preliminary) at \$595,720,000 in 1940 and of cottonseed \$121,232,000 compared with \$536,923,000 and \$111,589,000 reported in 1939.

Since the 1940 loan was announced August 9, the average spot price of  $\frac{15}{16}$ -inch cotton in the 10 designated markets exceeded the average loan rate of 9.3 cents usually by amounts ranging up to 0.75 cent per lb. Nevertheless, about 2,666,160 bales had been pledged as collateral for Government loans through December 30, totaling \$128,510,831.

See AGRICULTURAL ADJUSTMENT ADMINISTRATION; AGRICULTURAL MARKETING SERVICE; COMMODITY CREDIT CORPORATION; FERTILIZERS; TEXTILES. For the Cotton Stamp Plan, see SURPLUS MARKETING ADMINISTRATION.

**COUNTERFEITING.** See SECRET SERVICE, U.S.

**COUNTERVAILING DUTIES.** See CUSTOMS, BUREAU OF.

**COURT GAMES.** Court Tennis. The strenuous game of court tennis continued to claim the attention of fans and principals throughout 1940. James H. Van Alen of Roslyn once again succeeded to the national amateur court tennis championship, outplaying Alstair Bradley Martin, a sensational newcomer to the game, in the final. Ogden Phipps, the winner in 1939, was unable to participate in the competition because of an injury to his legs. Teamed with his elder brother, William Laurens Van Alen, the new champion also plucked the doubles title. Earlier in the season, Ogden Phipps defeated James Van Alen to carry off the Tuxedo Gold Racquet in court tennis. Pierre Etchebaster of New York, world's open court tennis champion, was not called upon to defend his title and thus automatically it remained with him. The Payne Whitney Trophy was won by the Philadelphia team.

Racquets. Robert Grant 3d of New York, un-

defeated in racquets for two years, injured an ankle in the semi-final frame of the open invitation tournament for the Clarence C. Pell Cup and was vanquished several weeks later in the final by Kenneth Chantler of Montreal. The injury kept Grant out of the national amateur championship competition.

A strange coincidence occurred in the final championship when Warren Ingersoll of Philadelphia also sustained an ankle injury. At the time, he was leading Reginald Fincke Jr. of New York by two games to none. Following a postponement of many weeks the match was resumed and Ingersoll emerged the winner. Grant also eschewed the national doubles, in which he had shared the title with Clarence C. Pell Jr. The new champions are J. Richard Leonard and Malcolm Kirkbride of Tuxedo. Leonard was top man at the Tuxedo gold racquet tournament. David S. Milford of England retained his world's open championship.

**Squash Racquets.** The amateur squash racquets title was won by A. Willing Patterson of Philadelphia, who defeated H. Sherman Howes of Boston in a four-game struggle. The retiring champion, Donald Straghan, did not participate in the match.

For the fourth year in succession, the Bostonians carried away the national team championship. Philadelphia captured the national veterans' title when Roy R. Coffin outdid Ralph A. Powers of Connecticut in the final. Kin Canavaro of Harvard grabbed the intercollegiate laurels.

Alfred Ramsay of Cleveland regained the national professional championship by vanquishing Eddie Schaffer of Pittsburgh in the final. The 1939 winner, Lester Cummings of New York did not enter the contest.

Miss Cecile Bowes of Cynwyd, Pa., captured the women's United States squash racquets championship, outplaying Miss Barbara Williams of Rockaway Hunt in the final test at the Junior League courts.

**Squash Tennis.** In the field of squash tennis, Tommy Iannicelli, of the Short Hills, N. J., Club, continued his hold on the world open professional championship. He defeated Joseph J. Lordi, New York A. C. amateur, in the final, and thereby annexed the title for the sixth straight time. For the 11th successive year, Harry F. Wolf of the New York A. C. reigned as king of the national amateurs.

Phil Moore of the Columbia University Club defeated the former national champion, Rowland B. Haines, for the veterans' title.

**COURTS. General.** Current reviews contain: "Circuit Courts and the Nisi Prius System," 38 Mich., L. Rev. 289 (W. W. Blume); "Need for Three Judge Trial Court" (apropos of 1939 Michigan statute providing therefor), 24 *Int. Am. Jud. Soc.* 76; Rule Making: "Recent Developments," 18 *N. Car. L. Rev.* 167; "Powers of Equity Court in State Tax Litigation," *ibid.* 610 (M. S. Culp); "Judicial Review of Private Tribunals' Decisions," 4 *Md. L. Rev.* 179 (L. Snyder). Rev.* 623; 26 *Va. L. Rev.* 375); "Must lower state court decisions be followed?" *Field v. Trust Co.*, 108 *Fed.* (2d) 521 (Comment, 53 *Harvard L. Rev.* 880; 88 *U. of Pa. L. Rev.* 487; 24 *Minn. L. Rev.* 692); reversed by Supreme Court, December 9. An Act of Congress of July 3, extends the U.S. Court for Hawaii's jurisdiction to eight additional islands, including Midway and Wake, whose importance has been greatly enhanced as way stations for the China Clipper.

**State. Illinois.** "Rules Under New Probate Act," 5 *Jno. Marshall L. Quar.*, 171 (J. F. O'Connell); **Louisiana.** "Supreme Court's Work, 1938-39," 2 *La. L. Rev.* 31; **Mississippi.** Same, 12 *Miss. L. Jnl.*, 1; **Missouri.** Same for 1938, 4 *Mo. L. Rev.*, 345; **New York.** "Surrogate's Jurisdiction over Subject Matter and *Res.*," *re Mills' Estate*, 11 *N.Y.S.* (2d) 992, *New York reviewed*, *Cornell L. Quar.*, 146; **Wisconsin.** Supreme Court's Work, 1938-39; 1940 *Wis. L. Rev.* 5.

**Foreign. Sacra Romana Rota.** (See 20 *Georgetown L. Jnl.* 14.) The latest juridical year of this six century old tribunal was inaugurated at Rome on October 1, in the presence of the Pope who in reply to an address by Monsignor Grazioli, Dean of the Consistorial lawyers (reciting that of the 69 cases presented to the court in 1939, 65 were for annulment, which was granted in 16) called it the tribunal of the Christian family, ready to safeguard its sanctuary, but equally to recognize its non-existence when matrimony had not been validly contracted. Of the 10 *auditores* constituting the *Rota* all were present except the American member, Rev. J. F. Brennan, who had been delayed.

**British Courts Martial.** To secure passage of its bill to set up one-man courts in the war zone, the Government was obliged to promise judicial review of capital sentences and of those for serious offences not capital.

**Judges.** Current articles are "The Judicial Office Today," 25 *A.B.A. Jnl.* 731 (R. Pound); "Judicial Selection and Tenure," 15 *Ind. L. Jnl.* 215 (M. N. Feightner); "Evils of Brief Tenure," 11 *Rocky Mt. Rev.* 217 (F. Swancara) Prof. Max Radin, Boalt Hall of Law, Univ. of Calif., nominated by Governor Olson under the system of selection adopted in 1934 for Supreme Court judges, failed of confirmation by the Judicial Qualifications Commission. Of its three members, the Presiding Appellate Court Judge and the Attorney General gave as their reasons for voting against the nominee that he "was without judicial experience and lacking in judicial temperament"

On November 5, Missouri adopted a constitutional amendment for a non-partisan judiciary, embodying most features of the California system (24 *Jnl. Am. Jud. Soc.* 118; 27 *A.B.A. Jnl.* 9). Maryland adopted one for "People's Courts"; but West Virginia rejected one for a "reform judiciary" to displace Justices of the Peace and constables with summary courts.

**Norway.** During Dec. 12, 1940, the members of the Norwegian Supreme Court resigned in protest against the autocratic and illegal action of the Quisling (Nazi) government in arresting one of their number and assuming the power to dismiss judges and other officials of the judicial branch.

**Mexico.** President Camacho, shortly after his

inauguration, appointed new *magistrados* of the *Tribunal Supremo* and they chose as *Presidente*, thereof, Salvador Urbina, a former member.

**Discipline.** Hulon Capshaw, New York City Magistrate, appointed originally by Mayor Walker in 1929 (upon the recommendation, it is said, of such prominent citizens as Bishop Manning, John W. Davis, and Frank L. Polk) was removed on January 27, by order of the appellate Division, for misleading testimony in the *Hines Case* (1938 *YEAR BOOK*, 397). Three of the five justices found him guilty of "bias and unjudicial conduct which must have been influenced by considerations outside the record." Two days earlier, Philippine President Quezon had removed a Justice of the Peace in Rizal Province, adjoining Manila, for his "propensity to utilize his position to wreak vengeance upon his enemies." Judge Yang Chi, President, Second Special District Court, in the French Concession, Shanghai, was suspended from office for five years by the Central Chinese Government for implication in an opium deal for which a relative and court official had been sentenced to life imprisonment.

**Juries.** The District of Columbia District Court announced a reduction of the 550 persons periodically summoned there for jury duty. "Peremptory Challenges of Jurors" (those allowed as of right and not for cause) are discussed in 14 *St. John's L. Rev.* 142 (R. A. Klein); "Directing Verdict," 12 *Miss. L. Jnl.* 350 (S. Sanders); "Impeaching Verdict by Juror's Affidavit," 12 *Rocky Mt. L. Rev.*, 222; "Involuntary Non-Suit," 16 *Tenn. L. Rev.* 366; "Verdicts by Lot," *Vogt v. Curtis*, 200 *Wash.* 692 (Comment, 15 *Wash. L. Rev.* 124.)

The question whether women jurors impair the constitutional rights of litigants, was considered in "*People ex rel. Denny v. Traeger*," 372 *Ill.* 11 (Comment, 18 *Chicago-Kent L. Rev.* 103); effect of witness' refusal to swear secrecy, in *Goodman v. U.S.* 108 *Fed.* (2d) 516 (Comment, *ib.* 309). Justice McGeehan (who first heard the Russell case) refused a certificate of incorporation of the "Grand Jurors Association of the Bronx, N.Y., Inc.," numbering 35, some no longer active, lest it "might tend to stifle freedom of thought and action" in their deliberations.

**The Bar.** The "Bar Integration movement" (1939 *YEAR BOOK*, 422) now includes half of the States and an act therefor has been drafted for the Tennessee Bar Ass'n. to be presented to the legislature (26 *A.B.A. Jnl.* 653 & references); "Integration by Supreme Court Rule," 24 *Marquette L. Rev.* 901 (R. D. Jones); "Some Problems Facing Integration," 19 *Or. L. Rev.* 1 (R. R. Bullivant); "Is it Needed?" 14 *Ind. L. Jnl.* 529 (H. M. Dowling); "More Effective Bar Organization," 15 *ib.* 297 (C. A. Beardsley).

**Admission.** "Judicial Control of," 8 *G.W.L. Rev.* 1085, (A. R. Poore); *Lineberger v. State*, 174 *Tenn.* 538 (Comment, 16 *Tenn. L. Rev.* 239; cf. *ib.* 422, W. R. Blackard). Another side of the question is disclosed by the refusal of Judge Thomas Brown, of the New Jersey Circuit Court, to permit a New York lawyer to appear in a case before him on June 3, unless the lawyer was "a believer in God." The judge did "not believe that any witness nor any . . . applicant for public office, has the right to take oaths, unless he can swear to God." Such a test would have barred Dr. Einstein, who, on October 1 following, was admitted to citizenship in the same State by Federal Judge Forman, who described the applicant as one

"who thinks in terms of all the universe" and whose "presence here becomes America's gain." But the problem of a satisfactory character test still baffles the bar examiners. Before a committee of the New York Bar Association, at its 63d annual meeting, Dean Wilkinson of the Fordham Law School, advocated character examination before beginning legal study and strict sponsorship during the course thereof. See "The Sponsor System under Law School Auspices," 25 *A.B.A. Jnl.* 849; "Character Examination in Pa." *ib.* 873 (R. T. McCracken).

**Conduct and Discipline.** The Secretary of the Treasury's right to exclude a retired army officer from practicing before that department was upheld in *Morgenthau v. Barrett*, 108 Fed. (2d) 481 (cert. denied 309 U.S. 672; reviewed 8 *G.W.L. Rev.* 974). In 28 *Georgetown L. Jnl.* 226, W. J. Deem discusses the bill to prevent discrimination between law schools in selecting government attorneys; Max Radin, "Contingent Fees in California," 28 *Cal. L. Rev.* 587; J. P. Curry, "Grounds for Disbarment and Suspension in Kentucky," 28 *Ky L. Jnl.* 336. Conviction of illegally selling an opiate is such a ground. *In re McNeese*, (Mo.) 142 S.W. (2d) 33; also claiming the privilege against self-incrimination *Matter of Ellis* 282 N.Y. 435 (Comment, 53 *Harv. L. Rev.* 871); and "shadowing" jurors, *In re Doe*, 95 Fed. **Proof.** "The Rules of Evidence—An Empirical Study in Psychology and Law," 25 *Cornell L. Quar.* 556 (S. H. Britt); "Scientific Gadgets in the Law of Evidence," 53 *Harv. L. Rev.* 285; "The Uniform Evidence Acts," 6 *O. St. U. L. Jnl.* 256 (J. E. Hallen); (in Pa.), 14 *Temple U. L. Quar.* 267 (and physicians), 6 *U. of Pittsburgh L. Rev.* 59 (J. R. McCraight); "Science Can Get the Confession," 8 *Fordham L. Rev.* 334 (W. G. Summers).

Tentative Draft No. 1, comprising four chapters (304 Rules) of the proposed "Code of Evidence," submitted to the American Law Institute as its first item of new business at its 18th annual meeting, evoked a preliminary discussion of plan and form. Dean Wigmore, the chief consultant, favored specific rejection or adoption of each concrete rule in the various jurisdictions. Judge Clark urged broad grants of power with details left to the trial judge's discretion. The latter, which was the plan of the twelve draftsmen, was adopted;

but only 115 rules were considered, all of Rule 4, except par. 1, was deleted and Rule 115 was changed slightly. The others will not be passed upon until the 1941 meeting.

**Admissibility. Blood Tests**, in paternity cases, are discussed in 15 *Notre Dame Lawyer*, 153 (R. F. Sullivan); 44 *Dickinson L. Rev.* 205 (A. M. Ash); *State ex rel. Slovak v. Halod*, 63, App. 16; *State v. Wright*, (Comment, 59, O. App. 191; 25 *La. L. Rev.* 823; (Comment, 14 *U. of Cincinnati L. Rev.* 443; 6 *O. St. U. L. Jnl.* 200). Such tests were ordered, for the first time in the District of Columbia District Court, in *Beach v. Beach* (3 *Fed. Rules Service*, 35 A. 5) and for husband, wife, and child.

**Fingerprints** taken by the FBI aggregated 12,086,951 by Jan. 31, 1940. After June 29 were added not only those taken in course but those of all aliens who registered under the act of that date.

**Hearsay.** "The Role of, in a Rational Scheme," 34 *Ill. L. Rev.* 788 (G. F. James); "and the English Evidence Act," *ib.* 974; "Business Records" (statutory), 6 *U. of Pittsburgh L. Rev.* 9 (J. A. Metz). Dying Declarations were received as *res gestae* in *Mitchell v. N.Y.L. Ins. Co.*, 136 *O. St.* 55, a civil case (Comment, 14 *U. of Cincinnati L. Rev.* 449).

**Lie Detector** (Polygraph) is used as an aid to law enforcing agencies in seven States and fifteen cities, and is reported as reducing the time for investigations and in relieving innocents of suspicion. Its admissibility is discussed in 15 *Notre Dame Lawyer*, 159 (E. F. Grogan, Jr.).

**Res Ipsa Loquitur**, 14 *Canadian Bar Rev.* 480 (G. W. Paton), is declared to "raise merely an inference of fact" whose weight the jury should determine. Rule applied in *Brown v. St. Louis Co. Gas Co.*, (Mo.) 131 S.W. (2d) 354 (Comment, 8 *U. of Kan. Cy. L. Rev.* 51).

**Self-Incrimination.** "The Privilege Against," 49 *Yale L. Jnl.* 1059; Rule applied to truckdrivers' time cards, *People v. Creedon*, 281 N.Y. 413 (Comment, 88 *U. of Pa. L. **CREDIT UNIONS.** See Co-OPERATIVE MOVEMENT.

**CRETE (KRETE).** A Greek island comprising the four departments of Canea, Erakleion, Lasithion, and Rethymnon. Area, 3235 square miles; population (Jan. 1, 1939), 386,427. Capital, Canea (Khania), 26,604 inhabitants.

Crete was drawn into the European conflagration by the Italian attack upon Greece at the end

of October, 1940. British military, naval, and air forces were immediately rushed to Suda Bay on the northwestern coast of the island. They strengthened Crete's fortifications and converted it into a base for offensive air and naval operations. The towns of the island were subjected to repeated Italian bombings. See *EUROPEAN WAR*; *GREECE under History*.

**CRICKET.** In the jolly game of cricket, there were several notable matches here in America, not to mention less publicized contests in England itself. There was an absence of teams from abroad, but an international flavor was provided by a match during July between British Americans and British West Indians, in which the former rode to victory.

The British Purchasing Commission put a team in the field against a picked aggregation representing the New York and Metropolitan District Cricket Association, the New York eleven carrying off the honors.

After playing a series of games in Canada, the Philadelphia General Electric C. C. took part in the annual championship of the New York and Metropolitan District Cricket Association and finished first. The Brooklyn C. C. was second.

**CRIME.** See *ANTHROPOLOGY under The Criminal*; *FEDERAL BUREAU OF INVESTIGATION*; *JUVENILE DELINQUENCY*; *LAW*; *PRISONS, PAROLE, AND CRIME CONTROL*; *PSYCHOLOGY under Social Psychology*; and the States where leading cases have occurred, as *NEW YORK under History*.

**CROATS.** See *YUGOSLAVIA*.

**CROPS.** See *AGRICULTURE* and the topics there referred to, especially the major crops; also the countries under *Production*.

**CROSS-COUNTRY RUNNING.** Don Lash, who in private life is an Indiana State policeman, captured the national A.A.U. cross-country championship for the seventh successive year in 1940, and thereby added another record to his long list. On one occasion he outpaced Greg Rice, his two-mile nemesis, over a 200-yard course and on another he set a record for the 10,000 meter distance of 30:25.8, leaving a number of noted runners behind him on the track.

Luigi Beccali, the 1932 Olympic 1500-meter champion, who was a member of the New York A. C. in 1940, Gene Venzke, Joe McCluskey, and Walter Mehl were some of the stars who felt his dust in their faces. The New York A. C. carried off the team championship.

Leslie MacMitchell of N. Y. U. was the outstanding collegiate performer of the year. He first won the metropolitan intercollegiate title and then the intercollegiate A.A.A.A. crown, both of them in record time. MacMitchell to date has never known the sour taste of defeat in cross-country competitions.

Rhode Island State College won the team competition in the I. C. 4-A, with Michigan State and Manhattan following in that order. Nevertheless, in the National Collegiate A. A. meet at East Lansing a week later, the New Englanders could do no better than third, yielding to Indiana and Michigan Normal. Gilbert Dodds of Ashland College was the individual victor, MacMitchell refraining from that competition.

John Ayer of Cornell and his team captured the Heptagonal honors, Wayne Tolliver and Indiana the Western Conference championship.

**CUBA.** An island republic of the West Indies. Capital, Havana (Habana).

**Area and Population.** Area, 44,164 square

miles; estimated population on Jan. 1, 1939, 4,227,597 (about 60 per cent white, 40 per cent Negro). United States citizens living in Cuba on Jan. 1, 1940, numbered 5121. Estimated populations of the chief cities in 1938 were: Havana, 568,913; Holguin, 140,854; Camaguey, 139,295; Santiago de Cuba, 107,125; Santa Clara, 99,509; Cienfuegos, 92,258; Matanzas, 72,826; Guantánamo, 68,372; Manzanillo, 65,965.

**Defense.** The active army on Nov. 1, 1940, numbered 14,262 officers and men; trained reserves, 29,389. The air force comprised 266 men with about 16 planes. The navy consisted of 2 escort vessels, 5 gunboats, an armed transport, and various small coastguard vessels, staffed with 2530 men and 130 officers.

**Education and Religion.** About 39 per cent of the adult population was illiterate at the 1931 census. Statistics for 1938-39 showed 424,094 pupils in 8786 public classrooms, 31,023 pupils in 360 private schools, 3089 pupils in 145 communities taught by travelling teachers, 8972 pupils in 138 night schools for workers, 21 high schools, 8 normal schools. The University of Havana has about 6000 students. Roman Catholicism is the dominant religion but there is no state church.

**Production.** Agriculture is the main occupation and sugar and tobacco are the chief crops. Raw and refined sugar accounted for 71.7 per cent of the value of all exports in 1939. Sugar production in 1939 amounted to 2,720,127 long tons (of 2240 Spanish lb.) as against 2,975,683 tons in 1938. The value of the crop was 91,885,890 Cuban pesos (96,650,090 in 1938). The sugar production quota for 1940 fixed in the decree of Jan. 13, 1940, was set at 2,753,903 Spanish long tons. The 1940 tobacco crop was 55,426,000 lb., the largest since 1931. Corn, cacao, rice, fruits, and vegetables are other crops. Livestock in 1938 included 5,074,108 cattle, 587,463 horses, and 83,989 mules. Mineral production in 1939 was valued at about \$10,025,000, the chief items being: Manganese ore, 100,797 long tons, \$2,497,737; sea salt, 125,000 short tons, \$2,224,000; copper concentrates, 36,629 short tons, \$1,306,686. Iron ore, chrome ore, barite, petroleum, gypsum, and gold are mined in small quantities. Tourists entering Cuba in 1939 numbered 135,635 (158,013 in 1938). Manufacturing is expanding, the chief products being vegetable oils, meat products, clothing, footwear, furniture, textiles, etc. The 1939 unemployment census showed 384,614 jobless (338,447 men and 46,167 women).

**Foreign Trade.** Imports in 1939 were valued at 105,862,000 pesos (106,007,000 in 1938) and exports at 147,676,000 pesos (142,678,000 in 1938). The chief 1939 exports were: Raw sugar, 84,216,000 pesos; refined sugar, 21,633,000 pesos; leaf tobacco, 11,058,000 pesos; molasses, 8,893,000 pesos; minerals, 4,621,000 pesos. The United States supplied 74.1 per cent of the 1939 imports (70.9 per cent in 1938) and took 75.3 per cent of the exports (76.0 in 1938). See *TRADE, FOREIGN*, for 1940 trade with the United States.

**Finance.** Budgetary revenues collected during 1940 totaled 75,670,000 pesos (71,229,000 in 1939) and expenditures were 79,238,000 pesos (76,000,000 in 1939). By a decree of Dec. 31, 1940, the 1940 budget was extended into the first quarter of 1941. The public debt on Jan. 31, 1940, totaled \$135,905,000, excluding the floating debt variously estimated at 50,000,000 to 80,000,000 pesos. The funded debt on Feb. 28, 1939, was \$141,278,000. The Cuban peso, equivalent to \$1 (U.S. currency)

at par, had an average exchange value of \$0.98 in 1938, \$0.93 in 1939.

**Transportation.** Cuba in 1938 had 3130 miles of common carrier railway lines and 5781 miles of industrial (chiefly sugar plantation) lines. The 23 common carrier railways reported a combined deficit of 5,685,078 pesos in 1937-38. Highway mileage in 1939 was 2214 (see *ROADS AND STREETS*). Air traffic statistics on international lines serving Cuba were, for 1939: Passengers, 43,082; mail, 105,913; express, 75,785 lb. The merchant marine consisted of 39 steamers of 29,947 gross tonnage in July, 1939.

**Government.** Cuba at the beginning of 1940 was governed under the Constitution of June 12, 1935 (see *YEAR BOOK*, 1935, p. 189). A Constituent Assembly was elected Nov. 15, 1939, to draw up a new Constitution; it completed its work June 8, 1940 (see below). President at the beginning of 1940, Dr. Federico Laredo Bru. Formerly Vice-President, he was sworn in as President Dec. 24, 1936, following the impeachment of President Miguel Mariano Gómez. The dominant political power was Col. Fulgencio Batista, who became Chief of Staff of the army as a result of the so-called "sergeants' revolt" of 1933.

#### HISTORY

**Political Developments.** The promulgation on Oct. 10, 1940, of a new Constitution drawn up by a freely elected Constituent Assembly, and the election to the Presidency on July 14 of Col. Fulgencio Batista, the island's "strong man" who resigned as army Chief of Staff to enter the campaign, brought a considerable degree of order out of the political confusion that had prevailed since the overthrow of the Machado regime on Aug. 12, 1933.

**The New Constitution.** The controversies over the date of the general election and the powers of the Constituent Assembly (see *YEAR BOOK*, 1939, p. 176) were settled by a compromise agreement negotiated Feb. 5, 1940, by President Laredo Bru between the parties supporting Colonel Batista and the opposition coalition. It was decided to postpone the general election until May 18, to elect a complete new Congress, but to permit half the existing members of Congress to complete their terms.

This accord permitted the convening of the Constituent Assembly on February 9. On February 14 the opposition leaders, Dr. Ramón Grau San Martín, chief of the Cuban Revolutionary party, and Dr. Joaquín Martínez Sáenz, head of the ABC party, were elected president and vice-president, respectively, of the constitutional convention. On May 3 the Constituent Assembly extended its deliberations for three months beyond the time limit originally fixed. Agreement on the basic points of the new Constitution had been reached on February 22, but it was not until June 8 that the Constituent Assembly approved the last of the 318 articles of the organic law. The delegates signed the organic law on July 1 at a ceremony in the town of Guaimaro, Camagüey Province, where the island's first Constitution was signed on Apr. 10, 1869. It went into effect on October 10.

The Constitution provided for a President elected for four years; a Senate of 54 members (9 from each province) elected for six years, with one-third replaced every two years; and a House of Representatives containing 1 member for each 35,000 inhabitants (about 120), one-half the members

being elected every two years for four-year terms. The President as well as members of Congress and provincial and municipal officials are elected by direct popular male and female suffrage, which was made compulsory. Colonel Batista was specifically exempted from a clause barring the Presidential candidacy of anyone connected with the armed forces within one year of an election.

In many respects the Constitution resembled preceding Cuban fundamental laws. An important innovation was the establishment of a semi-parliamentary form of government, under which the President appoints a Premier who retains office only so long as he receives the support of a majority of the House of Representatives. Other provisions provided for an independent judiciary; the fair administration of justice; and restriction of political patronage through civil service rules preventing purges of public employees on political grounds.

The Constitution contained a complete code of social welfare and labor laws, establishing a 44-hour work week, a month's paid vacation for each employee annually, and a system of old age, unemployment and accident insurance. It barred all except naturalized Cubans from the practice of the professions, prohibited immigration of common laborers, established equal wages for men and women doing the same work, and empowered the government to fix minimum wages, settle labor disputes, and intervene in all questions affecting labor. The amount of land owned by individuals and corporations was restricted, capital punishment was abolished, and the mortgage moratorium in effect since 1934 was "liquidated" by a transitory provision cancelling accrued interest and allowing debtors to pay off their mortgages in 10 to 30 years at annual interest rates of from 1 to 3½ per cent.

Certain provisions of the Constitution aroused strong protests from Cuban business circles. They declared the additional costs imposed by the social welfare and labor code would force many businesses to close. The liquidation of the mortgage moratorium was challenged in the courts. A wave of unauthorized strikes to force employers to accept the labor provisions of the Constitution occurred during the last weeks of the year.

**The Elections.** At the beginning of 1940 Colonel Batista's chances of victory appeared none too bright. He was supported by the so-called Socialist-Democratic coalition of Liberals, Nationalists, Communists, National Democrats, and National Realists. But they had been defeated by the opposition parties in the Constituent Assembly elections on Nov. 15, 1939. And early in 1939 the opposition bloc united behind the popular ex-President, Grau San Martín, as Batista's opponent.

The wily army leader reversed the political situation and insured his election by making a political deal on March 18 with ex-President Mario G. Menocal, chief of the opposition Democratic Republican party. In return for Batista's pledge that Menocalistas would be nominated on the Socialist-Democratic ticket for Vice-President, mayor of Havana, three of the six provincial governorships, and 12 seats in the Senate, Menocal deserted Grau San Martín's coalition and threw in his lot with the Batista bloc. As the Democratic Republicans held the balance of power in the Constituent Assembly, this gave Batista's supporters control of that body also. On May 22 they elected Dr. Carlos Márquez Sterling and Dr. Simeón Ferro, both Batista adherents, to succeed Grau San Martín and

Martínez Sáenz as president and vice-president of the Constituent Assembly.

In order to keep his own party and other supporters in line during the complicated maneuvering for nominations and positions that preceded the election, Dr. Grau San Martín temporarily withdrew as the opposition candidate for the Presidency on April 25, but re-entered the contest five days later. During the campaign, fought largely on personalities, Dr. Grau San Martín's supporters charged Batista with using the army to intimidate their voters. They demanded the suspension of the elections in Camagüey and Matanzas Provinces and in parts of Havana and Pinar del Río. However the Supreme Electoral Tribunal suspended voting only in three or four small areas. Election day disorders were relatively minor, with about six persons killed and 40 wounded. Batista defeated Grau San Martín by a majority of more than 200,000 votes, and most of the government candidates won by a similar margin. Besides the President and Vice-President, members of the new Congress and municipal and provincial officials were chosen on July 14.

**The Batista Regime.** Despite opposition efforts to interpose legal obstacles, Batista was sworn in as President on October 10. His cabinet, announced October 8, was headed by Sen. Carlos Saladrigas, a follower of ex-President Menocal, as Premier. The 18 ministers were drawn from five of the seven parties forming the government coalition, the Communists and the small Popular party alone failing to gain representation.

The newly elected Congress was scheduled to convene in September, but the opposition bloc filed petitions with the Superior Electoral Tribunal seeking annulment of the elections in various provinces and in more than 40 municipalities. Consequently it was November 21 before both houses were finally seated and organized. On that date the government bloc controlling both houses elected Sen. Antonio Mendieta Beruff (Nationalist) as President of the Senate and Dr. Gustavo Gutiérrez Sanchez (Liberal) as President of the House.

The major problems facing President Batista and the new Congress were the adaptation of the country to the semi-parliamentary system established by the new Constitution; the adverse effects of the European War upon Cuban economy, the re-appearance of political terrorism, especially among students at the University of Havana; and Cuba's relations with the United States and the other American republics in the face of a growing threat from the European dictatorships.

The spread of the European conflict eliminated markets that normally absorbed 25 to 30 per cent of Cuba's exports. Norwegian and Danish ships handled a considerable part of the island's overseas trade, and the dislocation of their merchant marine operations by the war added to Cuba's economic difficulties. By July the price of sugar had fallen to about the 1934 level. Together with similar reductions in tobacco prices, this dealt a severe blow to Cuban purchasing power and increased unrest.

On September 14 the outgoing Congress authorized the negotiation from the United States Government of a loan or credit not exceeding \$50,000,000 to tide the country over the economic emergency. A commission was sent to Washington early in October to negotiate the loan, apparently without first consulting the State Department. It met with no success up to the end of the year and most

of the members of the mission returned to Cuba. Meanwhile, to strengthen Cuba's credit, Congress on September 16 passed legislation authorizing payment of the defaulted \$20,000,000 public works loan of 1931. The unused balance of \$9,883,500 from the \$85,000,000 bond issue authorized in 1938 was allocated for this purpose, together with a new \$9,000,000 4½ per cent loan.

On March 1 an attempt was made in Havana to assassinate Dr. Orestes Ferrara, former Ambassador to the United States. Prof. Ramiro Valdés Daussá of Havana University was murdered by a hostile student faction on August 15. Three students were killed and nine wounded in a shooting fray in Havana on September 30. The political assassination of Prof. Raúl Fernández Fiallo shortly afterward led the university council to close Havana University until Jan. 7, 1941. A series of student strikes in high schools throughout Cuba were interpreted as other indications of popular unrest.

President Batista also aroused opposition among some of his former army associates by carrying out his campaign pledge to eliminate military influence from his administration.

**Foreign Relations.** Despite the anti-American agitation carried on by Communists, Nazis, and pro-Franco elements, the economic and political repercussions of the European War drove Cuba into closer relations with the United States. During the Presidential campaign both Colonel Batista (January 6) and Dr. Grau San Martín (May 7) advocated close co-operation with Washington as necessary to Cuba's prosperity and stability. On May 23 Batista stated that while Cuba hoped to maintain her neutrality, "the United States can count on us as a factor in its plans for the defense of the Caribbean." On September 3 Dr. Grau San Martín asserted that Cuba would side with the United States if the latter became involved in the war. During September the United States sent 2900 marines to reinforce the garrison of the Guantánamo Bay naval base.

Communist, Nazi, and Falangist propaganda, directed mainly against the United States, grew more intense, particularly before the conference of American Foreign Ministers in Havana in July. With Batista seeking electoral support from both Communists and pro-Fascists, only half-hearted efforts were made to curb this agitation. Moreover on July 24 the government legalized the Cuban branch of the Falange Español, or Spanish Fascist movement, which was dissolved for "anti-Cuban activities" on Apr. 25, 1939. The Falangists gained ground rapidly among anti-Communist Spaniards in Cuba and among many Cubans.

There was a strong reaction against both Communists and Falangists during the latter part of the year. A small pro-Nazi party was banned by the Governor of Havana Province. Congress took steps to control the Communist-dominated Cuban Confederation of Labor. Criticism of the role of the Falange Español in Cuba reached storm proportions after Genaro Riestra, newly-appointed Spanish Consul General, arrived in Havana November 13. The anti-government bloc in Congress vigorously attacked the government for its toleration of "fifth columnists." The theft of documents from the office of Maj. H. D. Boydell, U.S. naval attaché at Havana, on November 30 furthered this agitation. On December 19 the Senate approved a motion urging the government to declare *persona non grata* foreign diplomats and consular officials

who used their immunity to spread anti-democratic propaganda.

See **INDUSTRIAL CHEMISTRY**; **PAN AMERICANISM**; **PAN AMERICAN UNION**.

**CURAÇAO.** A Netherlands West Indian colony consisting of two groups of islands (1) Aruba, Bonaire, Curaçao, just north of Venezuela (2) Saba, St. Eustatius, St. Martin (southern part only), just west of the Virgin Islands. Total area, 403 square miles; population (Jan. 1, 1939), 101,021. Capital, Willemstad (on Curaçao), 30,453 inhabitants.

**Production and Trade.** The chief products are maize, phosphate of lime, and cattle. Oil refining is the most important industry. Trade (1938): Imports, 391,130,326 guilders; exports, 340,545,295 guilders. Air services of the Royal Air Traffic Company of the Netherlands make connections with Pan American Airways to the United States and South America.

**Government.** Budget (1938): Revenue, 10,753,000 guilders; expenditure, 9,839,000 guilders (guilder averaged \$0.5501 for 1938). The colony is administered by a governor who is aided by a council of 4 members. There is a States council consisting of 15 members (10 elected by the voters and 5 nominated by the governor). Governor, G. J. J. Wouters (appointed Apr. 7, 1936).

**History.** On May 10, 1940, the Governor of Curaçao proclaimed martial law and the existence of a state of war with Germany immediately following the German invasion of the Netherlands. All Germans residing on the islands and the crews of German ships in the harbors (about 400 in all) were rounded up and interned on Bonaire Island. Efforts of the German crews to scuttle or burn their ships were in most cases prevented. Six vessels were seized in the port of Willemstad.

On May 11 British and French troops were landed on Curaçao and Aruba to aid the Dutch authorities in preventing "possible German attempts at sabotage in the important oil refineries of these islands." This action was said in a British Foreign Office announcement to have been carried out at the request of the Netherlands Government. It was emphasized that the British and French governments planned to withdraw their troops as soon as the Netherlands Government decided they were no longer needed and that consequently no question of infringement of the Monroe Doctrine was involved. Over one-third of all Great Britain's oil imports came from Venezuela and the refineries of Aruba and Curaçao. The U.S. State Department indicated on May 11 that it did not consider the Allied landings a violation of the Monroe Doctrine.

See **NETHERLANDS, THE**, under *History*; **EUROPEAN WAR**; **GREECE** under *History*.

**CURLING.** The ancient Scottish game of curling, transplanted in American soil, flourished with vigor throughout 1940. The Gordon International Medal, much-coveted prize, returned to Canada for the first time in two years when the combined rinks of the Dominion branch of the Royal Caledonia Curling Club took the first honors in Montreal.

Sixteen rinks from Canada and 16 from the United States entered the competition for a score of 215-177, with the Canadians in the ascendant. The Canadians were paced by Len Cushing of Royal Montreal. He also headed the team that wrested the Munson Shield from Utica, N.Y., where it had been reposing since 1932.

A Canadian-United States invitation bonspiel for

the Douglas Medal was held at the St. Andrew's Golf Club, Mount Hope, N.Y., and in the final of this event the Schenectady Curling Club's A rink, led by T. H. Lydgate, beat the St. Andrew's B team, 15-12.

Saranac Lake captured the Patterson Medal, while the Utica Curling Club's No. 2 rink and the Lake Mahopac, N.Y., club shared honors in the grand national bonspiel at Utica.

**CURRENCIES, Value of Foreign.** See **INTERNATIONAL BANKING AND FINANCE** under *Foreign Exchange*; also the individual countries under *Finance*.

**CUSTOMS, Bureau of.** The Customs Service, at the end of the calendar year 1940, finds itself an organization comprising 9016 personnel, of which 8805 are distributed throughout 46 customs collection districts of the United States (including one in Alaska, one in Hawaii, and one in Puerto Rico), in the Virgin Islands, and in foreign countries. Control of the Service is centralized in the Commissioner of Customs at Washington, D.C., who, with the assistance of the personnel of the Washington office, numbering 211, issues instruction and co-ordinates the activities of the widespread field. Charged primarily with the collection and protection of the revenue from imports, the Customs Service has been assigned numerous other responsibilities, such as enforcement of laws relating to vessels and navigation, regulation of traffic between the United States and foreign countries, supervision over and restriction of imports and exports, and enforcement of laws and regulations of certain other agencies in relation to articles in international traffic.

**Customs Collections.** After two successive years of declining revenues, customs collections in 1940 turned sharply upward. The total of \$350,851,561 was 9.2 per cent larger than in 1939 and only 2.5 per cent less than in 1938. The general increase in customs collections in 1940 is attributable entirely to four dutiable schedules of the tariff act: sugar, wool, metals, and beverages. The remaining 11 schedules yielded smaller revenues than during 1939. Collections on sugar and its products were 50 per cent larger than in 1939; on wool 66 per cent larger; on metals and manufactures of metal, 17 per cent; and on beverages, 12 per cent.

As might be expected, imports from Europe fell off considerably as a result of the war but the decline was not apparent in the earlier months of the year when huge stocks of European merchandise were being accumulated. Duties collected on imports from Belgium, Norway, Sweden, and Yugoslavia exceeded the amount collected in 1939 though exports from those countries to the United States were greatly reduced toward the end of the year. Particularly large decreases occurred in revenue on merchandise from Germany, Czechoslovakia, and Poland, while smaller declines were recorded in duties on imports from Italy, Greece, The Netherlands, Hungary, Bulgaria, and Denmark.

Although revenues from European imports declined, larger revenues were derived from imports from other regions. By far the largest increase in customs revenue during 1940 came from the products of Cuba and was due to the suspension of the quota and the consequent increase in the rates of duty on Cuban sugar. Greatly increased revenue was received also from imports from the Union of South Africa, The Netherlands East Indies, Uruguay, and Chile. Heavy receipts of wool from

Uruguay and the Union of South Africa accounted for the increased revenues on imports from those regions and a large increase in direct importations from The Netherlands East Indies offset decreased importations from the mother country.

The value of dutiable imports entered for consumption and withdrawn from warehouse for consumption during the year was \$919,709,163, 12 per cent larger than during the preceding year, the rate of increase being slightly greater than for customs receipts. The value of imports entered free of duty showed an even larger percentage of increase, 21.5 per cent, and consequently their proportion of the total value of imports entered for consumption in 1940, 62 per cent, was greater than in the previous year, 60 per cent. The estimated duties collected for the fiscal year 1940 totaled \$340,005,668, as compared with \$312,095,152 for 1939. The largest amounts, by countries, were collected as follows: on imports from Cuba, \$60,589,808; United Kingdom, \$44,020,551; Argentina, \$21,340,331; Canada, \$20,284,082; France, \$19,124,320; Japan, \$17,896,589. For statistics on imports (including duty-free articles) from the principal countries, see TRADE, FOREIGN.

**Volume of Business.** Despite the increase of customs receipts, less entries were filed for imported merchandise in 1940 than during the previous year. Only warehouse and rewarehouse entries were more numerous in 1940. The total number of entries of all kinds filed in 1940 was 2,681,500, a decline of 386,298 from the 1939 total. Warehouse and rewarehouse entries in 1940 numbered 68,469, an increase of 4351 over the total of the previous year. While, ordinarily, customs collections will closely parallel fluctuations in the volume of entries filed, the unusual feature that imports of sugar and wool rose out of proportion to the merchandise in other tariff schedules made possible an increase of revenue out of fewer entries. Sugar and wool were entered in large lots, comparatively few entries being required, but the revenue per entry was much greater than for most other goods.

A sharp reduction in the number of baggage entries resulted from reduced tourist travel. Mail entries in 1940 showed even a sharper decline due to the difficulty of communication with many European countries. Appraisement entries which were numerous in 1939 as the result of the receipt of a large quantity of personal effects of European refugees returned to their normal number.

The expansion of exports brought about an increase of 4378 drawback notices of intent over the number filed in 1939. The number of drawback entries was only slightly smaller than in 1939, while, as the result of the expansion of exports, and pursuant to notices of intent filed in 1940 and previously, the amount of drawback paid increased by \$2,699,315 to \$14,041,580. About 98 per cent of the drawback allowed consisted of drawback on exported merchandise manufactured from imported materials, the most important of which were sugar, flaxseed, and copper.

Customs officers were called upon during the fiscal year to examine baggage and other belongings of 48,552,327 persons arriving in the United States from vessels, vehicles, and aircraft, and on foot. This entailed the examination of 11,508,907 automobiles and buses, containing 32,256,533 passengers; 34,331 documented vessels carrying 733,338 passengers; 29,946 undocumented vessels with 116,628 persons on board; 33,502 passenger trains bringing 1,094,023 passengers; 8359 aircraft with

78,542 persons; 114,041 ferries carrying 2,042,528 passengers; and 438,964 streetcars and other vehicles which brought in 1,633,277 persons. Pedestrians crossing the border into the United States numbered 10,597,458. Particularly outstanding was the increase by almost 50 per cent over last year of passengers arriving from abroad in aircraft.

**Import Restrictions.** Import and tariff quotas and exchange control measures can be more restrictive trade barriers than a highly protective tariff. They may be used to control trade balances, to apply retaliatory measures, or to limit the extent of a special benefit conferred upon foreign producers. In this country import and tariff quotas have been established pursuant to reciprocal trade agreements and under presidential proclamations and statutes to limit the total quantity of certain commodities which may be imported within quota periods and to fix limited quantities of certain other commodities which may be imported at reduced rates of duty, or free of duty. Exchange control methods, adopted in profusion by European countries, were not used here. To the quotas established under the trade agreements with Canada and the United Kingdom, the Philippine Independence Act, and the Philippine Cordage Act, there were added during the fiscal year a quota on crude petroleum and certain petroleum products under the trade agreement with Venezuela, effective Dec. 16, 1939, a quota on Cuban filler and scrap tobacco, effective Jan. 1, 1940, under the supplementary trade agreement with Cuba; a quota on black and silver foxes and furs under the supplementary trade agreement with Canada, effective Dec. 1, 1939; quotas on certain types of unmanufactured cotton and cotton waste, effective for the 12-month period after Sept. 20, 1939, under a proclamation by the President on Sept. 5, 1939; and a duty free quota on red cedar shingles provided by the Act of July 1, 1939. An amendment to the Philippine Independence Act established, in addition to the quotas previously in effect, quotas on imports from the Philippine Islands of cigars, scrap and filler tobacco, and pearl or shell buttons, effective Jan. 1, 1940.

Other means for restricting imports are anti-dumping duties and countervailing duties. Dumping may be defined as the sale for export at a price below that prevailing in the domestic market to the prejudice of industry in the importing country. During the fiscal year five findings of dumping were issued and seven findings partially revoked. The findings issued applied to wool-knitted berets from France and to ribbon fly catchers from the United Kingdom, Japan, Belgium, and Germany. The findings revoked related to importations of safety matches from Finland, Austria, Latvia, The Netherlands, Norway, Poland, and Estonia. Only one order imposing countervailing duty was issued during the fiscal year. This applied to certain cheddar cheese from Canada.

**Enforcement of Customs Laws.** Seizures for violations of the customs laws were fewer in number and smaller in value than during 1939. The aggregate value of seized articles, including boats, automobiles, airplanes, and horses was \$1,254,334 against \$1,873,130 for the previous year. In addition to the goods which were seized, claims aggregating \$8,467,828 were initiated against importers in connection with various irregularities and frauds which either did not necessitate a seizure or were discovered after the goods had gone into consumption. Collections from fines, penalties, liquidated

damages, and sales of seized goods aggregated \$878,387.

**Neutrality Activities.** The Customs Service, following the outbreak of hostilities in China and later in Europe, has been busy with measures to prevent shipments of merchandise from the United States in violation of the Neutrality Act and regulations. A much heavier volume and value of exports resulted from the need of the belligerent powers for various materials. The number of export declarations in 1940 reached a total of 4,280,109 compared with 3,816,673 in 1939, and the value of exports totalled \$3,829,000,000 compared with \$2,920,000,000 in the previous year. Customs examination both of the documents and of the actual shipments was required in order to prevent the exportation of prohibited commodities and to insure against involvement of the neutral status of the United States by outgoing vessels.

**Cost of Administration.** The total revenues collected by the Customs Service during the year, including collections for other departments, amounted to \$383,279,575, an increase of \$32,883,631 from the previous year. Expenses of administration were increased by \$343,400 in 1940 but, as a result of the increased collections, the cost to collect \$100 was only \$5.51 during the past year compared with \$5.93 in 1939.

W. R. JOHNSON.

**CYCLING.** Because of the war, world championships in bicycling were not contested in 1940. The respective titles therefore remained in the hands of the 1939 winners, Arie Van Vliet of the Netherlands retaining the professional sprint title and Jan Derkens, another Dutchman, continuing as the amateur sprint king.

Gustav Killian, German "good-will" cyclist to the United States, outpedaled Tino Reboli of Newark for the national professional motor-pace crown, and Mickey Francoise of Montclair, N.J., displaced George Shipman as the national professional sprint king.

In the national amateur spring classic, Buster Logan of Arlington, N.J., took first honors. Ed Carafagnini of Chicago won the A.A.U. senior title and Chuck Edwards, another Chicagoan, captured the junior A.A.U. title.

For the first time in many years, there was no six-day bicycle race in New York.

**CYCLOTRONS.** See PHYSICS

**CYPRUS.** A British crown colony in the eastern Mediterranean Area, 3572 square miles; population (1938), 376,529. Chief towns: Nicosia (the capital), 23,677 inhabitants; Limassol, 15,349; Larnaca, 11,872; Famagusta and Varosha, 9979; Paphos, 4517; Kyrenie, 2137. Most of the inhabitants profess the Christian faith. Mohammedans make up about one-fifth of the population.

**Production and Trade.** The chief products are wheat, barley, olives, cotton, raisins, carobs, potatoes, linseed, wine, olive oil, cupreous pyrites, asbestos, gold, chrome iron ore, gypsum, and terra umbra. Trade (1938): Imports, £2,246,435; exports, £2,478,256. Shipping entered and cleared during 1938 aggregated 2,995,650 tons.

**Government.** Budget estimates (1939): Revenue, £920,494; expenditure, £974,468. Budget for 1940: Balanced at £996,176. Public debt (Dec. 31, 1938): £822,300. As a result of the political disturbances of 1931 the legislative council was abolished (see YEAR BOOK, 1931) and the governor was granted the power to legislate. The executive

council was retained. During 1933 an advisory council was established to advise the government on legislative and other measures. Governor and Commander-in-Chief, W. D. Battershill (appointed Feb. 21, 1939).

**History.** The leaders of all political parties informed Governor Battershill that they would suspend political agitation until after the end of the war. During April, 1940, it was announced that nearly 12,000 men had volunteered for military service. The Cypriot Transport was the first colonial contingent to serve with the British Expeditionary Force in France. Reports were issued stating that municipal elections, which had been suspended since 1935, would be resumed in 1941. The regulation of trade was covered by a number of orders which prohibited the import and export of goods except under licence. On June 14, 1940, at Nicosia, the formation of the Cyprus Volunteer Force, to assist the regular forces in the defense of the island, was ordered. The emergency measures taken on Italy's entry into the war included regulations providing for the control of wireless, the use of cameras, propaganda, and the detention and arrest of subversive elements. See ARCHAEOLOGY

**CYRENAICA, Battle of.** See EUROPEAN WAR under *British Victories in Africa*.

**CZECHO-SLOVAKIA.** A former Central European republic (capital, Prague), partitioned among Germany, Poland, and Hungary in 1938 and 1939, with the exception of part of Slovakia which became a nominally independent republic under German protection, with its capital at Bratislava. The manner in which the Czecho-Slovak republic was partitioned was described in detail in the 1938 and 1939 YEAR BOOKS and is summarized in the accompanying table.

PARTITION OF CZECHO-SLOVAKIA

Territory annexed	Date of cession or seizure	Area, sq. mi.	Estimated pop. 1939
To Germany:			
Sudetenland .....	Sept. 29, 1938	11,071	3,653,292
Bohemia-Moravia .....	Mar. 16, 1939	19,058	6,804,875
To Poland:			
Teschen district .....	Nov. 1, 1938	419	241,698
To Hungary:			
Parts of Slovakia and Ruthenia <sup>a</sup> .....	Nov. 2, 1938	4,566	1,027,450
Remainder of Ruthenia.	Mar. 14, 1939	4,283	552,124
Additional Slovak districts .....	Apr. 4, 1939	683	80,933
Slovakia, Republic of .....	Mar. 14, 1939 <sup>b</sup>	14,165	2,369,163
Total .....		54,245	14,729,535

<sup>a</sup> Returned in part to Slovakia by Germany on Oct. 21, 1939.  
<sup>b</sup> Carpatho-Ukraine. <sup>c</sup> Date of Slovak declaration of independence.

The Sudetenland was annexed as an integral part of the German Reich. Hungary similarly incorporated in its national territory the districts acquired from Czecho-Slovakia. Bohemia and Moravia were established as a German protectorate, while Slovakia on Mar. 18, 1939, signed a treaty with the Reich accepting German protection. The Reich Protectorate of Bohemia and Moravia and the Slovak Republic were not recognized by the governments of France, Great Britain, the United States, and other powers.

**Czecho-Slovak Provisional Government.** Upon the outbreak of war between Germany and the Allies in September, 1939, the group of Czech and Slovak political leaders in exile, headed by Dr. Eduard Beneš, established headquarters in London and on September 8 Dr. Beneš declared

war on Germany in the name of the Czech people. Under an agreement made with the French Government on Oct. 5, 1939, a Czecho-Slovak army was created "under the authority of the Provisional Czecho-Slovak Government" to fight with the Allies. On Nov. 17, 1939, a Czecho-Slovak National Committee was formed in Paris. It was recognized as the legal "government in exile" of Czecho-Slovakia by the French Government on the same day. The membership comprised five Czechs and three Slovaks, headed by Dr. Beneš. The Committee declared "null and void" the agreement signed in Berlin Mar. 15, 1939, between Chancellor Hitler and President Hacha of Czecho-Slovakia.

In February, 1940, the British Government and the three leading political parties declared that restoration of Czecho-Slovak independence was one of Britain's war aims. The French Government was reported to have made a similar pledge, and the objective received the support of the Polish Government-in-Exile. On the other hand the Hungarian Foreign Minister, in a statement before Hungary's parliament on Mar. 6, 1940, announced his government's opposition to restoration of the Czecho-Slovak Republic.

**Recognition by Britain.** Upon the collapse of France, the Czecho-Slovak government leaders and many of the Czecho-Slovak troops in France escaped to England. On July 22 the British Government formally recognized "the Provisional Czecho-Slovak Government established by the Czecho-Slovak National Committee." Dr. Beneš, as President of the Provisional Government, immediately formed a cabinet in which Mgr. Jan Sramek became Premier and Jan Masaryk, son of the founder of Czecho-Slovakia, Foreign Minister. On December 10 President Beneš announced the establishment in London of a State Council of 40 members, including representatives of all Czecho-Slovak political parties, to serve as a provisional parliament until the end of the war. Rudolf Bechnyes was appointed president of the Council.

There was objection among some Czecho-Slovak exiles to the inclusion in the government and Council of representatives of the Czecho-Slovak Agrarian party, which forced Czecho-Slovakia to accept Hitler's demands for the Sudetenland during the crisis of September, 1938 (see YEAR BOOK, 1938, p. 196). One minister had also served the Hacha puppet government in Prague before escaping to France. Agitation over the composition of the government and the alleged anti-democratic bias of army officers led to dissension in the Czecho-Slovak military camp in England during the autumn. At the request of the Czech authorities, the British arrested over 500 soldiers and interned a former Communist deputy in the Czecho-Slovak parliament. The bulk of the mutinous soldiers were enlisted in the British Pioneer Corps.

A military agreement concluded by the British and Czecho-Slovak governments on October 25 gave the Czech military authorities full jurisdiction over their troops on British soil and enabled them to restore discipline. The Czecho-Slovak armed forces were organized under their own commanders for service with the Allied armies under British direction. Air units were attached to the Royal Air Force. Britain undertook to finance the organization and maintenance of the Czecho-Slovak forces. The Beneš Government was authorized to conscript Czecho-Slovak citi-

zens in the United Kingdom and recruit volunteers abroad.

On the second anniversary of the Munich Accord of Sept. 29, 1938, Prime Minister Churchill declared that the restoration of Czecho-Slovak liberties was one of Britain's principal war aims. In a radio address on December 7 Foreign Minister Masaryk upheld the British blockade of the continent, asserting that the Czecho-Slovaks preferred the serious food shortage caused by "the combined effect of German oppression and the British blockade" to the destruction of their souls.

A pledge of friendship between the Czecho-Slovak and Polish people during and after the war was exchanged between their respective Provisional Presidents in London on October 9. On November 11 the two governments-in-exile issued a joint statement declaring their intention after the war to enter as independent, sovereign states into a closer political and economic association that would serve as the basis for a "new order" in Central Europe.

For internal developments in BOHEMIA AND MORAVIA AND SLOVAKIA, see those articles.

See JEWS; LABOR CONDITIONS.

**DAHOMY.** See FRENCH WEST AFRICA.

**DAIRYING.** A record high in milk production, strong consumer demand for both fluid milk and manufactured products, abundant feed supplies, butterfat-feed price ratios favorable to the dairy producer, a narrow margin between retail prices of manufactured products and prices paid to farmers, unusually low cold storage stocks of butter and a generally favorable outlook for 1941 characterized the dairy situation at the close of 1940.

Numbers of milk cows, which have steadily increased since 1937, reached 25,334,000 at the beginning of 1940, with a further increase of about  $\frac{1}{2}$  million head indicated for the year. With generally favorable pasture conditions throughout the summer and fall, and supplies of feed grains, protein concentrates and hay above 1939 levels, a relatively high level of milk production per cow persisted to the end of the year. Total milk production for the year approached 111 billion lb., about 2 per cent larger than a year earlier. Local market prices of butterfat in mid-December averaged 34.8 cents per lb., the highest since December, 1937. At this figure the butterfat-feed grain price ratio was similar to the long time (1920-34) average and decidedly more favorable to the dairy producer than that of preceding months.

Prices paid to producers for butterfat and milk used in dairy manufactures averaged about one-third lower than in 1924-29 but, because the margin between retail prices and prices paid to farmers was only 66 per cent as large as in 1924-29, the farmer received as large a proportion of the consumers' dollar in 1940 as during the era of higher prices. In June, 1940, the U.S. Department of Agriculture approved a program for 1940-41 under which the Dairy Products Marketing Association was enabled to continue butter market stabilization operations. A \$7,000,000 loan approved by the Commodity Credit Corporation made possible the buying and storing of butter, up to 25 million lb. Comparatively little butter was purchased under this plan, cold storage holdings of the Association on Jan. 1, 1941, totaling only 66,000 lb. Purchase of dairy products for relief purposes during 1940 was far below that of earlier years, when relief output reached 5 per cent of the total trade output. Heavy purchases of butter

were made under the Food Stamp Plan. Near the end of the year about 2,000,000 lb. were being distributed monthly in this manner in the 253 areas where the stamp plan was operated.

According to estimates by the U.S. Department of Agriculture, production of the principal manufactured products near the end of 1940 was about 12 per cent higher than a year earlier. Butter, cheese, and evaporated milk production was up 11, 13, and 19 per cent respectively. Sharp reduction in cheese importation and large exports of condensed and evaporated milk stimulated the production of these products as compared with butter. Total production of manufactured dairy products for 1940 was certain to exceed the 1939 level when a fluid milk equivalent of 51,230 million lb., or 47 per cent of the total milk produced, was used for this purpose. Also, the apparent consumption of manufactured products was 11 per cent higher than a year earlier. Consumption of domestic cheese had increased enough to largely offset the decline in cheese imports which made up 8 per cent of the total consumption in 1939.

Total cold storage holdings of butter on Jan. 1, 1941, were 41,590,000 lb. as compared with 55,462,000 lb. a year earlier and the 1936-40 average of 65,707,000 lb. Of this total, only 81,000 lb. were owned by government agencies against 14,875,000 lb. in 1940. All types of cheese in cold storage on this date totaled 128,413,000 lb., about 19 per cent larger than a year earlier. Stocks of evaporated milk were also relatively high.

**World Conditions.** Both production and distribution of dairy products in European Countries during 1940 were seriously disturbed by war conditions. Without exception, the principal dairy producing countries, which normally import large quantities of feedstuffs, were experiencing a shortage of feed accompanied by a sharp decline in milk production. Most countries were rationing butter while surplus milk supplies were being diverted to cheese and condensed milk production rather than to butter. Fresh milk consumption was being controlled chiefly by price although some countries were rationing their supplies. Germany, with the important exports of Denmark, Holland, Sweden, and Switzerland at her command, was in a better position than most of the other countries.

The United Kingdom, normally the most important deficit country in the world in dairy products, was experiencing a milk shortage at the close of the year. Domestic production was far below normal, due mainly to feed shortage, Irish production had declined because of drought and imports from the Continent were eliminated. Butter and cheese were being supplied in fairly adequate amounts from the Empire countries where production generally was above normal. Australia and New Zealand were under contract to supply stipulated quantities of these products during the 1940-41 season. Canada was exporting large quantities of cheese to the mother country and was under contract to supply not less than 112 million lb. during the year beginning Apr. 1, 1941. Far-above-normal quantities of evaporated milk were purchased from the United States during the year.

Of great interest to the purebred cattle breeders of this country, was the German occupation, in June, 1940, of the Channel Islands of Guernsey and Jersey, native homes of Guernsey and Jersey Cattle. Significant numbers of breeding animals have been imported to the United States annually from the Islands. The destruction of these "foun-

tain-heads" would be an irreparable loss to the dairy cattle breeding industry.

**Foreign Trade.** The import-export balance of edible dairy products changed sharply in 1940 as compared to that of the previous year, primarily due to a marked reduction in imports of European cheese and a large increase in the export of evaporated milk.

Exports for the year 1940, totaled \$16,919,882 as compared with \$7,136,322 for the corresponding period in 1939. Total imports were \$7,838,397 in 1940 and \$13,257,017 in 1939. Imports of commercial casein, mainly from Argentina, exceeded 1 million dollars in 1940, an increase over 1939. Large shipments of Italian-type cheese from Argentina reached this country near the end of the year.

**Miscellany.** On Jan. 1, 1940, there were 27,948 dairy herds consisting of 676,141 cows on test in dairy herd-improvement associations. In 1939 these cows produced 7977 lb. of milk and 323 lb. of butterfat on the average, whereas all cows milked in the United States averaged only 4538 lb. of milk and 179 lb. of butterfat per year. Cows producing at the general average rate consumed \$1.06 worth of feed per hundred lb. of milk produced while those that averaged 7977 lb. consumed only 79 cents worth of feed per hundred lb. of milk produced.

E. C. ELTING.

**DAKAR.** See EUROPEAN WAR; FRENCH WEST AFRICA.

**DAMS.** Practically all types of dams are represented in the numerous hydraulic development projects now under way by various governmental bodies and private corporations for domestic water supply, irrigation, power, and flood control or river regulation. Failure of a number of small dams in New Jersey during sudden storm floods in September, with consequent serious loss and damage to property, again indicates the necessity of competent State regulation and supervision of even small dams, including those built privately for recreation purposes.

**Concrete.** The U.S. Bureau of Reclamation (q.v.) now has under construction four of the five largest concrete dams in the world: the Grand Coulee, the Shasta, the Friant, and the Marshall Ford. All are of the gravity type, although the Shasta Dam is curved. In height, the Boulder Dam (arch type, completed in 1936) holds the record with 726 ft., but in volume of concrete it ranks third. The accompanying table compares these five great dams:

LARGEST CONCRETE DAMS

Name	Height ft.	Length ft.	Volume 1000 cu yds.	River	Location
Boulder (1936)	726	1,282	3,252	Colorado	Ariz.-Nevada
Shasta	560	3,500	5,400	Sacramento	California
Grand Coulee	553	4,300	10,200	Columbia	Washington
Friant	300	3,430	1,900	San Joaquin	California
Marshall Ford	270	2,623	1,864	Colorado	Texas

All the dams built by the Bureau are primarily for irrigation, but many of them serve also for other purposes. An exception is the Marshall Ford dam, which is primarily for flood control. The Grand Coulee dam on the Columbia River (nearing completion in 1941), the most massive masonry structure ever built, has the crest of its spillway or overflow section topped by a row of eleven elec-

trically operated steel drum gates, each 135 ft. long and 28 ft. high. These gates are to regulate the flow from the reservoir, and they increase the normal capacity of the reservoir by the extra depth of 28 ft. The Shasta dam, for the Central Valley project in California, had the concreting begun in July, 1940. A feature of its construction plant is a series of belt conveyors totaling 9.6 miles in length, to transport sand and gravel for the concrete. The Friant dam is for the same project. The Marshall Ford dam is one of a series of five dams for flood control and power development on 300 miles of the Colorado River above its mouth.

Of a different type is the Pensacola dam on the Grand in Oklahoma, which was completed in 1940 by the Grand River Authority. In March, Governor Phillips ordered out the State troops to halt construction forcibly until certain desired concessions were made as to rebuilding roads that would be submerged. But the courts decided against him and he had to back down. (See OKLAHOMA.) The dam is 147 ft. high, with a length of 5595 ft. and is composed of 51 inclined arches or semi-cylinders of 60 ft. span between the piers. In height, it is exceeded by the 270-ft. Bartlett dam on the Verde River in Arizona, completed in 1939.

Of still another type is the hollow slab-and-buttress concrete Possum Kingdom dam now being built on the Brazos River in Texas. Its piers or buttresses, 40 ft. apart, are sloped at the upstream end to support an inclined slab of concrete which forms the face of the dam. For the spillway or overflow the piers are sloped also at the downstream end to support a similar but steeper slab. This dam is 190 ft. high and 2740 ft. long. The Austin dam, on the lower Colorado River, in Texas, completed for the third time in 1940, was the largest concrete dam when first built in 1893. It failed in the flood of 1900, was repaired and rebuilt in 1915, but failed again the same year. In 1938, it was taken over by the Lower Colorado River Authority, which has rebuilt and enlarged it for flood control and power development.

**Earth.** The world's largest dry-fill earth dam is the Hansen dam now under construction on a tributary of the Los Angeles River, for flood protection. It is 120 ft. high and 9500 ft. long, containing nearly 15-million cu. yds. In size it is exceeded only by four earth dams of the hydraulic-fill type, in which earth and water are pumped to form the dam: Fort Peck, Kingsley, Gatun, and Sardis. It is one of several dams being built by the U.S. Engineers (q.v.) for flood-protection and power projects. These include the Denison dam on the Red River, in Texas, to be completed in 1944; the John Martin dam on the Arkansas River in Colorado (1943), and the Sardis dam on the Little Tallahatchie River, in Mississippi, which was put in service on Aug. 8, 1940.

Three earth dams were completed by the U.S. Bureau of Reclamation in 1940: Grassy Lake dam, 120 ft. high, in Wyoming; Fresno dam in Montana, 71 ft. high; and Crane Prairie dam, 40 ft. high, on the Deschutes River in Oregon. Four similar dams under construction are the Green Mountain dam on the Colorado and Big Thompson project in Colorado, a combined earth and rock fill 270 ft. high; the Vallecito dam, 150 ft., on the Pine River, Colorado; the Deer Creek dam, 240 ft., on the Provo River in Utah, and the Wickiup dam, 100 ft. high, on the Deschutes River in Oregon.

Of the several new and old dams included in the project of the Tennessee Valley Authority (q.v.),

three were completed in 1940: the Guntersville and Chickamauga dams on the Tennessee, and the Hiwassee on the Hiwassee River. Two were begun: Fort Loudon on the Tennessee River, and Cherokee on the Holston River. Two others still under construction are the Kentucky and Watt's Barr dams on the Tennessee River. All are to be completed by 1945. Besides power development and flood control, this comprehensive project includes the provision of a 9-ft. navigable channel in the Tennessee from the Ohio River to Knoxville, Tenn., 650 miles.

Two long earth dams being built by both dry fill and hydraulic fill methods in South Carolina will form reservoirs on the Santee and Cooper rivers, and a channel connecting the two reservoirs will divert the water of the former into the latter river, giving a drop of 72 ft. for power development. Barge navigation is also provided for. Studies for a dam in the St. Lawrence River, near Massena, N.Y., were commenced in October, 1940, by joint authority of the United States and Canadian governments. It is planned to develop 2,000,000 h.p. in electrical energy, and to cost some \$235,000,000. This project is the target of much controversy as to its merits for power and navigation purposes.

**Foreign.** Of foreign dams, the Kalkfontein dam in South Africa, completed in 1940, ranks second to the Vaalbank dam, which is 165 ft. high above the river bed or 230 ft. above the lowest part of the foundation. The Kalkfontein dam is of the rock fill type, with a maximum height of 113 ft. and a length of 10,400 ft. With 60 miles of distribution canals it will provide irrigation for the Jacobsdal district. While earth dams require an impermeable core wall to prevent percolation of water, the factor of earthquake shocks led to the design of a flexible core wall for a dam for the water supply of Rangoon, Burma. By means of a structure of interlocking concrete panels, it is expected that the dam may be bent considerably out of line without breaching the core wall. See **AQUEDUCTS**; **FLOOD CONTROL**; **WATERWAYS**.

**DANISH LITERATURE.** See **SCANDINAVIAN LITERATURE**.

**DANZIG.** A territory including the Baltic port of Danzig at the mouth of the Vistula River, which was detached from Germany and constituted a Free City under the protection of the League of Nations by Article 102 of the Treaty of Versailles, effective Nov. 15, 1920. It was reincorporated as an integral part of the Reich at the outbreak of the German-Polish war on Sept. 1, 1939. Area of the Free City, 754 square miles; population (1939), 415,000 including 266,000 in the city of Danzig. Head of the civil administration in 1940, Albert Foerster, Nazi party leader in the district. For statistics and other data on Danzig previous to its reunion with Germany, see **YEAR BOOK**, 1939, p. 189.

**DEFENSE LOANS.** See BANKS AND BANKING; RECONSTRUCTION FINANCE CORPORATION.

**DEFENSIVE PREPARATIONS, U.S.** The United States started in 1940, on a scale unexampled in peace and rivaled only by its armament in 1916-18, to increase its means of making war. The scope of the preparations covered, as far as possible, all that would conceivably belong to the subject. The main heads of the program were the establishment of conscription (see DRAFT, MILITARY); the increase of the personnel of the regular Army, Navy, and Marine Corps by voluntary enlistment, the large addition (under the two-ocean plan) to the naval force (see NAVAL PROGRESS under *United States*); the manifold augmentation of the chief types of airplanes of war; the creation not only of stores of fighting material but also of industrial establishments needful thereto; the devising of taxes and plans for public debt to meet a cost approximating the whole Federal income for several years; the accumulation of stores of materials that could not be produced within the country; and the knitting of useful foreign relations, particularly with the other American republics and the chief surviving democratic European belligerent, Great Britain. The plans for armament required at least two years and possibly longer for their accomplishment.

The most generally recognized purpose of this capital undertaking was to discourage and if necessary to overcome possible attack on the part of one or more of the several conquest-seeking dictatorial governments that were at the moment making headway toward mastery over the Old World. President Roosevelt led in initiating the program. Some of his critics charged him with designing and, by armament, preparing the entry of the United States into the war in Europe; others suggested political purposes as in his mind. The Republican party and, indeed the voters as a whole, accepted his stated reasons as the true ones. The President, shortly before the election, stated his policy as to increasing the defenses and asked a "vote of confidence" (see ELECTION, NATIONAL), thus giving that character to the vote for him.

Increases in armaments had been authorized by Congress early in 1940 before the appearance of the great program; they had seemed huge till dwarfed by the new plans. At the outset of May, armament under the earlier plans of 1940 and the Act of 1938 seemed ample for more naval vessels, airplanes, and flying fields; it bulked large enough, to the judgment of the moment; Congress had granted substantially what the President had asked. He was reported as satisfied, or wishful, that it should adjourn. The sudden conquest of Holland, Belgium, and France, wholly unexpected, changed the whole foreign scene within a few weeks. It startled the American people, crushed their sense of secure aloofness, and dumfounded most the numerous advocates of American isolation from "the Old World's quarrels." There came into the common thought a consequent apprehension that the United States might be marked for the next prey—not, perhaps, for invasion of its own territory yet quite possibly for enterprises against Latin America or territory in the Pacific, constituting indirect attack.

**The President's Proposals.** The President's requests on behalf of defense fall into two groups: Those in the budgetary message of January 4, as augmented by supplementary appropriation up to May, and the series that started with his special message of May 16; on requests prior to that date Congress voted about \$1,800,000,000 for the Army and Navy; on requests between May 16 and the pre-election recess Congress, with remarkable approach to unanimity voted a series of bills appropriating and authorizing contracts for defensive expenditure to the combined total of about \$16 billion more.

The main recommendations met therein were: Message of May 16, \$1,182,000,000; requests of May 31, \$1,277,000,000, chiefly for putting the National Guard and Reserve into active service; requests for 3000 airplanes and an increase of personnel for the Navy, \$1,492,000,000; President's endorsement of the two-ocean Navy bill, \$4,000,000,000; his message (mentioned above) of May 16 proposed to Congress, without indicating the cost, the construction of 50,000 warplanes, and Congress made heavy grants toward that object in different bills. The cost of the draft and of maintaining 800,000 of the drafted men in military training for a year and of providing quarters for them led Congress to provide over \$1,000,000,000. No one expected that the money provided for augmenting the fleet would all be spent before several years had passed; it would apparently take considerably more than a year to provide the Government with anything like 50,000 warplanes: Consequently the commitments for defense would spread out much of their weight over a succession of years. What part of it would appear in the deficit for the fiscal year 1941 remained uncertain.

Presented piecemeal to Congress and the people, the plan for increased defense bore something of the appearance of improvisation; whether it concealed any of improvisation's shortcomings did not at the outset appear. The collaboration of leaders in the upper organizations of Army and Navy, professionally trained in the problems of armament, made the risk less than it would have been in hasty commitments in other fields.

**Directions of Defensive Effort.** Most conspicuous of the features of the preparations for stronger armament, the creation of a host of air-

planes more powerful than any others in existence, met the condition brought into view by current evidence of aviation's prominent service in the German offensives. Possibly yet more important was the Government's effort to augment the Naval fleet to a power adequate to keep enemies from the Atlantic and the Pacific coasts simultaneously. The lately demonstrated success of the tank as a means of overthrowing armies decided the Government to increase its force of tanks to many times the actual number. Apart from these increases in material and the accompanying increase in actual weapons, the program of armament looked to a corresponding increase of fighting manpower; it sought to put over 1,000,000 men into active land service as soon as might be; it was to build up a sufficient reserve to provide 4,000,000, in a few years, if needed for service on a full wartime footing.

Ships, planes, tanks, weapons, and properly trained and organized men to use them were to be the ultimate products of the defensive effort. Equipment had to be manufactured in quantities so great as to occupy a substantial part of the Nation's industrial capability for a considerable time. The Government had to call upon industry to produce, without ceasing to serve normal economic needs, an additional output forming a high excess over industry's ordinary yearly total. To insure the desired production, much beyond the means of the existing makers of armaments, and at the same time avoid checking the delivery of armament ordered by Great Britain, the Government had to promote the development of new manufacturing establishments. Equally, its efforts necessarily included precautions against the shortage of any of the indispensable raw materials, in some cases not indigenous; thus, tin, hitherto got from British smelters, was to be mined in Bolivia and smelted in the United States. Nor did the defensive program end with raw materials and production. There remained the procurement and improvement of all manner of sites for the additional armaments, from cantonments to naval bases. In still another field the success of the program of defense required economic and military material assistance to other governments able to help in defense as the United States planned it—defense against European aggression for all the Americas.

**Central Organization.** Some kind of central authority had to watch over the whole work of armament, to see that superable obstacles should not cause great delays nor that one part of the undertaking should interfere with another. In the first stages of the program at least, the direction of the plans as an entirety remained with the President. As to their most laborious part, that concerned with production, a National Defense Advisory Commission (q.v.) was formed, of men of high rank in the industrial world, to help in correcting such troubles as might arise in the production of the required material. By December some at least of the leaders in the Federal effort to put order and speed into the movement of defensive production became convinced that they needed for this work a more effective instrument. The heads of the War and Navy departments submitted (about December 16) to the President a suggestion that he appoint a board of three with authority to manage the general features of all production for the defensive preparations. The President accepted the idea in the main, but modified it by raising the proposed board's member-

ship to four, so as to include a voice for labor. President Roosevelt accordingly created (December 20) the Office for Production Management for Defense and nominated as its members William S. Knudsen (Director), Sidney Hillman (Associate Director), Secretary of War Stimson, and Secretary of the Navy Knox.

**Status of Producers of Armament.** Private enterprises got the task of producing a great part of the projected warships and virtually all the bodies, engines, and equipment for warplanes and tanks. The Government's own navy yards had their hands full, largely with the construction of 35,000-ton and 45,000-ton battleships; its military arsenals were also working to their limit of production.

There had been for some years a demand, not widespread but energetic, that in case of a crisis in the country's foreign relations the Government should take over the industries producing armament and "take the profits out of war." Private enterprise had to face the risk that this demand might in a moment of excitement become a reality; they had to face in particular the possibility that a piece of legislation somewhat akin to this demand, the so-called plant-seizure amendment (Section 9 of the Selective Training and Service Act. See under *Description of Industry* of the article entitled **DRAFT, MILITARY**) might result in the Government's supplanting private management of great companies. Apart from losing the direction of their investment, would companies be allowed to make a profit sufficient for their taking hazards in an industry of uncertain duration and, in many cases, one more or less unfamiliar? Since concerted production involved more or less restraint of trade in the interest of heavier production, and since arrangements for concerted action as to such things as quotas of material were expected of them, would manufacturers make themselves liable to later possible prosecution under the law against monopoly? Would companies declared by the NLRB to be guilty of unfair labor practices find themselves, perhaps with a half-performed contract on their hands, excluded from performing work for the Government? There was the further uncertainty how much of their profits manufacturers would have to hand back to the Government in the guise of new taxes on income. Under the circumstances the private capital lent or invested toward expanding or altering factories and their material, to make armament, fell short of the need. The Government's great lending agency, the RFC, accordingly made extensive loans for carrying out the needed improvements within the desired time and for acquiring stocks of such raw materials as rubber. The Government also undertook to build some manufacturing for private operation.

Some of the manufacturers' chief difficulties were promptly settled. The War Department declared early for a return to the letting of contracts at figures based on the cost of production and a percentage of profit for the producer, as in 1917-18. The prospects as to the payments out of these profits under the new Federal taxes were clarified. On the other hand, with regard to the status of companies held by the NLRB to have failed to comply with the Labor Law, Attorney-General Jackson held (October 3) that the Defense Commission, like other Federal agencies, was bound by the NLRB's decisions. There consequently existed some doubt whether contracts with

producers such as Ford, General Motors, and the Todd shipyards, on the NLRB's blacklist yet essential to the program, were lawful.

**Early Progress in Armament.** In spite of initial delay on account of these special hindrances and of time used in putting factories in shape for production, the U.S. Treasury reported its cash payments on account of defense, for the three months ending with September 30, as \$594,975,389. These were not represented as for produced goods alone; and a considerable part of the payments for armament were likely to have to do with orders given under authorization enacted before 1940. Month by month the payments were rising by some \$20,000,000 at this time. The Defense Commission, which cleared contracts, reported that it had put through a total of \$7,660,000,000 of these in approximately the same period, while the Bureau of the Budget had estimated at \$5,000,000,000 the expenditures to be made on account of defense in the whole fiscal year that started with July 1; compared with these totals the actual payments for the quarter that began with July 1 showed that the flow of deliveries of armament on contracts under the provisions of 1940 had barely begun.

**Other Defensive Measures.** The President, obtaining from Congress the authority to put the National Guard into service even though the emergency did not involve the Nation in actual war, called most of the troops of this body into service. The authorizing measure, a joint resolution known as the National Guard Resolution, approved by the President on August 22, applied also to the units of all reserve components of the Army; it excepted only Guardsmen under the age of 18 years and, upon their request, older members, of rank below captain, who had dependents to support by their earnings; the resolution set the duration of the required period of service at twelve consecutive months and provided that the liability to a call for such service should extend until June 30, 1942; troops that were called could be employed only in the Western Hemisphere, American "territories and possessions," and the Philippine Islands; not all need be put in service at the same time; safeguarding clauses sought to assure men their old jobs upon discharge. The mobilization of the National Guard began on September 16 upon a call for units totaling 60,500 men in 26 States. The object was to have as nearly as possible the full strength of the organization (around 240,000 men) in service by the end of the year. The reported intention of the Army to have 1,000,000 on duty by January 1 counted heavily on the National Guard to help fill this number until the conscripts under the Selective Service Act should suffice, with the mobile part of the Regular Army's more than 300,000 men, to make up a great army in being. The lack of enough cantonments and equipment imposed the chief restriction to full immediate mobilization in the autumn.

For the scope of the so-called Two-Ocean Navy Act, looking to the construction of from 80 to 90 more ships of war, and for actual progress in naval shipbuilding, see **NAVAL PROGRESS**; for further details as to the land forces, see **MILITARY PROGRESS**.

The individual measures of foreign policy bearing particularly on the military program of the United States appear in **UNITED STATES under Foreign Affairs**. The guiding motives in these

measures were the strengthening, by means conceived as short of belligerency, of powers (particularly Great Britain) then at war with anti-democratic nations and the promotion of closer relations, as to mutual defense, with other governments on the American continents. Both from Great Britain and from some of the American republics the United States obtained rights to use specified naval and aeronautical bases.

While not directly presented as among the preparation for possible attack from abroad, the need to restrain the dictator-run countries' partisans and possible secret agents played an unaccustomed part in the operations of the Federal Government. Congress passed an Alien Registration Act (signed June 28): It required aliens residing in the United States to present themselves and be registered and have their fingerprints recorded by the Department of Justice within six months; those failing to do so became liable to fine and imprisonment up to \$1000 and six months; the bill also rendered attempt to cause mutiny or insubordination in the armed forces a crime punishable by \$10,000 fine and ten years' imprisonment. Provision was made for about 500 agents of the FBI in an allied act; they were to detect spies and "sabotage" (covert acts to cripple essential operations by damaging equipment or facilities). Another act (signed October 18) obliged organizations either under foreign control or advocating the forcible overthrow of the Government to register with the Department of Justice. The registration of some 3,500,000 aliens, a laborious task, was carried on in the post offices during the latter half of the year. For activity against sedition see also **DIES COMMITTEE**.

**Attitude of Organized Labor.** The program of rapid armament set out for its goal expecting, according to an estimate of the Secretary of Labor, to have to hire or make manufacturers and contractors hire 6,000,000 people; but the program carried no special authority to check strikes or similar suspensions of work in an activity both vast and reputedly of utmost importance to the National safety. Only a few minor strikes and interruptions of work on account of jurisdictional disputes between unions arose to delay progress prior to the National election. But as in 1936, soon after election day, the C.I.O. started a strike that on November 15 halted the work of a force of 5200 at an establishment of Vultee Aircraft, Inc., in Los Angeles. The firm had undertaken to fill Federal orders for about \$82,000,000; much of the total covered airplanes of the type needed for training pilots; the Government would require these long before it could make use of the great stock of airplanes that it was ordering for need in case of actual war. Deliveries of the training airplanes were currently due at the rate of more than 200 a week. As the strike went on, Philip Murray, on assuming (November 22) the presidency of the C.I.O., warned the Government not "to force shotgun agreements between the C.I.O. and the A.F.L." and intimated a purpose to proceed first with establishing the C.I.O. in the industries for defense. The Dies Committee came out about the same time with an announcement that it would investigate the strike; Attorney-General Jackson rejoined (November 23) that the FBI had already investigated it, had found the influence of Communists in it, and had reported to the War and Navy Departments; Jackson's rejoinder cast blame on the committee's "effort to disparage and discredit the good work of the

**FBI.** The Defense Commission had a member, Sidney Hillman, in special charge of matters affecting labor, but his powers did not extend beyond advice and conciliation and seemed inadequate for quelling anything like a repetition of the series of strikes engineered by the C.I.O. in 1937. The Vultee strike, after running for 12 days, ended in higher pay for a great part of the employees, at a cost of about \$1,262,000 a year, and an agreement to compose or arbitrate future differences.

Compare the topics listed under **DEFENSE, NATIONAL.**

**DELAWARE.** Area, 2434 square miles, including (with area added by the revision of the New Jersey boundary) 469 square miles of water. Population, Apr. 1, 1940 (census), 266,505; 1930, 238,380. Cities (1940): Wilmington, 112,504; Dover (the capital), 5517.

**Agriculture.** Delaware's harvest of the principal crops comprised, for 1940, 366,000 acres. Corn, on 141,000 acres, made 3,948,000 bu.; in estimated value to the farmers, \$2,685,000. Wheat, on 74,000 acres, grew 1,406,000 bu. (value, about \$1,097,000); tame hay, 75,000 acres, 101,000 tons (\$1,162,000); apples yielded 1,909,000 bu. for market (\$1,718,000); peaches, 437,000 bu. (\$306,000); sweet potatoes, on 5000 acres, 725,000 bu. (\$580,000).

**Education.** For the academic year 1939-40 Delaware's inhabitants of school age were estimated at 52,000. The year's enrollments of all pupils in public schools numbered 44,798; this comprised 426 in kindergartens, 26,111 in the elementary group, and 18,261 in high school. The year's expenditure for public-school education amounted to \$4,184,938, current; and to \$4,994,925, total. The public schools' 1717 teachers received yearly salaries averaging \$1589.

**History.** At the general elections (November 5) the popular vote for President went to Roosevelt (Dem.) by 74,599 to 61,440 for Willkie (Rep.), or by about 5 to 4. For United States Senator, James M. Tunnell (Dem.) defeated John G. Townsend, Jr. (Rep.), the incumbent. For Governor, however, the vote went to Walter W. Bacon (Rep.) and against Josiah Marvel, Jr. (Dem.).

**Officers.** Delaware's chief officers, serving in 1940, were: Governor, Richard C. McMullen (Dem.); Lieutenant Governor, Edward W. Cooch; Secretary of State, Josiah Marvel, Jr.; Attorney General, James R. Morford; Treasurer, Fagan H. Simonton; Auditor, Benjamin I. Shaw; Superintendent of Public Instruction, Dr. H. V. Holloway.

**DEMOCRATIC PARTY, CONVENTION, AND CAMPAIGN.** See **ELECTIONS, U.S. NATIONAL.**

**DEMOCRATS FOR WILLKIE.** See **ELECTIONS, U.S. NATIONAL.**

**DENMARK.** A formerly independent kingdom of northwestern Europe, occupied by German armed forces on Apr. 9, 1940. It comprises the peninsula of Jutland, the two main islands of Zealand and Funen, and about 200 smaller adjacent islands in the Baltic. The Faroe Islands (q.v.), an integral part of the kingdom, were occupied by British troops on April 13 pending the outcome of the European War. Greenland (q.v.), a Danish dependency, remained under the control of the local Danish administration but direct contact with the Copenhagen Government was severed when the German occupation of Denmark took place. The

King of Denmark is also King of Iceland (q.v.). On Apr. 9, 1940, the Icelandic Parliament voted temporarily to nullify the King's executive powers and to assume independent control of Iceland's foreign relations. Capital of Denmark, Copenhagen (Köbenhavn). King, Christian X, who succeeded to the throne May 14, 1912.

**Area and Population.** Area, excluding the outlying possessions, 16,576 square miles. Estimated population on Jan. 1, 1940, 3,825,000. American citizens living in Denmark on that date numbered 552. Living births in 1939 numbered 67,914 (17.8 per 1000); deaths, 38,535 (10.1); marriages in 1938 totaled 33,624 (8.9). Populations of the chief cities at the 1935 census were: Copenhagen, 843,168; Aarhus, 90,898; Odense, 76,116; Aalborg, 48,132.

**Education and Religion.** There is no illiteracy. The 4472 lower schools had 480,000 pupils on Jan. 1, 1938; secondary, professional, and vocational schools, 74,100; the two universities at Copenhagen and Aarhus, 5700. The 1921 census showed 3,221,843 Protestants, 22,137 Roman Catholics, 5947 Jews.

**Production.** About 35 per cent of the working population is engaged in agriculture and dairying and 33 per cent in industry. Commerce and fishing are other principal occupations. The July 15, 1939, livestock census showed 3,127,000 swine, 3,258,000 cattle, 564,000 horses, and 27,500,000 hens. Production in 1939 (in metric tons) was: Butter, 179,000; margarine, 84,100; cheese, 35,700 (1938); meat, 393,300 (1938); wheat, 414,700; barley, 2,226,500; rye, 238,100; oats, 994,300; potatoes, 113,000; beet sugar, 218,700; milk, 51,554,000 hectoliters. The sea fisheries in 1939 yielded 88,000 metric tons valued at 43,000,000 crowns. Brandy produced in 1938 totaled 96,000 hectoliters; beer, 2,332,900. Ship construction totaled 140,000 gross tons in 1939.

**Foreign Trade.** Total imports in 1939 were valued at 1,742,000,000 crowns (1,640,900,000 in 1938); total exports, 1,575,000,000 (1,550,600,000 in 1938). The 1939 imports by leading countries of origin were (1938 figures in parentheses): United Kingdom, 574,000,000 crowns (566,564,000); Germany, 470,000,000 (401,700,000); United States, 127,000,000 (131,207,000); Sweden, 126,000,000 (106,000,000). Exports by countries were: To the United Kingdom, 826,000,000 crowns (860,800,000 in 1938); Germany, 368,000,000 (304,900,000); United States, 21,000,000 (16,900,000). Agricultural exports in 1939 were valued at about 1,100,000,000 crowns as against industrial exports of about 400,000,000 crowns. See **TRADE, FOREIGN.**

**Finance.** Closed accounts for the fiscal year ended Mar. 31, 1940, showed receipts of 640,800,000 crowns and expenditures of 631,500,000 crowns in the ordinary budget. The 1940-41 ordinary estimates placed receipts at 644,400,000 crowns, expenditures at 693,100,000. The public debt was 1,229,141,000 crowns on Mar. 31, 1939. The crown (krone) averaged \$0.2183 in 1938 and \$0.2035 in 1939. In April, 1940, the German Government fixed the official relative value of the Danish crown at two crowns to one reichsmark.

**Transportation.** Railway statistics for 1938-39 fiscal year (ended March 31): Miles of line, 3189 (state-owned, 1625); freight, 4,868,147 metric tons; passengers, 52,014,366; operating deficit, 4,500,000 crowns. Highways extended 32,212 miles (1939). The Danish Air Transportation Company carried 71,750 passengers in 1939 (65,179 in 1938). The Danish merchant fleet on Jan. 1, 1940, comprised

736 vessels of 1,171,128 tons. Earnings of the merchant marine in 1939 were estimated at 450,000,000 crowns (280,000,000 in 1938). During 1939 23,744 ships of 7,600,000 net registered tons entered the port of Copenhagen.

**Government.** The Constitution of June 5, 1915, as amended Sept. 10, 1920, vests executive power in the King acting through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and Rigsdag. The Folketing (lower chamber of the Rigsdag) consists of 149 members elected for four years by proportional representation. The Landsting (upper chamber) comprises 76 members serving for eight years; 19 members are elected by the Landsting itself and every four years half the remainder is elected indirectly by voters of over 35 years. Premier in 1940, Thorvald A. M. Stauning (Social Democrat), heading a coalition government of the Social Democratic and Radical parties. For events of 1940, see *History*.

### HISTORY

Although the Danish Government clung to the policy of strict neutrality adopted upon the outbreak of the European War (see *YEAR BOOK*, 1939, p. 194), neither this nor the non-aggression pact signed with Germany on May 31, 1939, sufficed to prevent the long-dreaded invasion. German armed forces on Apr. 9, 1940, occupied the kingdom "for the duration of this war," meeting virtually no resistance from the small Danish army.

**Strains on Neutrality.** A hint that Denmark did not feel prepared to defend itself against aggression was given by Premier Stauning in his New Year's Day address to the nation. The adverse repercussions of this statement led the Folketing on January 19 to resolve, 135 to 0, with the German member from Schleswig abstaining, that "the country's neutrality must be maintained and . . . all disposable means if necessary shall be used to keep order, preserve and protect the realm's peace and independence . . ."

Soon afterwards control of Danish shipping by the British blockade and the systematic sinkings of Danish ships by German submarines and airplanes were intensified. On February 25 the Danish, Norwegian, and Swedish Foreign Ministers conferred in Copenhagen. They decided to support one another in all negotiations with the belligerents and formally demanded that the neutral rights of the Scandinavian States be respected. Compensations would be demanded for losses resulting from such violations, it was agreed, and the three States would resist any attempt by either side to involve them in the war.

In accordance with these decisions, the three governments on February 29 sent Germany, Great Britain, and France uniform protests against indiscriminate warfare on neutral shipping. In reply Germany charged that acceptance of the British contraband control system was not in conformity with either the neutrality or the sovereignty of non-belligerent States, while the British Ministry of Economic Warfare insisted that it was the duty of neutrals to submit to this "exercise of belligerent rights." This was followed on March 12 by an Anglo-Danish trade agreement under which Denmark agreed not to re-export to Germany many vital imports from overseas and to restrict shipments of Danish products to the Reich.

**The German Invasion.** Without the slightest warning, German motorized troops crossed the

virtually undefended Danish frontier on the early morning of April 9 and drove rapidly northward, leaving units in control of the Danish cities and towns. Other troop contingents landed at Middelfart on the island of Funen, at Korsor and Nyborg on the Great Belt, and at Gedser, Danish terminus of the Warnemuende Ferry. At the same time Copenhagen was seized by about 1000 German troops, secreted in the holds of three ships disguised as colliers, which had been guided through mine fields guarding the port by an unsuspecting Danish pilot. Hundreds of German warplanes thundering overhead helped to overawe the Danish State Council, consisting of King Christian, Premier Stauning, Foreign Minister Peter Munch, and Defense Minister Alsing Andersen, which met in the King's residence. The Council decided to capitulate, with a formal protest at the German invasion.

According to Gen. Leonhard Kaupisch, Commander of the German forces, the invasion was accomplished with such speed, secrecy, and thoroughness that the Danes were taken completely by surprise. Before the Danish troops received the order of their government to surrender, some minor clashes took place in South Jutland in which a score of Danes were killed and double that number wounded. The German forces lost only a few dead and wounded. Considerably more than an army corps was used to establish German control of the kingdom. As in Norway, the Netherlands and other countries, the German troops were aided in the conquest by both German agents in Denmark and Nazi sympathizers among the Danes. Fritz Clausen, leader of the small Danish Nazi party, was reported to have appeared in a Storm Trooper uniform to direct operations on the Copenhagen waterfront when the German troops landed.

While the military occupation of the capital was in progress, the German Minister in Copenhagen handed the Danish Government a memorandum identical with that submitted to the Norwegian Government on the same day. It charged that Denmark "had failed to resist earlier transgressions by England and France," that it could not resist a surprise Anglo-French occupation alleged to be impending, and that German troops entered Denmark not in a hostile spirit but merely "to safeguard the Danes against the intended occupation of Danish strategic points by English and French forces" "Germany," the statement concluded, "has no intention through her measures now or in the future of touching upon the territorial integrity and political independence of the kingdom of Denmark."

**The Protectorate.** Under the German protectorate the Danish armed forces were demobilized (April 17) and German troops occupied their barracks. General Kaupisch retained control of all military matters, while the German Minister in Copenhagen, Dr. Cecil von Rente-Finck, with the aid of a greatly enlarged staff, assumed supervision of Denmark's economic life and foreign affairs. The powers of the Danish King and Government were progressively restricted.

On April 10 Premier Stauning told an extraordinary session of the Rigsdag that his government would remain in office. "The King and his present Ministers have so resolved," he was quoted as saying, "with confidence in Germany's assurance that Germany does not intend to harm Denmark's territorial integrity or political independence by the measures that have been effectuated to regulate the mutual relations resulting from the occupation."

The Stauning Cabinet was reorganized on the same day. The Social Democratic and Radical Ministers all retained their posts, but the cabinet was expanded to include three Conservatives and three Liberals serving as Ministers without Portfolio. This brought all four of the major political parties into the government.

Under orders from Berlin, censorship of the press was instituted along with blackouts and other wartime measures. Air raid drills were held in Copenhagen and bomb shelters constructed throughout the city. The Danish airport at Aalborg in Jutland, used by German planes in connection with the Norwegian campaign, was repeatedly bombed by British airmen, with some damage to the adjacent civilian population.

Relations between occupationary officials and forces and the Danish population were peaceful at first. However the growing German economic exactions, activities of the German secret police, and the increasing pressure upon the Danish people and government to accept their allotted role in the German "new order" in Europe caused growing resentment and a stiffening of resistance. The growth of Danish national patriotism was evidenced by the enthusiasm with which Constitution Day was celebrated on July 5 and by great demonstrations of national unity and loyalty to King Christian on the occasion of his 70th birthday (September 26).

Minor clashes between German troops and young Danes were reported with increasing regularity, along with cases of sabotage. A decree of June 14 ordered the surrender of all private arms, including hunting rifles, at police stations. Encouraged from Berlin, the Danish National Socialist party waged an increasingly aggressive campaign against the kingdom's democratic government and institutions. On July 2, 154 young Nazis were arrested for holding a street demonstration in violation of the law forbidding political gatherings. The Danish authorities proved unable to curb Nazi meetings, however, and on October 27 the Social Democratic unions of Copenhagen held their first political mass meeting since April to counter Nazi propaganda. Severe rioting between uniformed Danish Nazi demonstrators and anti-Nazi crowds occurred in the capital on November 18 and in the South Jutland town of Hadersleben on December 9.

In an effort to resist growing pressure from the German occupationary authorities and their Danish Nazi allies, the five principal political parties on July 3 formally agreed to "abandon all points of disagreement and unite to make secure the independence and integrity promised our country." A new coalition cabinet was formed July 8. The Social Democratic Premier, Thorvald Stauning, retained his position but as a concession to Germany Eric Scavenius, Foreign Minister during the first World War, succeeded Dr. Munch at the Foreign Office. Scavenius was reported to have endorsed the Reich's "new order" in Europe. At the year's end, it was indicated that the German authorities, despite protests of the King, were demanding the elimination of the Social Democrats from the government and their replacement by Danish Nazi leaders.

The transformation of Denmark into an economic and political vassal of the Reich also led the Danish trade unions and employers' associations to unite in defense of Danish national interests. Workers and employers agreed to abandon strikes and lockouts, settle all disagreements by negotiation or

arbitration, and use their funds, accumulated for the purpose of fighting one another, to create more work and stabilize economic conditions. With the consent of both labor and capital, laws putting these principles into practice were promulgated by the Danish Government. In October a Danish National Council was formed in London to win British support for the restoration of Danish independence.

**Economic Difficulties.** The German occupation meanwhile was rapidly undermining the bases of Danish prosperity. Even before the invasion, the economic strain of the war led Denmark to seek a \$10,000,000 credit from the U.S. Import-Export Bank. Washington granted the credit, but withdrew it upon news of the German occupation. The Germans thereafter systematically expropriated Denmark's economic resources to meet the Reich's wartime needs. Food, gasoline, and coal were strictly rationed. Reserve stocks of oil, raw materials and foodstuffs were shipped to the Reich. The economic activities of the Danes were closely regulated by the German authorities.

Private driving of automobiles was ended almost immediately and in the autumn the fuel shortage led the authorities to limit permits granted for the operation of trucks and buses equipped with wood-gas and peat-gas generators. Travel and train service was greatly restricted. The use of alcohol except light beer and wine was prohibited, as was the production of margarine, lead, rubber, and cocoa products except when they were for military and related purposes.

Large quantities of livestock, butter, bacon, eggs, and other products were shipped to Germany. They were "paid for" at first with German-issued credit certificates that circulated only in Denmark. When the Danish farmers refused to exchange their products for this virtually worthless paper, the Danish National Bank was forced to finance the purchase of Danish produce with Danish currency through a so-called German clearing account. The Germans fixed their own prices for both the Danish produce sent to Germany and German manufactures and other goods received by Denmark in exchange. In addition the German Government paid into this clearing account the wages of thousands of Danish workers who accepted employment in Germany when their own industries were forced to shut down. Despite these wage payments and the fixing of import and export prices at rates highly favorable to Germany, the Danish Minister of Commerce reported in August that in four months the German trade debt to Denmark had risen by 800,000,000 crowns.

Inability to import fodder forced the slaughtering for export to Germany of half of Denmark's pigs, one-fourth of its cattle, and a large proportion of its poultry by the end of September. The potato crop of Jutland was requisitioned by the Germans. White bread was added to the list of rationed articles August 31, butter in November, and soap on December 31. The fat content of all cheese and cream was drastically reduced by government decree on November 21 to maintain exports to Germany while safeguarding the domestic consumption of milk and butter. As a result of the slaughter of livestock and other factors, milk output at the beginning of December, 1940, was estimated to be 25 to 30 per cent lower than a year before, while butter production was 30 to 35 per cent lower. Prices of all necessities had steadily risen. Fuel prices were 100 per cent higher at the

end of September, 1940, than a year earlier; food, 21 per cent; taxes, 37 per cent.

The Danes were also obliged to accept Germany as the middleman in trade agreements made subsequent to the occupation in an effort to find new markets to replace that lost in Great Britain. A special barter agreement was concluded with Finland June 4. Under a triangular clearing agreement concluded in August, German products valued at approximately 30,000,000 Swedish crowns were to be imported into Sweden in payment for Swedish exports to Denmark. A similar arrangement for the first half of 1941 was concluded in December. A Danish-Soviet trade and payments agreement was made September 17.

The earnings of the Danish merchant marine, source of an important part of the national income, were sharply curtailed. Danish ships in Allied ports were requisitioned and chartered by the British and French Governments after the German occupation. The Allied governments gave Danish owners of ships in neutral ports until June 8 to register their ships under either the British or French flags and charter them to the Allies for the duration of the war. Thereafter Danish vessels not transferred to an Allied flag were declared "enemy ships," subject to seizure on the high seas as prizes of war. Consequently many of the Danish ships remained idle in neutral ports.

**Royal Heir Born.** The line of succession to the Danish throne was secured on Feb. 17, 1940, with the birth of a son to Princess Caroline Mathilde, wife of Prince Knud, second son of King Christian. Crown Prince Frederik and his wife had no children.

**DENTISTRY.** The Dental Centenary Celebration at Baltimore, Md., in March was the event of the year 1940. It commemorated the founding of the first dental school in North America at Baltimore, the meeting of the first dental society as a recorded organization, and the appearance of the first dental journal, all one hundred years ago. The most striking features of the occasion were the historical exhibits, the historical drama, and the academic convocation. The general and scientific sessions, although carefully conceived and well administered, do not present either an adequate or an undistorted picture of either the science or art of dentistry. There were 19 sessions, each limited to a particular field of dentistry, and three general meetings. For each scientific section there were three formal papers and brief introductions of each essayist by either the chairman or vice-chairman. The selection of these section officers and the speakers was intended to be representative of the outstanding figures in each group from North America. On the other hand the contents of the papers are not always indicative of the most significant contributions of the authors to dentistry. The roster of the participants in the various activities of the Centenary includes most of those currently and productively active in dentistry in the United States and many from outside. The voluminous proceedings cover all phases of the Centenary's activities and is handsomely illustrated (*Proc. Dental Centenary Celebration, Baltimore*. Waverly Press, 1940.)

Kellogg Foundation Institute. April 3rd

marked the dedication and formal opening of the W. K. Kellogg Foundation Institute for Graduate and Post-graduate Dentistry at the University of Michigan. In the minds of the donors this Institute was given for the purpose of promoting "graduate and post-graduate education under the sponsorship and direction of the school of dentistry of the university." It was accepted by the university with the belief that "this institution represents one more step toward securing better health for the people of Michigan." For nearly ten years this Foundation has been experimenting with methods to improve the quality of health service given to the inhabitants of five counties centrally located in the State. Amongst others it has encouraged the dentists to take postgraduate courses, arranged for and supported suitable courses in and outside of the State. In addition it has contributed to the personal and traveling expenses of the groups organized for such study. The success of these experiments in the form of better health service to the communities served by these dentists fixed the determination of the Foundation to establish the Institute under the direction of the Dental School of the University of Michigan, no doubt because of its confidence in the ability of the dental school faculty with the help and backing of the rest of the university to make the largest possible contribution toward securing better health for the people of Michigan within the limits of dentistry. The plan obviously aims to increase both the quantity and quality of dental service within the borders of the State. The new building was made possible through financial support from, not only, the Kellogg Foundation, but also Federal and State Agencies. (*Jour. Amer. Den. Assoc.* 27: 817)

**Harvard Plan for Reorganization of Dental Education.** In contrast with the above a new departure which "will combine the basic knowledge and skills of both medicine and dentistry and is designed to train new types of scientific workers for the attack on the great public health problem of dental disease" was announced by Harvard University at about the time of the beginning of the present scholastic year. "Under the new program, the Harvard Dental School will be renamed the Harvard School of Dental Medicine. Dental Students will register in both the new School of Dental Medicine and in the Harvard Medical School, taking three and one-half years of the same medical courses as other students in the Harvard Medical School, and in addition one and one-half years of specific training. Graduates will receive both the M.D. and D.M.D. (Doctor of Dental Medicine) degrees. . . . It is planned to limit admissions to the new School of Dental Medicine to a small number of highly qualified men who will be prepared for certain particular opportunities in the dental field; in teaching, research, special types of practice, general practice and public health. . . . The new program will go into operation in the fall of 1941." It should be remembered that the regular M.D. degree is conferred by most schools now only after an overall five year course, four years in medical school proper and not less than one additional year as a hospital interne under medical school supervision. This five year course represents the minimum standard for the M.D. degree in medicine and the privilege of applying for license to practice medicine. Dental Schools are now conferring either the D.D.S. or D.M.D. degree for four years in dentistry, two years of which are roughly comparable to the first two years in medi-

cine. Under favorable circumstances, permitting no duplications of like courses, an able student can now earn both degrees in seven years (scholastic) and no less, probably more. Yet Harvard proposes to confer both degrees for only five years of study (again scholastic years). It is this phase which has raised much criticism and a belief that the plan is "subversive of the interests of dentistry and of public health." (*Bul. Harvard Univ. and Amer. Dent. Jour.*, 27: 1488.)

Council on Dental Education of the American Dental Association elected an Executive Secretary about the middle of the year and under the date of Oct. 19, 1940, adopted the requirements for approval by them of the schools training dentists. These requirements have been published and distributed to the schools and others interested in them. Schools are given from Jan. 1, 1941, to the beginning of the school year of 1942-43 (September, 1942) to put their houses in order as soon after that date inspections by the Council for certification will begin.

A new journal, *Dentistry, a Digest of Practice* made its appearance in August. As suggested by the name it is a digest or abstract of current literature, about pocket size, about 60 pages, 25 to 31 abstracts per number and one double page editorial. There is no advertising and no illustrations. It has rapidly attained popularity (circulation about 7500 paid subscriptions).

No revolutionary discoveries have been reported: Research in the field of dental caries is continued at a level of high activity; search is being made for substances that will inhibit the process, interest in fluorides is maintained on the basis of such data as that supplied by the communities of Galesburg and Quincy with the surrounding territory. Low caries incidence is parallel with high relative fluorine content of the city waters. The dental history of the Dionne quintuplets supplies a lesson in early caries prevention. Dietary deficiencies, use of sulfanilamide, and the acrylic resins are featured in many papers.

**DIES COMMITTEE.** The U.S. House of Representatives' committee for the investigation of un-American activities, or Dies Committee (Martin Dies, of Texas, Chairman), continued throughout the year its inquiries into the operations of communists and of others suspected of working for the policies of foreign governments, adversely to the interests of the United States. Fear lest the dictatorially governed powers should commit aggression against the United States or other republics counting on its protection greatly increased the committee's influence and brought about some of the objects for which Dies and his supporters among the committee had striven: notably, an act of Congress approved October 18 required organizations either under foreign control or advocating the overthrow of the U.S. Government by force to register with the Department of Justice.

Immediately after the approval of this act Dies announced (October 19) that unless the Government took adequate means to end the political activities of representatives of foreign governments in the United States he would publish data on the subject; and a month later (November 21) the committee issued a "White Paper," containing numerous communications of German diplomatic and consular officials and heads of several organizations administering to the American public information regarded as charged with propaganda. These organizations were the Transocean News Service, the German Library of Information, and the American Fellowship Forum. The published data on these bodies included communications making it appear that in some cases German authorities had given directions that particular, specified matter be disseminated. There followed (November 27) the publication of a "Red Paper," collating records of Communist interest in the control of water-transport workers and in a general strike in case of war.

Early in the year the committee was the subject of a never fully exposed effort to discredit it; and an obscure maneuver was conducted against its active opponents in the House of Representatives. F. E. Hook, Michigan Democrat, offered to the House, late in January, letters purporting to have been written by William Dudley Pelley, head of an organization known as the Silver Legion of America, and to show a connection between Pelley and Dies; the tendency of Hook's proceeding was to indicate Dies as secretly friendly with one of the groups suspected of opposing some of the more liberal features of the Federal Constitution. The letters appeared soon after the Department of Justice had seized in New York City a number of men connected with an association of the semi-military type, known as the Christian Front, sympathetic with social doctrines attributed to the "radio priest," Father Coughlin of Detroit; the arrested men were later tried on charges of conspiracy, declared by testimony to have accumulated weapons, and ammunition, and acquitted (see NEW YORK); meanwhile, their arrest gave opportunity for intimations that the Dies committee had neglected to investigate Coughlin and the Christian Front. The committee was seeking funds from Congress about the time when the Pelley and Christian Front matters loomed up.

The letters offered to the House by Hook at this juncture subjected the Dies committee to risk of termination or of remodeling on lines less displeasing to the Democratic liberals. Soon after the letters appeared, Representative Starnes of Alabama, acting chairman of the committee (during an illness of Dies), detailed to the House the declaration (January 30) of one David Mayne that Mayne had, upon solicitation, prepared and sold (as genuine) spurious letters purporting to have been written by Pelley, and that these were the letters that Hook had offered to the House. It appeared further that Mayne had done this, not for profit, but to trap persons seeking material against the committee. Mayne was reported to have delivered the letters at a dinner given by Gardner Jackson, described as legislative representative for Labor's Non-Partisan League, whose guests included one member of the committee itself and several other members of the House. Hook thereafter withdrew the letters from the record and apologized to the House for presenting them. Pelley, long sought by the committee, made a brief appearance before it

and denied authorship of the letters and any share in their fabrication.

In April the committee undertook to question 90 members of the Communist Party, the German-American Bund, and certain Fascist groups. There followed difficulties in Federal courts, some of which opposed the committee's efforts to imprison, for contempt, Communists refusing to testify as to their party's membership, or ordered the return of Communist records seized by the committee. It succeeded, however, in drawing testimony from divers witnesses to show that Communists had gained a strong position in some fields of transport and communication, such as the system of transit in New York City and the operation of the radio aboard ships. A former Communist worker testified that the party had groups of members in the industries for making aircraft, steel, automobiles, and other main products and among farm labor, students, the unemployed, and religious organizations on the Pacific Coast. The lack of any definite general list of the members of the Communist party continued to hamper the committee, for those questioned as members still could deny their connection. In Pennsylvania, however, the names of 26,000 persons who had signed a petition to nominate Communist candidates for public offices a month before was obtained.

On August 28 Dies announced that it would thereafter be the policy as far as possible to hold the inquiry behind closed doors; the nature of the time, he said, made it dangerous to let witnesses accuse possibly innocent persons of Communist or Nazi leanings. The output of public news about the committee's hearings diminished thereafter. By this time the Federal authorities had become disposed, in view of the need to prevent hindrance of the new program of defense, to proceed in line with some of the committee's mass of findings and suggestions with relation to subversive liberal groups.

**The President and the Committee.** On November 27, the day of the appearance of the "Red Paper," President Roosevelt sent Chairman Dies a telegram of warning, pointing out that "continuing administrative duties in relation to illegal activities lie in the executive branch of the Government and not in the legislative branch"; mentioning, as likely to "handicap or completely destroy administrative plans against subversive activities," "premature disclosure of facts or of suppositions," and "hasty seizure of evidence"; and suggesting that Dies confer with the Attorney General and arrange to avoid creating these difficulties. The message apparently carried an implication that the administration had abandoned tolerance of subversive liberals and undertaken to use the Department of Justice against any of their illicit activities harmful to the task of defensive preparation. There followed an agreement with the Attorney General for harmony between the Committee and the Department of Justice. Chairman Dies had no part in the conferences for this agreement, but he told the press that he welcomed it. Representative Jerry Voorhis of California, who conferred with the Attorney General for the committee, had opposed Dies to the extent of making a public speech (January 18) advocating that the committee investigate "organizations like" the Christian Front, at the moment when the committee's inactivity in that particular direction was put in contrast with the Department of Justice's bringing out the Brooklyn conspiracy charges. The agreement tended to make

Voorhis, rather than Dies, the committee's guide in future relations with the Attorney General.

**DIPLOMATIC CORPS.** See AMBASSADORS AND MINISTERS.

**DISASTER LOAN CORPORATION.** Created Feb. 11, 1937, pursuant to an Act of Congress to provide loans made necessary by floods or other catastrophes in the year 1937, its authority was subsequently extended to include catastrophes in the years 1936-40. Its creation, prompted by the disastrous flooding of the Ohio and Mississippi valleys in January, 1937, was a logical step toward an effective catastrophe relief program.

The Corporation functions through a headquarters office at Washington and regional offices established in catastrophe-visited areas, in charge of agents, and manned by experienced personnel. Applications for loans are submitted through the regional offices where they are considered in the first instance by the agent, and a committee comprised of local citizens, prominent in their respective fields of activities, who serve without compensation. Applications thereafter are forwarded to Washington with the recommendation of the agent and local committee for action by the Managing Directors. The proceeds of a loan are disbursed by the Federal Reserve banks.

The Disaster Loan Corporation is the only agency of its kind to initiate practical community rehabilitation at the scene of catastrophe. It is organized to operate speedily and efficiently. At the first word of catastrophe, experienced men are rushed to the scene to make an accurate survey and report of damage done and the type of aid needed to assure normal community economic and social relations with the least amount of dislocation during the rehabilitation period. The speed with which it dispatches personnel to stricken areas is equaled only by the American Red Cross.

The Corporation operates only where local lending agencies do not meet credit demands. In such instances, it fills the gap until normal credit relations are established—that is, until existing credit sources are able and willing to supply the credit demands made upon them by catastrophe victims. The average loan is for a comparatively small amount, more often than not for the purpose of replacing ruined furniture or rebuilding a damaged home. Although small in dollars and cents, such loans make possible the restoration of morale for families who might otherwise be destitute.

While the Corporation was able to aid victims of the Ohio and Mississippi valley areas by disbursing loans for small amounts, it was necessary, in the case of the New England hurricane, to make available, in addition to the usual type of DLC loan, over 13 million dollars to the Federal Surplus Commodities Corporation to enable the salvage of millions of board feet of lumber for the owners of thousands of woodlots devastated by a hurricane in the fall of 1938 which struck vast forested areas in six New England States. The Corporation has made loans in connection with floods in Arkansas, California, Idaho, Illinois, Indiana, Kentucky, Louisiana, Michigan, Missouri, Mississippi, Minnesota, Montana, Nebraska, New Mexico, Ohio, Tennessee, and Texas; cyclones in Minnesota and Illinois; hurricane in South Carolina; tornado in Georgia and Louisiana; and hurricane and flood in Connecticut, Massachusetts,

New Hampshire, New York, New Jersey, Rhode Island, and Vermont.

The Corporation's effectiveness in relieving distress resulting from catastrophes is evidenced by the fact that from its inception in February, 1937, through Dec. 31, 1940, it made loans to borrowers located in more than 40 States. During that period, it approved 22,787 loans, in the aggregate amount of \$30,611,081, and disbursed \$27,110,511. These figures include: (a) One loan authorized and disbursed to the Federal Surplus Commodities Corporation (q.v.) in the amount of \$13,902,650 for the gigantic task of clearing and marketing millions of board feet of lumber cut from logs felled by the New England hurricane of 1938; (b) 22,786 loans authorized to individuals, partnerships, and corporations in the aggregate amount of \$16,708,431 of which \$13,207,861 has been disbursed. Over 4000 such borrowers have repaid their loans in full. Total repayment on such loans amounted to about \$6,000,000, or a little more than 45 per cent of the \$13,000,000 disbursed.

The DLC reported the sale of some 425 million board feet of New England lumber and payments on the loan to Federal Surplus Commodities Corporation were scheduled to commence in 1941.

CHARLES B. HENDERSON and ALBERT L. STRONG.

#### DISASTERS AND DISASTER RELIEF.

The major disasters of the year are listed under CHRONOLOGY. See also ACCIDENTS; AERONAUTICS; DISASTER LOAN CORPORATION; EARTHQUAKES; FIRE PROTECTION; FLOODS; SHIPPING; RED CROSS.

**DISCIPLES OF CHRIST.** A communion known also as the Churches of Christ and Christian Churches. It sprang from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1940. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; National Benevolent Association; Board of Church Extension; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are affiliated with the International Convention of Disciples of Christ which meets annually. The Convention in 1941 is scheduled to meet in St. Louis, Mo. The general missionary work both home and foreign of the churches is administered through The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind. Its board of managers of 120 is composed of 60 men and 60 women. The foreign missionary work in 1940 embraced the Belgian Congo in Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Batang, on the border of Tibet.

Statistics of the communion show that during the year there were 4782 baptisms in the foreign fields. The 417 mission schools had a total enrollment of 14,849. The communion maintained 9 hospitals and 18 dispensaries which gave 558,858 treatments. The Church Extension Fund amounted to \$2,679,485.82 with outstanding loans to 385 churches. The Pension Fund for the ministry

showed assets of \$2,791,211.24. 107 young people's conferences were held. Work in America was conducted among the French, Highlanders, European immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The National Benevolent Association maintained six homes for children, and an equal number of homes for the aged. In 1940, 21 Colleges, Universities, Bible Colleges and Foundations co-operated with the Board of Higher Education. The total church membership throughout the world in 1940 was 1,829,465, a gain over 1939 of 11,302; and in the United States and Canada 1,669,222, a gain of 11,796. The Bible School enrollment for the world was 1,192,790, a loss over the previous year of 8632, and for the United States and Canada, 1,133,375, a decrease of 5660. Contributions, missionary, benevolence, and educational, reported for the fiscal year in the United States and Canada totaled \$3,703,690.07.

Among the periodicals published by the communion are *World Call*, *Christian Evangelist*, *Christian Standard*, and *Front Rank*. The president of the International Convention for the year was Dr. Harry B. McCormick, Cleveland, Ohio.

**DISEASES.** See CHILDREN'S BUREAU; DENTISTRY; MEDICINE AND SURGERY; PSYCHIATRY; PUBLIC HEALTH SERVICE; VETERINARY MEDICINE; VITAL STATISTICS.

**DISTRICT OF COLUMBIA.** An area, now coterminous with the city of Washington, constituting the Federal territory authorized by the Constitution for the seat of the United States Government. The city of Washington, formerly a political entity in the District, has become merged with it in political respects. The District is governed in accordance with acts of Congress. Total area, 69¼ square miles; land area, 61 square miles. Population, April, 1940 (census), 663,091; 1930, 486,869.

The growth of the population of the District in the period 1930-40 exceeded that of any other of the 42 most populous cities of the United States, in percentage and, except for the increases of New York and Los Angeles, in number as well. Since the city lacked private industries other than those directly serving its dwellers, its growth resulted essentially from increase in the personnel of the Government.

Measures to add to the attractions of the National capital were many. Joseph E. Widener of Philadelphia was reported (October 17) to have decided to give his collections of works of art to the National Gallery of Art, then being built with money given by the late Andrew W. Mellon, to house and display the latter's collection of paintings. The estate (about \$250,000) of the late Justice Holmes of the U.S. Supreme Court, left by his will to the Government, was applied by an act of Congress to the creation of a park behind the Supreme Court Building, in Holmes's memory. See PUBLIC BUILDINGS ADMINISTRATION.

An unusual popular demonstration occurred on November 7, on the return of President Roosevelt after his election for a third term. By rough estimate, 200,000 persons, not far short of one-third of the population, turned out to acclaim him. Many were Federal employees let out for the occasion.

**DJEBEL DRUSE.** See SYRIA AND LEBANON.  
**DOBRUJA.** See BULGARIA and RUMANIA under *History*.

**DODECANESE ISLANDS.** See **AEGEAN ISLANDS, ITALIAN.**

**DOGS.** Tightening of the regulations governing the Westminster Kennel Club's annual exhibition at Madison Square Garden and the elevation of American-bred dogs to a commanding position in international exhibitions were two important highlights in the 1940 history of dogdom.

Drastic changes in its rules were made to limit (beginning in 1941) the Westminster show to entries (except puppies) which have previously won first, second, or third prizes at other recognized competitions, and the entire exhibition was shortened from three to two days. By raising the standards and reducing the number of dogs, the club sought to solidify the Westminster's position as the No. 1 canine show of the year.

However, the 1940 Westminster exhibition was conducted along the usual lines of recent years. Herman E. Mellenthin's coal-black cocker spaniel, *Champion My Own Brucie* was adjudged the best of all breeds at the show. Thereafter he was shown twice more during the year, gaining top honors at the Detroit Kennel Club exhibition and repeating his triumph at the Cocker Spaniel Breeders' of New England specialty show in Boston.

The 14th annual exhibition of the Morris and Essex Kennel Club was held as usual at the Giralda Farms, Madison, N.J. Because of the European War, the total of 4087 entries was the smallest since 1936. Here, as at Madison Square Garden, an American-bred dog triumphed, the winner being the great standard poodle *Champion Blakeen Jung Frau*, bred and owned by the Blakeen Kennels of Mr. and Mrs. Sherman R. Hoyt of Katonah, N.Y.

Taken as a whole, the year 1940 was one of the most successful in the history of dogdom in the United States. There was a decided increase in the number of exhibitions and the general public attendance was somewhat above the average.

**DOMESTIC RELATIONS.** See **LAW** under *Private Law*.

**DOMESTIC SERVICE.** See **LIVING COSTS AND STANDARDS.**

**DOMINICA.** See **WINDWARD ISLANDS**

**DOMINICAN REPUBLIC.** A West Indian island, occupying the eastern two-thirds of the island of Hispaniola (Haiti). The name of the capital was changed from Santo Domingo to Ciudad Trujillo, Jan. 9, 1936.

**Area and Population.** Area, 19,332 square miles; population, estimated on Dec. 31, 1939, at 1,655,779. About 40 per cent of the inhabitants are white (mainly of Spanish descent), 40 per cent mixed, and 20 per cent Negro. American citizens, including Puerto Ricans, in the republic (1939) numbered about 2550; other foreigners in 1935—Haitians, 52,657; British subjects, 9272; Spaniards, 1572. Populations of the chief cities (1935 census): Ciudad Trujillo, 71,297; Santiago de los Caballeros, 33,919; San Pedro de Macoris, 18,889; Puerto Plata, 11,777. Language, Spanish.

**Defense.** As of Nov. 1, 1939, there were 3212 men in the active army, 10,000 trained army reserves, 31 men in the air force, 1 gunboat, and 4 armed coastal patrol ships. The national constabulary was organized as an auxiliary arm of the army in 1936. National defense budget in 1940, \$2,070,000.

**Education and Religion.** About 80 per cent of all adult Dominicans were illiterate at the 1935 census. Statistics for 1939 showed 947 primary schools, with slightly more than 103,000 pupils,

6 secondary schools with 1550 students, 12 vocational schools with 3300 students, 3 normal schools with 2000 students, and the University of Santo Domingo (founded 1558), with 350 students. About 97 per cent of the people are Roman Catholics.

**Production.** Agriculture supports about four-fifths of the population. Raw sugar accounted for 64 per cent of the value of all exports in 1939; total production for 1939-40 was 454,812 metric tons. Exports in 1939 in order of value were (in kilos, equal to 2.2 lb.): Raw sugar, 407,370,000; cacao, 28,072,000; coffee, 14,135,000; yucca starch, 11,473,000; leaf tobacco, 8,714,000; corn, 14,401,000; molasses, 95,461,000. Banana exports were 824,000 bunches; live cattle, 9791 head. Potatoes, beans, onions, peanuts, pineapples, etc., are grown mainly for home consumption. Sugar refineries employ about 92 per cent of all persons engaged in industry. Forests yield mahogany, espinillo, lignum-vitae, cedar, and other cabinet and dye-woods. Some gold is mined (shipments in 1939, \$220,630).

**Foreign Trade.** Imports in 1939 totaled \$11,592,000 (\$11,342,495 in 1938); exports, \$18,643,302 (\$14,347,033 in 1938). Chief exports in 1939 (provisional figures): Raw sugar, \$11,804,000; cacao, \$2,014,000; coffee, \$1,732,000; yucca starch, \$624,000; leaf tobacco, \$422,000. Distribution of 1939 exports by countries: United Kingdom, \$6,750,524; United States, \$5,051,357; France, \$2,219,208; French Morocco, \$1,418,202; Netherlands, \$873,577. See **TRADE, FOREIGN.**

**Finance.** Budget estimates for 1940 placed revenues at \$12,140,000 and expenditures at \$12,135,000 (\$11,595,000 and \$11,483,000 respectively in 1939). In 1938 actual receipts were \$11,919,000 and expenditures \$11,379,000. Foreign debt on Dec. 31, 1938, \$15,604,000; internal debt, about \$1,285,000. The Dominican peso is equivalent to one U.S. dollar.

**Transportation.** The republic in 1939 had two railways with 147 miles of line; 2535 miles of highways; regular connections with Pan American Airways Caribbean circuit at San Pedro de Macoris; a deep-water port at Trujillo City and others for vessels of lighter craft at Azua, Barahona, La Romana, Monte Cristi, Puerto Plata, Sanchez, and San Pedro de Macoris. The Caribbean services inaugurated by a steamship line owned by the Dominican Government in November, 1938, were extended during 1939.

**Government.** The Constitution of June 20, 1929, revised as of June 9, 1934, vests executive power in a President elected for 4 years by direct vote. There is a Congress of 13 Senators and 35 Deputies, elected for 4 years by direct suffrage of literate males. However Gen. Rafael Leonidas Trujillo Molina's Dominican party is the only political organization permitted. Trujillo was President of the republic from Aug. 16, 1930, to Aug. 16, 1938, when he was succeeded by his own candidate, Dr. Jacinto B. Peynado. As officially designated Benefactor of the nation, General Trujillo enjoyed a legal status co-equal with that of the President. As War Minister, he remained in active control of the army. For developments in 1940, see *History*.

## HISTORY

**New President Inducted.** President Peynado died on Mar. 7, 1940, after a leg amputation had failed to check an infection, and was succeeded by the Vice-President of the republic, Dr. Manuel de

Jesus Troncoso de la Concha, who under the Constitution was to serve out President Peynado's term expiring in August, 1942. General Trujillo, unofficial dictator of the republic, returned hurriedly to the capital upon President Peynado's death, after a two weeks' absence part of which was spent as a guest at maneuvers of the U.S. Navy between Puerto Rico and the U.S. Virgin Islands.

Trujillo's presence prevented opposition elements from taking advantage of Dr. Peynado's death to attempt the overthrow of the dictatorship. One of the periodic conspiracies against Trujillo was reported to have been crushed in January. Dominican sources asserted that Gen. Ramón Velazquez Rivera, former Dominican army chief of staff, had died in prison. He was jailed on a conspiracy charge after his return to Ciudad Trujillo in 1939 from serving as Dominican consul general at Bordeaux, France. According to this report, two of Velazquez Rivera's brothers and a number of his other supporters were shot to death in Ciudad Trujillo at about the same time the former chief of staff died of slow poison.

**Refugee Settlement.** As a result of General Trujillo's offer to the Inter-Governmental Committee on Political Refugees in London in 1939 to receive up to 100,000 selected European refugees as colonists, a program of refugee settlement was begun during 1940. A contract for the immediate admission and settlement of 500 families, mainly Jews from Germany and Poland, was signed at Ciudad Trujillo on Jan. 30, 1940, by the Dominican Ministers of Agriculture and Interior and officers of the Dominican Republic Settlement Association, organized and incorporated in New York by American Jews. The contract guaranteed the refugees against molestation, discrimination or persecution and made them eligible to obtain Dominican citizenship in accordance with the republic's Constitution and laws. The Dominican Government agreed to exempt the settlers from immigration taxes, federal and municipal land and property levies, and taxes on their equipment and personal belongings. The contract was negotiated with the aid of the U.S. State Department, the Inter-Governmental Committee on Refugees, and the Co-ordinating Foundation headed by former Premier Paul Van Zeeland of Belgium. Despite protests of Dominican exiles in the United States and elsewhere, the contract was unanimously ratified by the Dominican Senate and Chamber of Deputies on February 21.

The first colonists, 37 Jews from Central Europe, arrived at Ciudad Trujillo May 8 and proceeded to settle on a 26,000 acre estate at Sosua, on the north coast east of Puerto Plata, that had been donated for the purpose by General Trujillo. They and subsequent contingents received financial aid from funds left after liquidation of the American Society for Jewish Farm Settlements in Russia. On June 17 it was announced that General Trujillo had agreed to extend the contract signed January 30 to permit the settlement of additional refugees from France and England at Sosua. Four hundred refugees had settled at Sosua by the end of 1940 and another 400 were said to be en route to the colony.

**Foreign Relations.** General Trujillo's long efforts to terminate the American receivership of Dominican customs succeeded in 1940. The United States-Dominican financial convention of Dec. 27, 1924, under which the receivership was adminis-

tered, was superseded by a new convention signed in Washington Sept. 24, 1940, by Secretary Hull and General Trujillo, serving as Ambassador Extraordinary. The actual negotiations were concluded in Ciudad Trujillo on September 7 by Hugh R. Wilson, special Ambassador of the United States, and Dominican representatives.

The new convention provided for the resumption of the collection of customs revenues by the Dominican Government but carefully safeguarded the interests of American holders of outstanding Dominican bonds. All revenues of the Dominican Government were to be deposited in one bank agreed upon by both governments. The two governments likewise agreed to appoint a representative of the holders of the Dominican dollar bond issues of 1922 and 1926, charged with receiving from the Dominican Government during the first 10 days of each month the interest and amortization payments on the outstanding bonds. Not until these monthly payments were made to the bondholders' representative would the depositary bank be authorized to make disbursements on behalf of the Dominican Government. Interest and amortization payments on the bonds and the costs of the services of the bondholders' representatives and of the depositary bank were made an irrevocable first lien upon all the revenues of the Dominican Republic.

In the event that Dominican public revenues exceeded \$12,500,000 in any given year, the convention provided that specified percentages of the excess would be paid into the sinking fund for the additional redemption of the 1922 and 1926 bonds. The agreement concluded in 1934 between the Dominican Government and the Foreign Bondholders Protective Council remained in effect. It was further stipulated that existing Dominican accounting and treasury law might not be changed without the consent of the United States Government and that controversies arising between the two governments would be submitted to arbitration if a settlement could not be reached by diplomatic negotiation.

Simultaneously with the signing of the convention, the two governments exchanged notes providing for liquidation at the rate of \$125,000 annually of the claims of United States nationals against the Dominican Government, and for payment of benefits to two retired American officials who served in the General Receivership of Dominican Customs. The receivership was established at the end of the United States military intervention of 1916-24.

General Trujillo returned to the United States on December 13 on what he described as a trade mission. It was announced December 21 that the U.S. Export-Import Bank had advanced the Dominican Republic a \$3,000,000 loan, bearing 4 per cent interest and repayable in seven years. It was to be used in part to finance construction of a modern tourist hotel in Ciudad Trujillo and in part for the purchase of American road-building and other machinery. Officials of the Trujillo regime said that the Dominican Government had pledged close collaboration with the United States in military and naval matters involved in the policy of hemisphere defense.

Relations between the Dominican and Venezuelan governments became strained during 1940 as a result of vigorous protests made by the Venezuelan Foreign Minister against alleged mistreatment of Venezuelan citizens in the Dominican Republic.

Venezuela was not represented at the second conference of the Inter-American Union of the Caribbean (q.v.) held in Ciudad Trujillo early in June.

The republic was hard hit economically by a severe drought during the early months of 1940 and by the restriction of European markets for sugar, coffee, and other products. New markets were sought in the United States and commercial treaties were signed with Canada and Newfoundland in March. On May 11 a treaty of friendship was signed with the Republic of China. Early in 1940 it was reported that a Haitian-Dominican agreement had been reached for the control of Haitian seasonal labor in the Dominican Republic. See HAITI under *History*.

#### DONATIONS. See BENEFACTIONS.

**DRAFT, Military.** Three months after the sudden, total collapse of France under German attack, the United States took the unprecedented step of making its young men immediately liable to service in its armed forces in time of peace as well as war. The pace of war in Europe had convinced the Government that it could no longer hope for safety by creating defenses after war should come; it adopted the plan of training soldiers and producing materials in advance on a scale sufficient either to discourage or at worst to repel possible adversaries. The draft was but one element in a new defensive program (see DEFENSIVE PREPARATIONS, US).

**Selective Training and Service Act.** This Act providing peacetime conscription, was signed on September 16, 1940, and went into immediate effect. It originated in bills introduced early in July by Senator Burke of Nebraska and Representative Wadsworth of New York. The President soon afterward, in his armament message of July 10, approved the projected legislation. The Senate, passing Burke's bill, limited the draft to men from 21 to 31 years old and added a rider empowering the Government to take and operate any establishment or facility useful for defense, if owners would not make satisfactory terms. The House passed its measure with a provision for drafting men from 21 to 45 and a proviso (Fish amendment) deferring the measure's going into effect for 60 days, to see if voluntary enlistments would suffice to obviate a draft. Adjusted by conference and adopted in one form by both houses, the law retained, with modification, the authorization for taking over industrial establishments, dropped the wait of 60 days, and split the difference as to the upper age-limit for conscripts.

The Act required men of 21 years or over, through the 36th year of age (i.e. to the 36th anniversary of birth), whether citizens or aliens, in the United States and its territories to register for draft at such day or days and places as the President should determine. It *exempted* from registration and from draft the officers and enlisted men in the Army, Navy, Marine Corps, Federalized National Guard, and certain other services, students at the Military and Naval academies, foreign diplomatic and (if not U.S. citizens) consular officials and some groups of their aides, and a few other groups. *Exemption from draft only*, but not from registration, was granted to those who had served 3 consecutive years in the Regular Army, or performed 1 year's Federal service in the National Guard plus 2 years in the Regular Army, or served 6 years in the National Guard; also the Vice-President, Governors of States and Territories, members of leg-

islative bodies, and judges, during their terms of office; public office-holders and other persons designated by the President as necessary in their present positions were temporarily exempted; also ministers and students for the ministry were not to be drafted. Students for degrees in arts or science in colleges were to be allowed to finish the academic year before they could be summoned into service. Conscientious objectors, if found truly to be such, were to be placed, after registration and if drafted, in noncombatant service or, if their consciences forbade this, in other Federal work. *Evaders* of the draft faced trial in a U.S. District court and sentence up to five years' prison and \$10,000 fine.

The *quota* to be taken in a draft must be in the same proportion to the number of men registered, in all the States and territories; but the men of a State or territory who were serving voluntarily in the armed forces were accounted as part of its conscript quota. The President was empowered to make rules for the purposes of the Act and to establish a *Selective Service System*, under a Director of Selective Service. Local boards in the System were to classify registrants physically, mentally, and socially (as in regard to dependents) for availability, deferring service for the less suitable. Boards of Appeal were to pass on questioned rulings of local boards.

The Act limited the *area of service* of conscripts in the land forces to the Western Hemisphere, American possessions elsewhere, and the Philippines. Not over a *total force* of 900,000 conscripts might serve at a time, during peace, in the land forces. When and how many to draft and where to station them was otherwise left to the President, save that he could summon men only in so far as Congress should appropriate means and adequate quarters and as safeguards for the men's health were ready.

Conscripts' *period of service*, save in the event of war, was 12 consecutive months. Afterward, as reservists, they remained available for war and for periods of further training. Conscripts' *pay* in active service was to equal that in the Regular Army, which in turn was increased to a basic \$30 a month (with increments for grades) and thus brought to the Navy's level. Conscripts, after discharge, were entitled to their old jobs, wherever reasonably possible.

The operation of the draft was to *terminate* on May 15, 1945, unless prolonged by further action of Congress.

**Conscription of Industry.** Section 9 of the Act, also to expire on May 15, 1945, gave the President the *power to seize* and operate industrial establishments refusing to produce what the War or the Navy Department might order. The opinion of the Secretary of War or of the Navy, as the case might be, was to determine whether an establishment was able to fill an order and whether the price to be paid and the nature, quantity, and quality of the goods were fair and reasonable to require. The President was allowed to take possession of a non-complying establishment immediately and through the Department of War or of the Navy; no recourse to a process of law therefore was specified, and no limit (save May 15, 1945) was put on the period for which the Government might keep the establishment. The Government was authorized to require that its orders be filled in *priority* to those of other customers. *Failure to comply* with orders from the Govern-

ment was made a felony, punishable by imprisonment up to three years and fine up to \$50,000. The Government, however, was to pay *compensation* for seized products and material and rent on a seized establishment; but the amount of such compensation and rent, the way of determining it, and the agency liable therefor were not specified, save that amount must be fair and reasonable. The statutory rights of *seized plants' employees* as to social security and standards of labor were not to be impaired.

**The Draft in Operation.** On the day of signing the Selective Training Act, September 16, the President issued a proclamation; it set the day, October 16, of the first registration under the Act; it notified all men subject to the draft, throughout the Union, then to present themselves before boards of registration in their respective localities; and it called on Governors to appoint such boards in each State. Later proclamations arranged for registration in the Territories. A Selective Service Committee of officers of the Army and Navy, headed by Lieut. Col. L. B. Hershey, drew the detailed plans for registration and the subsequent steps of the draft. Early declaration was made (October 19) of the number of conscripts that the Army planned to admit up to July 1, 1941; the total was 789,000; leading States' quotas were 114,796 for New York, 62,223 for Illinois, 61,522 for Pennsylvania.

The Government sought to proceed with speed: Thus it could best provide defenders against a risk, officially regarded as substantial, of attack on the part of one or another of the warlike powers under absolute government; thus it could give the world an impression of faculty for prompt action in the realm of war; and not least, thus it could get the difficult moment of putting the people under a novel and, to many, hard or even repugnant liability over with, forestalling any organized obstruction. Provisions for housing additional armed forces (see DEFENSIVE PREPARATIONS) were under way, yet would not for months to come suffice the needs of all the intended conscripts. A plan of serial mustering dealt with this hitch.

Under the detailed draft plan the steps in the drafting of men followed about this order: Men generally registered on October 16, before registration boards, commonly in each election district; a draft lottery at Washington, operated by the Selective Service System, drew (October 29), from the glass bowl used in the conscription of 1917, 9000 numbers, and these were listed in the order of their drawing; the 6500 local Selective Service boards (not to be confused with registration boards), having issued to the registrants numbers running regularly from 1 up to the sum of each board's registered men, now proceeded in each case to examine men holding numbers that had been drawn at Washington, taking the men in the order in which the numbers had been drawn and classifying each man as to physical, mental, and other sufficiency or drawbacks, inclusive of the obligation to support dependents; men found fit in all respects were turned over to the Government for induction into service, in the order in which their numbers had been drawn and in totals sufficient to satisfy each local board's share of its State's quota of all the men to be called into service at the time.

**Registration Day.** On October 16, by estimate, about 16,500,000 men presented themselves for

registration. Their great number, the nature of a proceeding unexampled save in time of actual war, and the prevailing sense of suspense as to their future made the occasion memorable; but the registration passed with only rare opposition. In New York City a group of eight students at the Union Theological Seminary went to the local place of registration and declined to be registered, declaring themselves conscientious objectors not only to fighting but to registry as part of the preparations thereto. Two Socialists in the same city also refused to register. Both groups were arrested. The divinity students pleaded guilty at arraignment; they were sentenced (Nov. 14) to prison for a year and a day. A few other refusals occurred elsewhere.

The local boards, boards of appeal, and other instruments of the Selective Service organization had over them a Director, Dr. Clarence A. Dykstra, president of the University of Wisconsin and former city manager of Cincinnati. He performed the substantial service, not only of putting a new and yet unassembled organization promptly at work, but also of conducting the first steps of the draft in such fashion as to attract public trust. It was given out early that the draft boards would in general grant deferment at first, and provisionally, to men who stated that they had dependents on their earned income.

**Conscripts' Entry into Service.** The first of the drafted men reported for duty, on the days set for divers corps areas in the week of November 25, before their respective local boards. Thence they were dispatched to military units in training camps; they had previously been formally enrolled by the Army. The first contingent numbered only about 18,700 conscripts; it was reduced to this figure from 30,000, the Government making man-for-man allowance to each locality for its draftable men who had volunteered for military service after the act went into effect. Save as affected by this allowance, each area created under the Act had to deliver its proportionate quota of the first contingent. Some local draft boards had filled their whole quotas with volunteers and did not have to conscript for this contingent, but this was exceptional.

The estimated land forces in active service after the incorporation of the November contingent of conscripts were reckoned about 510,000, made up of some 380,000 soldiers in the Regular Army, 112,000 in the National Guard, and the first conscripts.

As it turned out, the Army's own examination of entrants rejected an unexpectedly high proportion of them: Some on account of criminal conviction, many for secondary physical defects, such as paucity of teeth. More men had to be forwarded to make up the resulting deficiency.

See AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; EDUCATION; LABOR CONDITIONS; MEDICINE AND SURGERY; SOCIALISM; UNITED STATES under *Legislation*.

**DRAMA.** With virtually all those European centers where the theater normally flourishes either directly involved in war or existing in constant danger thereof, it devolved upon America, and New York in particular, to act as chief standard bearer for the Drama in 1940. And it must reluctantly be admitted that she failed to rise to that opportunity with any real distinction. Rather was her dependence upon the foreign stage for a large

Kent Smith, Peggy Wood, and Jane Cowl in  
"OLD ACQUAINTANCE"

share of her theatrical entertainment clearly indicated.

The year was more than a week old when its first new play was offered, a ridiculous comedy entitled *The Male Animal*, by James Thurber (humorist and caricaturist), in collaboration with Elliott Nugent, who also was the featured actor. This was counted among the season's successes. The reverse was the fate of the next presentation, a nevertheless creditable attempt to dramatize Roark Bradford's *John Henry* tales of Negro life and superstition, with incidental music by Jacques Wolfe and with Paul Robeson to sing it. But a revival of Sean O'Casey's familiar Irish classic, *Juno and the Paycock*, with Barry Fitzgerald, Sara Allgood, and Arthur Shields conspicuous in its cast, scored more than 100 performances. And nearly as many were recorded by Elmer Rice's pleasant comedy of youth, *Two on an Island*, with Betty Field, John Craven, and Luther Adler in the chief roles. But an importation from Britain of Bernard Shaw's satirical *Geneva* subsisted for but a scant fortnight. Public curiosity concerning the unpredictable, but none the less reprehensible, antics of the once-admirable John Barrymore in *My Dear Children* kept that opus current for more than three months.

February brought, in *Two for the Show*, a worthy successor to the previous year's clever and artistic revue, *One for the Money*. And this was practically that month's sole achievement, by reason of the failure of *Night Music*, by the usually more successful Clifford Odets. But with March came a moderate hit in *The Fifth Column*, a revision by Benjamin Glazer of Ernest Hemingway's published play dealing with the War in Spain. In this Franchot Tone, Katherine Locke, Lee J. Cobb, Arnold Moss, and Lenore Ulric figured to advantage. Then followed a deliberately and shoddily, if mildly, salacious piece by Joseph Carole, Alan Dinehart, and others, entitled *Separate Rooms*, which somehow managed to last the year out with Mr. Dinehart in its principal role. Ferenc Molnar's *Liliom*, first seen in New York nearly 20 years earlier and revived once in the meantime, was admirably restaged in a new adaptation, again by Mr. Glazer, and continued through the spring season. Burgess Meredith, Ingrid Bergman, Elia Kazan, Arnold Korff, and John Emery played the more important characters. And a still more pronounced success was that of the English thriller, *Ladies in Retirement*, by Reginald Denham and Edward Percy, which introduced the highly capable British actress, Flora Robson, to the American speaking stage. Estelle Winwood, Jessamine Newcombe, and Isobel Elsom were the other ladies involved. One more of that sex brought the month to a close, *Lady in Waiting*, by Margery Sharp, adapted from her own novel, *The Nutmeg Tree*, with Gladys George as the stellar attraction.

The spring season gained substance from a four-week revival by Maurice Evans of his notable production of Shakespeare's tragical history of *King Richard II*, but a pleasant, though unimportant, comedy on a moderately propagandist topic by Vincent Sheean, *An International Incident*, understood to be his first play, failed to catch the popular fancy despite a most engaging performance of the central part by Ethel Barrymore. Though achieving a far longer run, *Higher and Higher*, a musical with the Rodgers and Hart label, was nevertheless classed among the disappointing items, as likewise was Albert Bein's fantasy, *Heavenly Express*,

though equipped with an admirable cast that included John Garfield, Russell Collins, Aline MacMahon, Philip Loeb, Harry Carey, and Art Smith. Late April, however, raised the standard with Robert E. Sherwood's impressive and moving paean on the spirit of Finland, *There Shall Be No Night*, as acted by Alfred Lunt, Lynn Fontanne, Richard Whorf, Sydney Greenstreet, Montgomery Clift, Elizabeth Fraser, and Maurice Colbourne. William Saroyan's second play of the season, *Love's Old Sweet Song*, proved to be another example of his now familiar nonconformity to any known laws of dramatic construction and something less appealing than either of its predecessors, notwithstanding the agreeable presence of Walter Huston and Jessie Royce Landis. Then Laurence Olivier and Vivien Leigh celebrated the culmination of their own personal romance with a generally inexpert presentation of *Romeo and Juliet*, Edmond O'Brien and Dame May Whitty appearing with them as Mercutio and the Nurse. Late May found summer styles coming in with such musical items as *Keep Off the Grass*, which with a cast headed by Jimmy Durante and Ray Bolger nevertheless succumbed ere fall, and an Irving Berlin-B. G. De Sylva product entitled *Louisiana Purchase*, featuring William Gaxton, Victor Moore, Vera Zorina, and Irene Bordoni, that was still flourishing at the expiration of the year. The Players Club selected for its traditional week's revival of a classic to close the season Congreve's *Love for Love*, offered as usual with an imposing cast of members and lady guest participants.

Throughout the country, and particularly in the East, the summer theaters reported approximately the same scale and range of activity as in other recent years.

In New York the second half of the year proved even less distinguished than the first. Laggard in starting, the new season found little in the way of novelty to attract except a series of musical or spectacular features designed in most instances as vehicles for the return of popular entertainers who had been out of the local picture for varying periods. These included *Hold on to Your Hats*, which brought Al Jolson back to the speaking and singing stage after an absence of a decade; *Boys and Girls Together*, performing a similar service for Ed Wynn, though after a shorter lapse; *It Happens on Ice*, wherein Joe Cook was amusingly, if illogically, pitchforked into the midst of a delectable and widely varied display of expert ice skating; and *Cabin in the Sky*, a picturesque Negro fantasy that restored Ethel Waters to the ranks of the singing artists after her two seasons as a dramatic actress in *Mamba's Daughters*. To these was presently added a new B. G. De Sylva-Cole Porter opus, *Panama Hattie*, in which, after practically no absence at all, Ethel Merman effected her appearance as a lone star. All five of these were still among the popular successes at the year's end.

The first serious item was an altogether satisfying revival by Grace George of *Kind Lady*, the tense melodrama fashioned by Edward Chodorov from a story by Hugh Walpole. Stiano Braggiotti headed Miss George's supporting company. But then began a series of inconsequential offerings of which the great majority speedily fell by the wayside, in one or two instances without risking a second performance. Among them were no fewer than four so-called satires on the life and population of Hollywood, California, but the trend that apparently threatened was promptly snuffed out.

Surprisingly one mid-September offering, Elmer Harris' *Johnny Belinda*, that received but a chilly welcome, was enabled by the clever portrayal of a deaf-mute by its leading player, Helen Craig, to endure throughout the remainder of the year. Yet an impressive and beautiful work, Maxwell Anderson's conjectural drama of the youthful Jesus as based upon the account in the Gospel according to St. Luke, which he entitled *Journey to Jerusalem*, was quickly withdrawn despite exceptionally creditable portrayals by young Sidney Lumet, Arlene Francis, Horace Braham, Arnold Moss, and others. A second revival in the melodrama class, *Blind Alley* by James Warwick, with Roy Hargrave in his original role of several seasons back, achieved a substantial run. And another surprise was the hit scored by a resuscitation of the old Brandon Thomas farce, *Charley's Aunt*, with, it was claimed, little or no modernization. Jose Ferrer played the leading part. One other item that managed to survive critical disapproval on the ground that it was not nearly up to its authors' standard of hilarity was George S. Kaufman and Moss Hart's *George Washington Slept Here*, a farcical commentary on the craze for old dwellings, with Ernest Truex, Jean Dixon, Dudley Digges, and a fairly notable cast amusingly involved.

A momentary improvement flared up in November with an altogether delightful, if not epoch-marking, presentation of Shakespeare's *Twelfth Night* with Helen Hayes as the Viola, Maurice Evans as Malvolio, June Walker as Maria, Donald Burr as Feste, and Mark Smith and Wallace Acton as Sir Toby Belch and Sir Andrew Aguecheek respectively, all under the direction of Margaret Webster; followed by the importation from London of Emyln Williams' largely autobiographical play, *The Corn Is Green*, in which Ethel Barrymore gave a completely admirable portrayal of one of the central characters and Richard Waring of the other, representing the author himself. Then came another lapse from grace which engulfed a quasi-biographical item entitled *Romantic Mr. Dickens*, that can at least be credited with effecting the New York debut of a new recruit to the stage from the family Barrymore, Diana, daughter of John, who disclosed an apparent inheritance of talent; the latest work of the Hungarian Ferenc Molnar, understood to have been written since he became a refugee in America, *Delicate Story*, which proved just a little too ephemeral to last, even with Edna Best, Jay Fasset, and John Craven contributing truly ingratiating performances; and plays by Irwin Shaw, Edward Chodorov (collaborating with H. S. Kraft), and Paul Vincent Carroll, of Eire. But late December witnessed, and the year ended in, a burst of comparative glory superinduced by a number of pleasant dramas that had evidently been reserved for the Christmas holidays. These included John van Druten's *Old Acquaintance*, an uncommonly entertaining and heart-warming comedy of the miraculously enduring friendship of two lady novelists, wholly unlike in character and temperament, and of the loss of the youthful suitor of one to the daughter of the other. Jane Cowl and Peggy Wood figured with distinction as the protagonists, with Kent Smith and Adele Longmire as the younger couple. Another was *My Sister Eileen*, an adaptation for stage purposes of the stories by Ruth McKenney that appeared originally in *The New Yorker*, later in book form, recounting the humorous and bewildering experiences that befall two girls from Ohio seeking their fortunes in New

York. As staged by George S. Kaufman with Shirley Booth and Jo Ann Sayers as the sisters, this proved the most amusing of the novelties. *Meet the People*, a lively, clever, and highly varied musical revue originated and performed by a group of talented juveniles who, a year previously, had wearied of waiting around for an opportunity to display their ability in Hollywood, formed themselves into a Theater Alliance, and staged their own program of skits, sketches, and specialties, finally reached New York, to a well-deserved welcome. Minor features of the dying year were *Pal Joey*, a Rodgers and Hart musical based on John O'Hara's moderately funny series of vernacular letters, also in *The New Yorker*, purporting to be written by a guttersnipe night club performer to a long-suffering friend, the chief character being taken with almost painful verity by Gene Kelly, with Vivienne Segal also concerned; and *The Flying Gerardos*, a less-than-expert comedy by Kenyon Nicholson and Charles Robinson portraying the domestic and love life of a family of trapeze artists, with Florence Reed as a kind of matriarch. But the very last production of the year was also one of the most noteworthy, Elmer Rice's *Flight to the West*, a serious, thoughtful, moving, and passionately sincere drama of world conditions of today, with its scene laid in a transatlantic clipper New York-bound.

Great Britain. In and near London, it is true, during the early half of the year and until the Nazi bombing raids rendered it both unsafe and impracticable, activity persisted doggedly in the theater in spite of war conditions or, rather, in large measure because of them. For much attention was devoted to providing light, extremely light, stage entertainment for Tommies on furlough. Eventually Bernard Shaw protested that, by intelligence and education, the British soldiery rated a higher grade of dramatic fare, a theory which, tested, proved to be not without foundation. For although the bills continued to be preponderantly of the frivolous type, an increased number of more substantial works not only were offered but met with success, and one of the most pronounced hits of the season was Shakespeare's *King Lear* as produced by John Gielgud at the Old Vic with himself in the title role and a supporting company that included Fay Compton, Cathleen Nesbitt, Jessica Tandy, Lewis Casson, Stephen Haggard, and Jack Hawkins. And prior to this, plays like *The Importance of Being Earnest* and *The Corn Is Green*, which had been running intermittently since pre-war days, could always command crowded houses. Even so desperately serious a work as Eugene O'Neill's *Desire Under the Elms*, never before publicly shown in London, met with popular favor although criticized as already old-fashioned. But Denis Johnston's brilliant yet incredible *Golden Cuckoo* was accorded the reverse fortune.

Among the lighter favorites were a musical by the versatile Stanley Lupino, *Funny Side Up*; a new Charles B. Cochran revue, hardly up to standard but well above current quality; and a pleasant little comedy entitled *Jeannie*, by Aimee Stuart, which started at one of the experimental houses off the beaten track but was shortly transferred to a regular West End theater. This served also to introduce to prominence a young Irish actress, Barbara Mullen, who thus finally arrived in London after an American debut. There was also a new farce, *Nap Hand*, by Vernon Sylvaine. Then followed, as the character of the plays improved,

Emlyn Williams' *The Light of Heart*, hailed as easily the finest new work since the outbreak of the war and a pronounced success with Godfrey Tearle in its leading role; *Cousin Muriel*, by Clemence Dane, which boasted a notable cast including Edith Evans, Peggy Ashcroft, Frederick Leister, and the rising young Alec Guinness; a passionate political and figurative Communist item by Sean O'Casey called *The Star Turns Red*; a dramatization of Daphne du Maurier's *Rebecca* with Owen Nares and Celia Johnson as the protagonists; and *House in the Square*, one of those three-generation sequences, written by a young Welsh actress, Diana Morgan, and presented with Lillian Braithwaite and Margaret Rawlings outstanding in the company. At one or two periods during the season there were more plays current in troubled London than there were in New York.

The annual Shakespeare Birthday Festival was held as usual in the Memorial Theatre at Stratford, opening with a not-too-competent presentation of *Measure for Measure*, soon supplanted by a non-Shakespearean revival of Goldsmith's *She Stoops to Conquer*, but most of the customary summer festivals were cancelled. One interesting occurrence of late spring was the reprieve granted to the famous old Lyceum Theatre, which had been marked for razing. And although from this time on activity in the London playhouses was decidedly irregular, increasing and waning as war-time conditions determined, still a surprising number of new works were cautiously brought out. They included the first regular showing of Bernard Shaw's *In Good King Charles's Golden Days*, seen at Malvern the previous summer; another Vernon Sylvaine farce, *Women Aren't Angels*; a revival of Shaw's *The Devil's Disciple* with the screen actor, Robert Donat, as Dick Dudgeon; Avery Hopwood's *High Temperature*; Robert Ardrey's *Thunder Rock*, which received a heartier welcome than New York had accorded it; Clare Boothe's *Margin for Error*, which, reversely, was found disappointing; *Cottage to Let*, by Geoffrey Kerr, the first play to concern itself with the present war; and *Once a Crook*, a made-to-order item for Gordon Harker. Outside of London the speculative drama of the time of Jesus, *Family Portrait*, reached a British production with Fay Compton and Ursula Jeans as the two principal Marys. Even after the bombing raids afflicted, but failed to dismay, the metropolis, matinee schedules were retained, and Shakespeare's infrequently performed *All's Well That Ends Well* was seen for a few times but was shortly withdrawn in favor of *King Henry IV, Part I*. And even so late as November, after a momentary improvement in general conditions, a new Farjeon revue was brought to light in *Diversion* with no less a stage personage than Edith Evans figuring for the first time in an offering of that type.

Ireland. In Ireland, which, in so far as the drama is concerned, means Dublin, the war served as a positive impetus to the playwrights. For whereas under normal conditions the companies of the two chief theaters, the Abbey and the Gate, spend a goodly portion of their time in touring the nearer European capitals, the existing situation rendered this impossible, and inasmuch as local playgoers had evinced signs of rebellion against seeing the same old familiar repertoire pieces over and over, the only solution of the problem was new plays. Among the more successful new works that resulted were W. D. Hepenstall's farce, *Today and*

*Yesterday*, and *The Rugged Path*, by George Shiels. France. Paris, of course, obviously had little cause or opportunity to be drama-minded after the invasion of France, although early in the year a new work by Henry Bernstein entitled *Ehvre* evoked a wide diversity of critical opinion.

Germany. Berlin, prior to the retaliatory raids by the British bombers, found one of its chief sources of diversion in playgoing. The theaters, however, whether by edict or expediency, confined themselves mainly to the established classics—the dramas of Schiller, Goethe, Ibsen, and Shakespeare pre-eminently—with an occasional political piece for variety. In this last category was the first performance in German of Mussolini's *Cavour*.

**EARTHQUAKES.** Estimates as to the actual number of earthquakes which are felt in some part of the world each year differ widely, partly because seismological observatories are not regularly distributed over the earth's surface. Sieberg has estimated that 9000 earthquakes take place each year and his estimate is considered reliable by many seismologists. Fortunately, most of these earthquakes are either feeble and harmless or else occur under the sea or in thinly populated regions. According to Peterschmidt, during the four months of March to June, 1939, there were 504 earthquakes felt by people or registered by seismographs. Of these probably about one-fourth were of sufficient strength to have the epicenter determined accurately either by isoseismal lines or from instrumental recordings. If Peterschmidt's compilation is representative it means that in an average year there are somewhat less than 400 earthquakes strong enough to have determinable epicenters. It is also difficult to determine the mean annual loss of life caused by earthquakes. Some years ago Davison estimated that in an average year 14,000 people are killed by earthquakes; a couple years later he revised his estimate and reckoned the average number of lives lost each year in the earthquakes of the whole world to be about 28,000. Heavy quakes often occur in remote regions and are known to have happened only from records made by seismographs over the globe; even from

some populated regions direct news is sometimes weeks or months in reaching the rest of the world. In the United States alone more than 200 earthquakes are usually reported annually.

Aside from the Rumanian earthquake, 1940 was characterized seismologically by the rather numerous aftershocks which followed the great earthquake of December, 1939, in Turkey. There were also a few other damaging earthquakes.

On January 17 eight violent tremors were felt in the original area devastated by the December, 1939, earthquake in Turkey and others were also felt at Istanbul, Smyrna, Castamonia, and Izmid. On the preceding day an earthquake occurred at the village of Balıkcıy near Nigde in southern Anatolia; there the death toll was small because most people were out of doors. On the night of January 17 two more shocks were felt at Nigde, causing 400 houses to collapse and killing 50 people. Between 3 a.m. of February 21 and noon of February 24 six villages were destroyed completely and 300 people were killed in Central Anatolia about 150 miles southeast of Ankara. On April 13 there were further aftershocks of the great earthquake of December, 1939; on this day much damage was caused to 15 villages. On July 30 violent earthquakes took place on the central plateau of Anatolia. Twelve villages were destroyed near Yozgad and this shock was also felt at Ankara, Erzinjan, Tokat, Kayseri, Amasya, Sinop, and Istanbul; on this day 300 people were killed and several hundreds were injured. The epicenter was near Yozgad, not far from that of the great quake of December, 1939. It may be doubted that these strong shocks of July 30 were aftershocks of the December, 1939, quake; however, they do show that the region was generally unstable even after the lapse of seven months. Such a terrific quake as that of December, 1939, would naturally give rise to instability which would persist for a considerable time and cause shocks not quite so intense as the original one.

On October 22 a strong earthquake with epicenter near Barlag shook a considerable area in Rumania; in Bucharest it cracked buildings, caused much excitement among the inhabitants (though no fatalities were reported), and otherwise damaged property. This shock turned out to be a fore-shock of a greater quake less than three weeks later. On November 10, a terrific earthquake came in the early morning. Many public buildings were severely damaged; among them were the new 11-story Carlton flats, the building of the Foreign Ministry, the Royal Palace, the Headquarters of the Rumanian Army, and the Post Office. In all, about 200 public buildings were destroyed and 400 damaged besides 1000 badly damaged homes. This earthquake occurred at the time of a heavy rain, and as in nearly all earthquakes in populated areas fires broke out, while in this case basements were flooded which added to the confusion. After the quake and while a heavy rain was in progress, physicians, men of science, engineers, architects, private citizens, members of the Iron Guard, and German Troops searched wreckage for trapped people; many were rescued. The number reported killed in Bucharest was less than 200. Outside Bucharest other areas in Rumania were affected. At Ploësti the earthquake severely damaged the city hall, the Chamber of Commerce building, a hotel, and the Standard Oil Company's offices as well as private houses. The refineries of the Standard Oil Company had to be closed for about two

weeks to repair damage which was caused principally to pipe lines; the Astra Romana Oil Company plant was also severely damaged. Fires also broke out at Ploësti and sulphur fumes came out of ground fissures. At Focsani, an oil town, many houses were destroyed in the center of the town and hundreds of people made homeless. At Giurgiu on the Danube over half of the houses were destroyed. The prison for political prisoners at Dos-trana near Campina collapsed and about 100 were killed. At Galati, the grain and oil port, the cathedral and St. Helen's church were destroyed. Besides the specific damage mentioned in the foregoing places there was severe damage at Buzen, Ramnicue, Sarat, Pangui, Jassy, and in the Prohava oilfields district.

Outside of Rumania at Ruschuk in Bulgaria there was some damage but no fatalities. The shock was felt at Sofia but Ruschuk was the only place in Bulgaria reporting actual damage. It was felt at Istanbul, Turkey, but no damage was reported there. In Russian-occupied Poland buildings were destroyed both at Komárno and Lwow, this may have been due to a separate earthquake nearly simultaneous with the one centered in Rumania. An earthquake, possibly the Rumanian one, was also felt at Moscow on November 10.

The Rumanian earthquake of November 10 reached a maximum intensity of 10 on the modified Mercalli scale. It was the greatest earthquake in Rumania since 1802 but was not as great as the Turkish earthquake of December, 1939, or the Chilean earthquake of January, 1939. The Turkish earthquake of December, 1939, reached intensity 12 on the modified Mercalli scale, the most severe intensity any earthquake attains according to this scale.

On May 18-19 there were fifty people killed and many injured at Mexicali, Mexico, near the border of the United States. Fifteen separate quakes were felt at this time and houses and government buildings were damaged. From the viewpoint of property damage and lives lost this was the most noteworthy earthquake in North America since those at Helena, Montana, in 1935.

There follow a few minor earthquakes which caused some damage. An earthquake of intensity eight on the modified Mercalli scale was felt at Palermo, Sicily, on January 12. It was the most severe one in many years; it temporarily cut off the electrical supply. The great Messina quake of December, 1908, affected this area. Strong earthquakes were experienced on February 1 and 2 in the town of Katerine at the foot of Mt. Olympus on the shores of the gulf of Salonika in Greece; about 120 houses, including schools and other public buildings collapsed. On the night of April 17 a severe quake was felt at Patras at the entrance to the gulf of Corinth and to the north of the island of Morea; considerable damage resulted. On July 15 an earthquake of considerable severity and attended by floods caused havoc in the Chumbi Valley in southern Tibet. Villages from Yatung southward were affected and a stretch of six miles of the telegraph line from Yatung to India was destroyed; all bridges over the Amachu River were demolished and 200 people were killed. The epicenter was near latitude 28° N., longitude 89° E. An earthquake occurred in the western part of the Japanese island of Hokkaido on August 2; more than a thousand fishing boats were damaged by a huge tidal wave which followed this earthquake. The epicenter was between the island of Hokkai-

do and the mainland of Asia. See SEISMOLOGY; also, FOUNDATIONS.

ECUADOR. A South American republic. Capital, Quito.

**Area and Population.** Ecuador's boundary with Peru remains unsettled. The area claimed by Ecuador is officially estimated at 276,007 square miles, including the Galápagos Islands (2868 square miles). Estimated population in 1940, 2,921,688 (about 10 per cent whites, 39 per cent Indians, 41 per cent mixed, and 10 per cent Negroes and Orientals). Estimated populations of the chief cities: Quito, 215,921; Guayaquil, 180,000; Cuenca, 48,300; Ambato, 25,200. United States citizens residing in Ecuador on Jan. 1, 1940, numbered 504; Germans, about 2000.

**Defense.** As of Nov. 1, 1939, there were 5450 men in the regular army, 450 in the air corps, 40,000 trained reservists, and a few small naval vessels. At the beginning of 1940, an Italian mission was instructing the army, a United States mission the navy, and the military aviation school had an Italian instructor (see *History*). Defense budget for 1940 amounted to 26,740,000 sucres (24 per cent of total).

**Education and Religion.** The Indian and mixed races are largely illiterate. School attendance for 1938 was: Primary, 221,031; secondary, 8323; universities, 1475. Education budget for 1940, 18,604,000 sucres (17 per cent of total). Quito has a German college (Colegio Alemán), and an American school, the latter opened in October, 1940. Roman Catholicism is the dominant faith but there is no state religion.

**Production.** While agriculture supports about 90 per cent of the population, minerals produced by foreign-owned companies account for nearly one-third of the value of all exports. Cacao exports in 1939 (about 13,277,808 kilos of 2.2 lb.) represented 22.5 per cent of the value of all exports. The 1939 coffee crop was 12,321,330 kilos. Bananas, cereals, fruits, vegetables, sugar, and cotton also are grown. The forests yield tagua nuts, rubber, balsa wood, and kapok. Mineral production in 1939 was: Petroleum, 2,313,000 bbl.; gold (Central Bank purchases only), 1,152,148 grams; silver, 3.6 metric tons. Straw hats and small quantities of textiles, paper, leather, banana flakes, and flour are the chief manufactures.

**Foreign Trade.** Imports in 1939 were valued at 147,860,226 sucres (148,314,911 in 1938); exports, 164,840,543 (169,095,627 in 1938). The value of the chief 1939 exports was: Cacao, 37,031,000 sucres; cyanide precipitates (chiefly gold, with some silver, lead, and copper), 26,404,000 sucres; petroleum and its products, 25,005,000 sucres; gold bar and coin, 14,893,000 sucres. Of the 1939 imports, the United States supplied 49.1 per cent (37.5 in 1938); Germany, 6.8 (17.5); France, 6.6 (8.0). Of the exports, 48.7 per cent went to the United States (34.6

in 1938); 18.1 to Germany (24.1); 5.5 to the United Kingdom (7.7).

**Finance.** Ordinary revenues and expenditures for 1941 were estimated at 117,200,000 sucres (113,050,000 for 1940) and extraordinary revenues and expenditures at 8,702,000 sucres (8,025,000 for 1940). Actual ordinary revenues in 1939 were 117,187,000 sucres and expenditures, including the deficit of nearly 8,800,000 sucres in the 1938 budget, were 121,925,000 sucres. Foreign debt on June 30, 1939, \$26,470,000; internal debt on Dec. 31, 1938, 25,624,525 sucres. Average exchange rates of the sucre in 1939 were: Free bank rate, \$0.06671 (\$0.07027 in 1938); Central Bank rate, \$0.06743 (\$0.07077).

**Transportation.** Ecuador in 1940 had about 775 miles of railway line, 3852 miles of highways, and two air systems (Pan American-Grace and the German-controlled Sedta lines) linking the principal cities. On June 11, 1940, the Sedta system extended its line between Quito and Guayaquil to Loja in the southwest (see *History*). During 1938 473 vessels entered Guayaquil, the leading seaport.

**Government.** The political situation in Ecuador became increasingly confused after the military coup d'état of 1925. After 1929 continual friction between President and Congress led to frequent revolutionary outbreaks and a succession of provisional governments, ruling largely by decree. The Constitution of Mar. 26, 1929, was annulled on Sept. 27, 1935, and the 1906 Constitution provisionally restored by executive decree. A Constituent Assembly adopted a new Constitution Dec. 1, 1938, but the Congress elected on Jan. 15, 1939, promptly annulled it and the government restored the 1906 Constitution. On Nov. 14, 1939, Provisional President Aurelio Mosquera Narváez died in office and Dr. Carlos Arroyo del Río, President of the Senate, became Acting President. He resigned Dec. 11, 1939, to become a Presidential candidate in the election set for Jan. 10-11, 1940, being replaced by Dr. Andrés F. Córdova. See below for 1940 developments.

## HISTORY

**Internal Politics.** Ecuadorean politics continued their stormy course during 1940, while economic conditions became steadily worse as a result of the European War. At the same time the conflict between the United States on the one hand and Germany and Italy on the other for strategic positions and dominant political influence in Ecuador grew in intensity.

The election arranged in 1939 (see *YEAR BOOK*, 1939, p. 210) was held as scheduled on Jan. 10-11, 1940. The Liberal-Radical candidate, Dr. Arroyo del Río, received 32,000 votes as against 20,000 received by former President José María Velasco Ibarra, candidate of independents, Socialists, and others, and 14,000 counted for Jacinto Jijón Camacho, the nominee of the Conservative party. Dr. Córdova continued to serve as Acting President until Congress certified Dr. Arroyo del Río's election on August 17 and he was inaugurated as constitutional President on September 1.

In the meantime there was a series of unsuccessful revolts and anti-government conspiracies. During the night of January 11-12, followers of Velasco Ibarra in Guayaquil declared the election a farce and, led by a number of army aviators, staged an uprising that was quickly suppressed. The army remained loyal and an attempt to launch a general strike failed when the strikers were giv-

en 24 hours to return to work or forfeit the protection of all labor laws. The Council of State granted Acting President Córdova emergency powers for 90 days to deal with political disturbances. Velasco Ibarra was released from jail upon his acceptance of a government offer of exile, and went to Medellín, Colombia.

On January 27 another abortive revolt broke out at Esmeraldas, apparently directed against provincial officials accused of pilfering municipal funds. Amnesty for all those involved in the January 12 uprising, except Velasco Ibarra and a few other ringleaders, was proclaimed on March 21. A few days later (March 28) conspirators attempted to seize the artillery barracks in Quito and overthrow the government. This attempt, likewise attributed to Velasco Ibarra, was easily suppressed, and the emergency powers granted the government in January were extended. A month later the police raided the Quito residence of another former Provisional President, Gen. Alberto Enríquez, who headed a dictatorship in 1937-38. Seventeen Enríquez followers were arrested on charges of plotting a revolt. General Enríquez was subsequently exonerated of complicity.

**Economic Trends.** On January 1 Acting President Córdova repealed the exchange control system under which an attempt had been made to restrict imports in accordance with declining exports. The result was that imports continued at a high level, while exports steadily dwindled due to the loss of further export markets in Europe. The growing shortage of foreign exchange to pay for excess imports caused a drain on the gold reserves of the Central Bank and the rapid depreciation of the sucre. Due to lack of exchange, the Central Bank on April 26 abandoned the stabilized rate of 15 sucres to the dollar, which it had quoted since May 29, 1939, and in subsequent weeks the sucre depreciated to 22 1/2 to the dollar.

Forced to reverse its policy, the government re-established exchange control on June 4, placing all operations in the hands of the Central Bank. The customs tariff on a large number of imports was increased June 6. On June 13 quantitative restrictions were imposed on imports of numerous articles during the next six months. The decree of June 4 also revalued the gold holdings of the Central Bank at 16.69 sucres per troy oz., and the profits accruing from revaluation were set aside in a special fund for the stabilization of the sucre. Industrial production had been declining as a result of the adverse economic situation, while the cost of living had risen due to depreciation of the sucre. The government attempted to check this trend by stabilizing the sucre and by a decree of June 15 forbidding factories to increase the selling prices of their products without special authorization by the Minister of Industries. Efforts were also made to balance the budget by reducing expenditures. These steps caused the sucre exchange rate to improve to about 15 sucres per dollar by December 31.

Economic conditions remained difficult, however, and a severe shortage of wheat and rice developed. To meet this situation Congress on September 24 authorized the President to negotiate a \$1,150,000 public works loan from the Export-Import Bank in Washington. Revision of the restrictive measures adopted against foreign corporations during the Enríquez dictatorship (see YEAR BOOKS, 1937 and 1938) was undertaken to encourage foreign capital. To promote national production, an emer-

gency decree was issued exempting agricultural and industrial machinery and certain raw materials from the 50 per cent import surtax. A decree of November 14, issued with the approval of the Council of State, authorized the President to issue emergency decrees of an economic character as circumstances warranted.

**Relations with United States.** Ecuador received aid from the United States in meeting its economic problems. On June 4 the Export-Import Bank at Washington announced the extension of a \$1,150,000 credit to Ecuador for highway construction, purchase of railway equipment in the United States, and research on the republic's disease-ridden cacao industry. The State Department at Washington announced June 15 that it had agreed to temporary modification of the reciprocal trade agreement of Aug. 6, 1938, with Ecuador to permit the Quito government to impose quota restrictions on imports.

Washington also sought the co-operation of Quito in curtailing German activities in Ecuador and in preparing to defend the southern and western approaches to the Panama Canal. It was disclosed in Washington May 26 that an army officer and a naval officer had been sent to Ecuador at the request of that government to confer on "general Western Hemisphere defense." Reports from Guayaquil stated that these officers submitted proposals for American help in unifying and reinforcing Ecuadorean land, sea, and air forces, particularly at the virtually defenseless but strategically important Galápagos Islands.

At the end of May it was reported that Washington was negotiating with Ecuador for the elimination of the German-operated Sedta Airline, which placed German planes and pilots, who were reservists in the Reich air force, within striking distance of the Panama Canal. The Quito authorities refused a request of the Sedta company for permission to establish an air service to the virtually uninhabited Galápagos Islands but demurred at closing the Sedta lines in Ecuador, operated at a large annual deficit covered by the German Government. On November 16 Pan American-Grace Airways started competition with the Sedta lines with a weekly service between Quito and the provincial cities of Esmeraldas, Manta, Salinas, and Guayaquil.

At the request of the Quito Government, the U.S. aircraft tender *Sandpiper*, with two naval planes, mapped the Ecuadorean coast from the air during June and July. In August, the U.S. gunboat *Erie* and destroyer *Tatnell*, commanded by Rear Admiral H. K. Hewitt, visited the Galápagos Islands with a group of Ecuadorean army, naval, and air officers, appointed by the Minister of Defense, to study the feasibility of a hemisphere defense base there. The contract of the Italian military mission was rescinded on December 4 and on December 12 an agreement was signed in Washington whereby the United States undertook to send a naval mission and a military aviation mission to advise the Ecuadorean navy and air force. On December 24 the Minister of Defense instructed the military and naval forces to devote two hours weekly to instruction in English. Two decrees promulgated December 28 established universal military instruction for all citizens between 18 and 50 and pre-military instruction in all schools, colleges, and universities.

**Boundary Controversy Revived.** These defense preparations were inspired partly by the de-

sire to co-operate in the inter-American hemisphere defense program and partly by the revival of the long-standing boundary dispute with Peru, which had repeatedly threatened to involve the two countries in war. In December the Ecuadorean press placed great emphasis upon reports of alleged Peruvian encroachments upon the disputed area. This revival of tension handicapped the efforts of a joint Ecuadorean-Peruvian commission to agree upon a temporary boundary line pending a final settlement of the controversy.

**The Propaganda Battle.** The strengthening of United States influence in Ecuador was accompanied by a violent propaganda battle between the pro-democratic and anti-democratic forces in the republic. The influential German colony, led by Nazi agents, led the attack upon the United States. Washington was accused of scheming to establish control over Ecuador on behalf of "Yankee imperialism." This charge was echoed by the Conservative party in Ecuador and by some officials and army officers. The majority of Ecuadoreans, however, appeared sympathetic to the United States and to the Allied cause in the European War.

Charges of widespread Nazi infiltration and propagandist activity, made before a secret session of Congress in September, was followed by a Senatorial investigation. On September 25 the government asked Congress for wide powers to expel suspected propagandists and on December 22 a Guayaquil newspaper reported that the government had expelled the head of the German school in Quito. To counter the activities of several pro-Nazi publications, a pro-democratic propaganda organ, *La Defensa*, was established by Sen. Filémon Borja, leader of the anti-Nazi campaign in Congress.

Liberal circles in Ecuador severely criticized a Spanish educational mission of seven pro-Fascist professors, which arrived in Ecuador in September. The Franco Government of Spain had offered to send the mission at its own expense and this offer was accepted by the Córdova administration. Anti-Fascists demanded that the Arroyo del Río Government cancel the mission's contract.

See FASCISM; PAN AMERICANISM.

**EDUCATION.** The war is exercising a profound influence on education in every part of the world. Negatively, education is being curtailed in belligerent and occupied countries. Where they are exposed to attack, children are being taken away from their homes to places of safety. While measures are being adopted wherever possible to provide the young refugees with education, there is inevitable disturbance in their schooling. An even more marked effect is appearing in occupied countries. In Poland, for example, the native population is allowed to attend only elementary schools and trade schools. The Polish secondary schools and universities have been closed. The German population transferred to Poland is being provided with secondary education. The German Minister of Agriculture in an address reported in *The New York Times* declared it to be the policy of the Third Reich to limit all conquered peoples to meager education, to consign them even to illiteracy, while only Germans are to have higher education.

On the positive side the war is resulting in the employment of education in many countries as a means of propaganda for the acceptance of extreme forms of nationalism and as a means of preparation for participation in military and industrial activities. As far back as 1934 Marshal

Pétain in a public address deplored the failure of education to cultivate in young people in France what he called "patriotism." He charged that "our educational system pursues as its sole aim the development of the individual considered as an end in himself. The members of the teaching profession devote themselves quite openly to the end of destroying the State and society." He recommended the reconstruction of the whole educational system and the adoption of an educational policy "binding the school and the army closely together." "The army," he said, "the crown of national education, would, with its lofty lessons of equality, solidarity, discipline, and self-denial, sow the seeds of the welfare of society and the superior interest of the State." The trend of education in unoccupied France is easy to prophesy in view of the Marshal's strong convictions. In such countries as Norway and Greece children are being drawn into patriotic services, even into services of direct assistance to the armed forces. In Germany itself the old *Gymnasium*, with its devotion to the classical curriculum, is being overshadowed by the new secondary school which Hitler favors, the *Deutsche-oberrealschule*. This new secondary school teaches the students nationalism, race biology, and science as substitutes for the traditional courses in the languages.

In the United States the schools and colleges are rapidly being drawn into co-operation with the defense program. It is true that the new trend has not yet changed to any great extent the conventional program of instruction in the elementary schools or in the majority of the secondary schools, but there is much vigorous discussion going on which will quite certainly affect the work of all educational institutions both with respect to the contents of the curriculum and with respect to the methods of teaching.

An important document issued by the American Youth Commission of the American Council on Education under the title *What the High Schools Ought To Teach* presents a program for the reorganization of American secondary schools. This program is sponsored by ten leading students of education and administrators of public schools. It opens with a historical account of the steady movement of American secondary education away from the pattern of European education of the same level. This movement began with the pronouncement made by Benjamin Franklin in 1749 and has gained in momentum as the pupil registration in secondary schools has increased since 1880 to the point where now it includes two-thirds of the adolescent population of the country. This movement has led to emphasis on the natural and social sciences and on the various technical subjects.

The report lays stress on the importance of continuing in the secondary school the training in reading which begins in the elementary school. The reason for continuing this training is that it equips the advanced pupil for independent acquisition of the great body of intellectual material to which the school can introduce him but for which institutional education must always be too limited in time to provide anything like complete coverage.

The second contention of the report is that education must in all cases provide for the cultivation of manual skills. Education has in the past been negligent in cultivating manual skills with the unfortunate social consequence that a wide breach has developed between labor and intellectual activities. The healing of this breach is regarded as of

major importance if pupils are to be properly prepared for the life of a modern community.

The third point made is that the school curriculum needs to be enriched by the inclusion of far more social instruction than has been included in times past. It is pointed out that the deficiency in social studies is due to the historical fact that in earlier times the home was able to give young people all the education which was necessary for an understanding of the simple forms of community organization that constituted the social environment. The growing complexity of modern political and economic life has changed the situation and has created the obligation for a treatment in schools of all phases of social organization.

After emphasizing these areas in which the curriculum needs expansion, the report enters into a vigorous criticism of the courses that deal with traditional subjects. Perhaps the spirit of the criticisms made can best be illustrated by quoting a part of the section of the report which deals with the instructional program of the ninth grade of the typical high school:

Pupils in this grade come from the general curriculum of the elementary school or from the liberal curriculum of the junior high school where exploratory courses have opened up many avenues of interest. The ninth grade puts an end to all general studies. It is essentially a period in which every course is designed as preparation for what is to come later. The courses of the ninth grade are seriously lacking in direct appeal to pupil interests. The curriculum of this grade includes required courses in English composition and algebra, and two or more courses from the following: foreign language, science, history. English composition and algebra are commonly regarded as very difficult and are sure to discourage pupils who are not "academically-minded." Of the three other courses, foreign language is commonly insisted on, and history is often ancient history.

It would be difficult to devise a more uninviting year's study for adolescents. The number of young people who are turned away from the pursuit of learning by this program is so large that it seems legitimate to conclude that there must be something radically wrong with a curriculum that runs directly counter to compulsory school attendance laws and to the purposes which a public school ought to serve in an age when young people are forced into schools by economic and industrial conditions.

Suppose that it is assumed for a moment that adolescents are, in a large number of cases, going to attend secondary schools for only two years or less, what can be offered them in order to stimulate them to the maximum? If this question is to be answered in the spirit of a genuine interest in young people, rather than in the spirit of devotion to tradition, certainly one should select for the ninth grade the most captivating studies that can be found and those which will most surely set the learners on the way to adulthood equipped to meet its problems. No one who has talked with young people and learned what they are thinking about can possibly believe that English composition, as commonly taught, and algebra would be chosen by many of them if they had any voice in the selection.

The document from which the foregoing quotation is taken naturally aroused the antipathy of the teachers of the languages. They perhaps more than any other group of educators have vested interests in the curriculum as now organized. It is not surprising that opposition to the report published by the American Youth Commission should come from organized language teachers. The following quotation from *School and Society* of Dec. 14, 1940, shows the attitude of these specialists.

Inasmuch as a pamphlet—"What the High Schools Ought to Teach"—sponsored by the AYC and prepared by a committee of five professors of education, three city superintendents of public schools, one high-school principal, and the director of an industrial institute, contains radical criticisms of the "conventional subjects," English, mathematics, foreign languages, natural sciences, and history, it seems highly important to teachers of foreign languages that a committee making such a report should not be dominated by professors of education and educational administrators, but should comprise "representatives of the general public, of parents, of business and professional

life, of the intellectual leadership of this country and . . . of the so-called 'traditional subjects' of English, mathematics, foreign languages, history, and natural sciences, . . . 'exact and exacting' studies which contribute to an understanding of the world in which we live and at the same time help to provide knowledge and skill vital to any program of national defense."

A second important development in the field of secondary education is outlined in a pamphlet published by a committee of the National Association of Secondary School Principals. This pamphlet is entitled *The Occupational Follow-up and Adjustment Service Plan*. The pamphlet recommends that secondary schools continue to interest themselves in their pupils after they have left school either through graduation or through withdrawal before graduation. In the past secondary schools have in general not regarded themselves as in any way responsible for individual pupils after they leave school. The efforts of the Federal Government, through the Civilian Conservation Corps (q.v.) and the National Youth Administration (q.v.), to take care of young people between the ages of eighteen and twenty-five who are out of school and unable to secure employment have proved beyond question the necessity of attention by public agencies to some form of post-school assistance and guidance of young people. The secondary schools are gradually coming to a recognition of the fact that it would be of advantage to themselves to find out how well their products succeed in the practical life into which they enter after school days. There will need to be much more attention to out-of-school youth than has ever been given in the past. The program of personnel study and guidance presented in the pamphlet mentioned is quite in harmony with the growing practice in all defense agencies to regard training and adjustment as important for older workers as well as for youth.

The defense program has resulted in the adoption of an adult-education program of large proportions. When the President of the United States organized the National Defense Advisory Commission (q.v.), he assigned to one of the members of the Commission, a labor leader, the specific duty of dealing with personnel and training. It is the duty of this member of the Commission to see that industry is supplied with the workers that are required to carry on its operations. Where there is a deficiency of workers in any particular line, a program of training is to be conducted. The Defense Commission turned naturally to the educational system of the nation for help in its training program. The U.S. Office of Education (q.v.), through its vocational division, responded to the call and enlisted the co-operation of technical schools and engineering schools. The first steps in the program for the training of workers were taken during the summer of 1940, when vocational schools, in accordance with their usual practice, were closed. These schools were kept open, the expenses being met with Federal funds drawn from the appropriations made by the Congress for defense. The summer sessions of the technical schools were conducted for the double purpose of preparing skilled workers and reducing the country's relief rolls. The trainees were drawn in the first instance from the relief workers enrolled on WPA projects. They were drawn in the second place from the registrants in the Federal Employment Agency. Some of the courses were intended to bring to a high level of skill the technical abilities of men who had once worked in mechanical trades

but who, through a period of unemployment, had lost some of these skills. The courses for such workers were called "refresher courses." Other courses were designed for men, young or old, who had never worked in mechanical trades but could be made competent by a short course in some particular line, such as the manipulation of a drill press.

It was pointed out by critics of the summer courses thus organized that very little was being done for the young people for whom the technical schools were organized by local communities. A partial answer was given to this criticism by the statement that one of the most urgent needs of the country was to get older workers into employment. Furthermore, it was promised that in the autumn the Defense Commission would stimulate an expansion of instruction of secondary-school grade which would reach adolescent youth.

The promise has been fulfilled in the regular sessions of the schools. These have been supplemented by instructors and materials supplied through the Office of Education and by a program of co-operation between schools and the National Youth Administration. The Congress made an appropriation of \$50,000,000, \$7,500,000 of which is being spent by the Office of Education to provide courses in schools for the youth employed on National Youth Administration projects; the remaining \$42,500,000 is being spent by the National Youth Administration in organizing supplementary centers for the training of mechanics.

While these adjustments were being made in the secondary schools, a movement was being inaugurated in the engineering colleges. These schools were greatly stimulated by a statement of the President in which he pointed out that national defense requires training of various forms other than direct military drill. He referred to medical training and training of engineers. The engineering schools have found, and in recent months industrial establishments have found, that it is not possible to turn out fully trained engineers fast enough to meet the demand. Resort has been had to various means within the industries and within the training institutions of utilizing to the full the services of such trained engineers as are available. The device most commonly adopted is to associate with an engineer of the highest type a number of workers who can be prepared through a short course to work under direct supervision on some highly specialized aspect of an engineering job.

It has been said by some who object to this method of speeding up induction into mechanical activities that the individual is being sacrificed to the emergency, that everyone has the right to as much training as may be necessary to carry him to the upper levels of his trade or profession. To such objectors it has been replied that in practical operation industry is providing a corrective to any limitations in the present educational program. Industry is so urgently in need of workers who are competent to operate independently in the more highly skilled activities that it is compelled to open up lines of promotion from the lower ranks to those who show promise. Perhaps the most important outcome of the whole speeded up program of education will be a general realization of the necessity of keeping open the avenues of individual improvement throughout the whole of one's career.

The conscription of the young men of the nation promises to be highly significant for education. Before the conscription act was passed the President

made the recommendation that every young person, male or female, be called on as a part of his or her preparation for adult life to serve for a year or more contributing to public welfare. An order later issued with respect to the application of the conscription act showed that the President's idea is still alive. Conscientious objectors to military service have been told that their scruples will not exempt them from public service. There are so many needful activities in national defense other than the carrying of guns that conscientious objectors can be fully employed in operations to which no objection can be made. All will therefore be conscripted whatever their beliefs.

The President has taken another step in the direction of co-ordinating the efforts of the government in the preparation of the people of the country for all emergencies. He has assigned to the administrator of the Federal Security Agency, who in 1939 was appointed to co-ordinate the welfare activities of the nation, the duty of engaging in a vigorous program for the promotion of public recreation and health. Since the administrator has in his agency the United States Office of Education and the Public Health Service as well as the National Youth Administration and the Civilian Conservation Corps, it is clear that this new assignment is designed to speed up and improve the educational, health, and total welfare program of the nation.

A significant step toward closer co-ordination of education and government was initiated by the educational institutions of the country. It is a fact vividly in the minds of older educators that, when the United States entered the first World War, there was chaos in education, especially in the colleges. No one knew how the colleges and schools could be of service. Experiments in utilizing the colleges as military camps were tried with results that proved to be seriously unsatisfactory. With the resolution that the mistakes of the earlier period should not be repeated, educators organized as soon as the President declared that there is an emergency and asked the government to set up a liaison committee which would define what schools and colleges could and should do. The first committee that was appointed to meet the request of the educators proved to be less representative of all branches of the education profession than seemed to many to be desirable. A second effort, which aimed to secure satisfactory representation, was made by bringing together delegates from fifty-nine educational organizations. These delegates, after deliberation, assigned to the president of the American Council on Education and the executive secretary of the National Education Association, acting as co-chairmen of a general education committee, the appointment of a representative committee. Such a committee, consisting of nineteen persons, was appointed. This committee is studying all aspects of the situation and preparing reports which will aim to guide the operations of educational institutions if the emergency deepens. Fortunately, the Army has of its own initiative reached certain decisions which make the outlook much less confused than it was in the period of the first World War. The Army does not intend to organize training classes in the colleges as it did in 1917 in the S.A.T.C. There are now enough trained officers in the Army to take care of the first needs.

One phase of the international relations of the United States which has been much discussed in educational circles is the relation of this country

to the Latin-American nations. The State Department organized early in 1940 a conference on cultural relations to which representatives of the countries of South and Central America were invited. The outcome of this conference was the appointment of several standing committees which are active in promoting cultural relations in the Western Hemisphere. Among these are committees on education, music, and art. It has been recommended in many quarters that schools and colleges contribute to a more sympathetic understanding in this country of Latin-American civilization by giving courses on the history and culture of countries south of the Rio Grande.

One topic on which teachers of all levels are especially sensitive is their freedom to carry on investigations and to teach what they believe to be the truth without restraints of any kind. Teachers hold that the tradition of academic freedom was at one time fully accepted by civilized countries and must now be regarded as one of the most precious heritages of democratic countries since it seems to have been abandoned in many parts of Europe.

The members of the faculty of Columbia University were greatly agitated when the president of that institution called them together and said to them, "Before and above academic freedom of any kind or sort comes . . . university freedom, which is the right and obligation of the university itself to pursue its high ideals unhampered and unembarrassed by conduct on the part of any of its members which tends to damage its reputation. . . . Those whose convictions are such as to bring their conduct in open conflict with the university's freedom to go its way toward its lofty aim should, in ordinary self-respect, withdraw of their own accord from university membership." Several members of the faculty, after listening to this pronouncement, wrote to the president asking for amplification of his meaning. The president answered the letter of inquiry, pointing out that he had always defended the academic freedom of members of the Columbia faculty and making the following explicit statements.

The phrase academic freedom, as defined two hundred years ago when it first came into use, has always had a very definite meaning. Its application is restricted to the work of professors and scholars. Student freedom is, therefore, a separate thing from academic freedom. Like academic freedom, however, student freedom carries with it a responsibility to safeguard the good name of the university.

The conduct outside the university of a member of any faculty is for the individual himself to control. He should, naturally, do all in his power to avoid doing anything to injure his university's reputation.

The off-campus conduct of the sincere isolationist or honest critic of the national policy of defense is protected by our ordinary American doctrine of civil liberty and ought, therefore, to be free from persecution.

The references to the private lives of members of the faculty and to the rights of students are of special interest in view of other happenings in the academic life of New York City. Earlier in the year the trustees of the College of the City of New York had stirred up a violent controversy by appointing to a professorship the eminent English philosopher and logician, Bertrand Russell. The views and practices relating to matrimony of this scholar, whose competence in his field is universally recognized as of the highest order, are of an unconventional character. The public discussion of Professor Russell's private affairs led to action brought in a New York court by a taxpayer of the city. In an extraordinary ruling the judge declared

Professor Russell unsuitable for the post to which he had been appointed. This ruling brought a storm of protest from leaders in universities in all parts of the country. Professor Russell was later appointed to a highly satisfactory position by an art foundation in Philadelphia.

The College of the City of New York had another upheaval when the trustees invited the president of Reed College to accept the presidency of the New York institution. Exception was taken by some citizens to the record of this appointee in dealing with labor disputes, and he refused to accept the invitation of the trustees. In Brooklyn College as well as in the College of the City of New York trouble arose. The president of Brooklyn College testified at a public hearing that organized efforts were made by certain communist students to gain control, through illegitimate means, of the student organizations of the College. When he nullified the efforts of the communists, a systematic but unsuccessful effort was made to disorganize the institution. The members of the defeated group took the position that their academic freedom had been curtailed.

On the whole, it can be concluded that these incidents and the public discussion of their meaning for the intellectual life of the nation have reinforced rather than injured the cause of freedom. The very fact that discussion is unrestricted is evidence that in this country there is an abiding conviction that restraints of a legal or political character should never be imposed on the thinking of the people. The concept of freedom in the United States is far more comprehensive in its scope and application than is the concept of academic freedom. So long as the broader interpretation of freedom persists there is little danger of any serious infraction of the rights of scholars to investigate and teach.

A further gratifying indication of the enlightened view which the American public takes of its educational system was given in the report of a survey made by the American Institute of Public Opinion under the stimulation of a committee of the American Youth Commission of the American Council on Education. Adopting its standard practice of polling public opinion, the Institute asked questions such as these: "Many people say there is too much importance placed on education these days. Do you agree or disagree?" "Do you think young people today are getting a better education in school than their parents got?" "If a family is so poor that they have to keep their children out of high school, do you think that they should be given aid by the government so that the children can attend high school?" The people who were asked these and other questions were asked whether costs of education are too high and whether the high school is too much concerned with preparing pupils for college.

The outcome of this poll makes it perfectly clear that the typical citizen of this country is enthusiastic about education and convinced that schools deserve support on a scale even larger than is now provided. Anyone who has noticed the attacks which have been made on school support in recent times will be encouraged to believe that, when the economic stress which has gripped the nation in recent years is relieved, there will be an expansion of the educational system.

With reference to the relation of the high-school curriculum to college preparation, evidence has been accumulated by the Progressive Education

Association which lends support to the conclusion reached in a number of recent investigations that it is far more important that a high-school pupil acquire good habits of study than that he become acquainted with any particular subject. Some years ago the Progressive Education Association secured the approval of some two hundred colleges to a plan under which they would admit students recommended by thirty selected secondary schools without regard to the satisfaction of any specific entrance requirements. The plan has now been in operation long enough so that a considerable number of students admitted under liberal conditions have completed their college careers. On the whole, the students admitted under the plan described have taken ranks in college above the average. It is, of course, to be recognized that the students to whom this statement applies are selected individuals. Not only so, but the schools in which they received their secondary education are superior institutions. The experiment does not supply final proof that entrance requirements are indefensible, but it presents an argument for liberalism that has not been by any means universally accepted in the past.

Perhaps the most urgent need for a revision of the practices of schools appears in the cases of highly gifted pupils. The pace set in schools is determined in large measure by the average, or mediocre, pupil; it does not in most cases provide adequate incentives for study for the brightest members of the pupil body.

Teachers College of Columbia University recently organized a conference at which were presented the views of leading educators and laymen on the desirability of special adjustments in schools for children of the higher levels of ability, especially those who on the basis of scientific tests are to be classified as belonging to the genius group. One interesting and illuminating feature of this conference was the presentation of their experiences by a number of adults who in the period of their schooling had shown high intelligence quotients. The testimony of these especially bright people showed that their education had by no means fitted them for success in life. Not merely were they unequipped to take full advantage of their native endowments, but they were often actually handicapped by the perverted channels along which the schools had directed their intellectual efforts. It is clear that the schools must plan education of a type different from that now provided if young people of the highest ability are to be well prepared for life.

Something of a sensation was created in the university world by a statement made in his annual report by Pres. Frederick P. Keppel, of the Carnegie Corporation of New York. This corporation has played so important a part in establishing pensions and insurance for university professors and in subsidizing research projects of many different types that conclusions relating to the financing of university enterprises that issue from the experience of the Corporation are of general interest to all members of the academic profession. Mr. Keppel is sure to be listened to when he makes such a statement as the following.

With rare exceptions a foundation can reach its objective only by working through another institution, and there are today in the United States far more universities, colleges, and other operating institutions, and far more voluntary organizations for worthy purposes than the nation can possibly afford. In the years to come many of these are bound to disappear, and one of the most difficult duties that face the foundation is that of so directing its grants

that its influence will be directed toward the survival of the fittest.

CHARLES H. JUDD.

**EDUCATION, U.S. Office of.** Continuing to carry out the mandate given it by Congress in 1867 to collect and disseminate educational facts and statistics and otherwise "to promote the cause of education," the U.S. Office of Education during 1940 rendered service to and for American education in many ways.

*Administration*—Studied the organization of State departments and boards of education, their functions in organizing and administering the educational program, and practices in city school administration.

*School Finance*—Published digests of plans for financing public education in Florida, Minnesota, Rhode Island, Texas, Washington, and West Virginia. Surveyed State financing of public education.

*School Law*—Digested and analyzed State laws governing distribution of power and control over education in State offices and agencies, State and national legislation, court decisions affecting education.

*School Building*—Began study of school building work and trends in school building construction throughout the United States.

*Elementary Education*—Prepared and issued a publication entitled, "Elementary Education, What Is It?," based upon conference discussions with elementary school supervisors. In progress is a study, "The Release of Public School Pupils During School Hours for Religious Instruction."

*Secondary Education*—Prepared report on State supervision of secondary education and bulletin, "Statistics of Public High Schools, 1937-38." Co-operated with Committee on Implementation of Studies in Secondary Education, and the National Committee on Co-ordination and Co-operative Study of Secondary School Standards.

*Higher Education*—Co-operated with Department of State Cultural Relations Division in selecting students and teachers for exchange between the Latin American republics and the United States. Entered upon second year of the Survey of Higher Education of Negroes. Studied and published series of articles on Federal Government Schools. Revised publication, "Federal Laws Relating to Land-Grant Colleges and Universities"—laws which are administered by the Federal Security Agency through the U.S. Office of Education. Studied problems relating to administration of higher education in finances, accrediting of post secondary schools. Published bulletin on accrediting practices in 30 selected States. Studied administration of State teachers colleges and other institutions engaged in training teachers for the schools. Stimulated programs of study to prepare leaders for work in education. Co-operated with Association of American Universities in improving

standards in graduate schools, and in its preparation for a study of selection of students by graduate schools. Studied organization and activities of college placement services to learn of placement successes, and how contacts of services with employers reacted to accomplish a better adaptation of college curricula to employment needs. Ascertained the extent to which schools of engineering could be of assistance in training men needed by government and industry in the national defense program. (See *National Defense* under this article.)

*Parent Education*—Studied parent education services of State Departments of education, and parent education activities in parent-teacher programs.

*Public Forums*—Sponsored Federal Forum Project which aided in organization of public forums in 21 States—total number seeking adult civic education at these forums, one half million persons. Principal emphasis in discussions—problems of national defense.

*Rural Education*—Studied supervision of adult education and out-of-school-youth. Issued publications on rural high school curriculum, community centered schools, correspondence study, one-room schools. Promoted activities of the Future Farmers of America now enrolling 227,500 boys studying vocational agriculture in 6500 public high schools of 47 States, Hawaii, and Puerto Rico.

*Exceptional Children*—Studied State supervision of education of exceptional children and compiled statistical data on special schools and classes for exceptional children. Endeavored to bring into closer relationship State departments of education and State training schools.

*Negro Education*—Prepared publication on the relation of occupational status of Negro high school graduates and non-graduates to certain school experiences. Listed references on life and education of Negroes. Completed study of Negro education supervision by State departments of education. Began study of higher education of Negroes.

*Territorial Education*—Studied and issued publication on education in the Panama Canal Zone—one of a series of U.S. Office of Education bulletins on education in our territories and insular possessions.

*Visual Education*—Inventoried college courses available to teachers of visual education. Studied sources of visual materials and equipment suitable for school work. Prepared educational exhibits for major national educational conventions. Terminated services of all Film Service staff members on June 30, 1940. Congress did not appropriate funds to continue the Film Service staff beyond this date.

*Radio Education*—Provided service through the Educational Radio Script Exchange to more than 1200 producing groups. Expanded the Exchange to include educational transcriptions. Distributed upon request 35,000 copies of radio scripts, 11,000 radio manuals, handbooks, and courses. Serviced 12,000 educational and civic organizations and radio stations through this Exchange. Allocated funds to schools and colleges for radio education demonstrations or studies. Continued co-operation in broadcasting "The World Is Yours," educational radio program. Received three major radio awards for educational radio service. Represented American education's interests in urging Federal Communications Commission to retain educational band on ultra-high frequency channel for use by educational institutions. Secured continued reservation

of band which uses frequency modulation method of transmission.

*Library Service*—Provided 38,000 educational books and 1200 theses through U.S. Office of Education library for reference and reading use. Increased collection of theses received from colleges and universities to nearly 4000. Made statistical surveys of public libraries, college and university libraries, and studied State agencies providing library service. Began survey of library facilities at various public housing projects. Prepared pamphlet, "Know Your School Library."

*Statistical Service*—Compiled statistics covering more than 266,000 schools. Worked toward simpler and more uniform school records and reports. Formulated census questions for 1940 on education.

*Comparative Education*—Evaluated educational credentials of 1160 students, highest number in 15 years, including those of many refugee students and professional workers from many countries establishing themselves in the United States. Evaluated credentials submitted by 190 colleges and universities in 39 States, the District of Columbia, Canada, and Philippine Islands. Studied educational offerings in Cuba. Translated educational records from 36 different languages.

*Conservation Education*—Prepared bulletins on conservation education, including elementary school conservation curriculum and list of colleges and universities offering courses for teachers in conservation education.

*Publications Service*—Prepared and issued 80 new publications reporting research findings on educational problems.

*Trade and Industrial Education*—Continued emphasis upon making more adequate provision for trade training in non-urban areas being met by establishment of county, sectional, or State trade schools. Continued study of trade-school graduate placement. Encouraged joint educational projects between State and local boards for vocational education, WPA, NYA, and the CCC. Focused attention upon opportunities for training in diversified occupations courses.

*Home Economics Education*—Encouraged out-of-class experience for prospective home economics teachers in college training classes. Emphasized education for home and family living, and the need for more research in home economics education.

*Distributive Education*—Urged State employment of itinerant instructors to conduct distributive education courses in small cities and rural areas. Directed training program toward small store employees.

*Agricultural Education*—Aided in increasing number of high school courses in vocational agriculture from 7665 in 1939 to 8300 in 1940. Stimulated development of long-term programs of research in States. Endeavored to find openings in farming for out-of-school farm youth.

*Public Service Training*—Extended opportunities for training of public service workers through courses organized for prison officers, waterworks employees, tax assessors, sewage disposal workers, highway construction men, park maintenance workers, and many other public-service employee groups.

*Occupational Information*—Collected and disseminated to professional workers in guidance and to laymen information on occupations and guidance. Helped to develop State programs in Massachusetts, Missouri, Vermont, and in Puerto Rico.

Encouraged co-operation between vocational and general services in State department activities in this field.

**Vocational Rehabilitation**—Continued rehabilitation service for persons who, becoming disabled by accident or disease, needed physical restoration or retraining in order to return to productive employment, and to physically handicapped young persons of employable age, who upon leaving high school or college would enter the occupational world under the handicap of a physical disability. Developed a uniform system of reporting on service. Surveyed rehabilitation work in California and Michigan. Assisted in organizing State programs in Kansas and Delaware. Surveyed many industries in program looking toward placement of more blind workers in jobs. Directed establishment of nearly 1000 vending stands with blind persons in charge in Federal and private buildings, located in 43 States, the District of Columbia, and Hawaii.

**CCC Camp Education**—Provided specific training programs for individual enrollees based on their interests, needs, and abilities. Prepared more than 40,000 enrollees sufficiently well to warrant their discharge from camp to accept employment. Gave academic instruction to more than 100,000 enrollees each month. Developed special educational programs for enrollees who had not completed elementary grades, using six workbooks in language usage and six in elementary arithmetic. Urged co-operation of schools and colleges adjacent to camps which offered instruction to nearly 8000 enrollees. Provided teaching staff of 1500 educational advisers to direct educational programs available to more than 6,000,000 enrollees. Granted eighth grade certificates to 5000; high school diplomas to 1000. Sponsored conferences to promote education for 26,000 war veterans in 136 camps for veterans.

**National Defense**—Urged schools and colleges throughout the United States to make their best possible contributions to aid in the national defense program. Presented to Federal Government agencies and officials information showing American education's facilities for defense training service. Began administration to State Boards for Vocational Education and educational institutions of Federal funds for defense training authorized by Congress and the President as follows: \$41,000,000 for pre-employment refresher and supplementary courses for defense jobs in industry; \$10,000,000 to train rural and non-rural youth; \$7,500,000 to train NYA workers in vocational schools; \$9,000,000 for short courses in engineering colleges and universities to meet shortage of engineers; \$8,000,000 for defense training equipment needed in vocational school shops. WPA, NYA, and U.S. Employment Service co-operated in supplying qualified persons to receive defense training in vocational schools and to help place those trained in essential defense occupations. Vocational schools trained 350,000 workers for defense jobs July 1 to Dec. 31, 1940. Adapted entire program of research and other services of the U.S. Office of Education to meet defense needs of government, industry, and education.

J. W. STUDEBAKER

## EGG PRODUCTION. See POULTRY.

**EGYPT.** A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1940, Farouk I, who succeeded to the throne Apr. 28, 1936.

**Area and Population.** Excluding the Anglo-

Egyptian Sudan (q.v.), Egypt has an area of about 386,000 square miles of which only about 13,600 square miles along the Nile are occupied. The estimated population on June 30, 1939, was 16,522,000, including about 65,000 Italians and 100,000 Greeks. Populations of the chief cities at the 1937 census were: Cairo, 1,307,422; Alexandria, 682,101; Port Said, 126,907; Tanta, 94,421; Mansura, 68,637; Asyut, 59,925; Damanhur, 61,791.

**Religion and Education.** Of the 1927 population, 91 per cent were Moslems, 8.34 per cent Christians (mostly Copts), and 0.45 per cent Jews. Arabic is the official language. About 88 per cent of the adult inhabitants were illiterate in 1927. The school attendance in 1937 was 1,308,252.

**Production.** Agriculture supports more than 60 per cent of the population directly. The yields of the chief crops in 1939-40 were (in metric tons): Wheat, 1,333,800; barley, 238,200; corn, 1,522,300; rough rice, 887,800; sugar cane, 159,800; groundnuts, 16,600; cotton, 390,500. Livestock statistics for 1937 showed 983,000 cattle, 956,000 buffaloes, 1,919,000 sheep, 1,311,000 goats, 155,000 camels, and 1,142,000 asses. Mineral production for 1939 was (metric tons): Phosphates, 547,000; petroleum, 666,000; manganese ore, 35,000. The fishing industry in 1938 employed 52,970 persons with 10,022 boats.

**Foreign Trade.** In 1939 imports were valued at £E34,091,000 (£E36,934,000 in 1938) and exports at £E34,081,000 (£E29,342,000 in 1938). Imports were chiefly from the United Kingdom (£E9,371,000), the United States (£E2,683,000), Germany (£E2,625,000), and Italy (£E2,059,000). Exports were destined chiefly for the United Kingdom (£E11,322,000), France (£E3,499,000), Japan (£E2,427,000), Germany (£E2,214,000). Chief imports were cotton textiles, fertilizer, coal, coke, briquets, and machinery. See TRADE, FOREIGN.

**Finance.** For the fiscal year ending Apr. 30, 1941, the budget estimates placed receipts at £E44,960,000 and expenditures at £E46,960,000. For 1939-40 the estimates called for receipts of £E40,595,000 and expenditures of £E42,125,000. The consolidated public debt on May 1, 1939, was £E87,762,740. The Egyptian pound exchanged at the average rate of \$4.5463 in 1939 and \$5.0130 in 1938.

**Transportation.** In April, 1938, there were 2763 miles of government-owned railway lines (excluding sidings) and 976 miles of private lines. Up to Jan. 1, 1940, the government spent a total of £E612,901 on railway construction under the terms of the Anglo-Egyptian Railway Treaty of 1936. Of this sum, £E556,301 was used in strengthening the existing railway line between Alexandria and Mersa Matruh, and £E36,873 on lines in the Suez Canal district. In the fiscal year ended Apr. 30, 1940, receipts of the Egyptian State Railways totaled £E5,468,332. Highways in 1940 extended 6838 miles; automobiles numbered 33,787. Cairo is an important aviation center with airlines radiating to South Africa, Europe, and Asia. A new civil airport in Alexandria was under construction in 1940. See SUEZ CANAL.

**Government.** The Constitution of Apr. 19, 1923, abrogated on Oct. 22, 1930, was restored on Dec. 12, 1935. It provided for a Parliament of two houses—a Senate with 147 members, two-fifths nominated by the Crown and three-fifths elected by universal male suffrage, half for five and half for 10 years, and a Chamber of Deputies with 264 members elected for five years. The elections of Mar. 31 and Apr. 2, 1938, for the Chamber of Dep-

uties showed the following results: Liberal Constitutional party, 93; Saadist, 89; Ittehad Esh Shaabi, 19; Wafd, 13; Watani, 3; Independents, 47. Premier at the beginning of 1940, Ali Maher Pasha, heading a coalition of Saadists and Independents. For 1940 developments, see *History*.

#### HISTORY

**Egypt and the War.** The danger that Egypt would become a major battlefield of the European War deepened throughout 1940 until the British defeat of the Italians at Sidi Barrani in December. The precautionary measures taken under the terms of the Anglo-Egyptian military alliance in 1939 (see *YEAR BOOK*, 1939, p. 217) were intensified in May, 1940, when Italy's entrance into the conflict seemed near. The Egyptian Government, in consultation with the British, authorized the evacuation of civilians from towns near the Libyan border. Air raid precautions were tested. A general blackout was instituted May 26. Scores of Axis spies and suspects were rounded up. Meanwhile Allied forces in Egypt were reinforced and the Egyptian army was ordered to emergency stations. On June 8, 6000 children and aged persons were evacuated from Alexandria in anticipation of Italian air raids.

Two days after Italy declared war on Britain, the Egyptian Government severed diplomatic relations with Italy (June 12), suspended all economic and financial relations with Italy and Italian nationals, and rounded up or sent home a few of the many Italians remaining in Egypt. The Egyptian Government, however, took no action beyond the technical requirements of the Anglo-Egyptian treaty (see *YEAR BOOK*, 1936, for terms). There was no declaration of war. Egyptian troops were ordered not to attack the Italians and some frontier detachments were withdrawn a few miles from the border. According to a statement of Premier Ali Maher Pasha to Parliament on June 20, this was done "in order not to involve the country in a state of war before the government and Parliament had an opportunity to decide what was in the best interests of the country." It was June 19 before the Italian Minister and his staff of 121 persons were persuaded to leave Cairo. Thousands of Italian residents were left unmolested.

The Italian invasion of Egypt from Libya in September and the bombing of Alexandria, Cairo, and other Egyptian cities produced no basic change in the Egyptian policy toward the war. However the state of siege was extended to all parts of the country, the government widened its emergency powers, and strikes and lockouts in defense industries were prohibited. The British forces in Egypt were granted the full use of Egyptian ports, airfields and defense bases, and the other military facilities specified in the military treaty, but the Egyptian Government continued to maintain that its position was that of a neutral.

**Internal Politics.** This anomalous situation was due partly to the general desire to avoid involvement in the war and partly to the internal political situation. After the collapse of France most Egyptians considered Britain's prospects as none too bright. They apparently felt that a victorious Axis would treat Egypt less harshly if it remained neutral than if it joined in the conflict. This belief was encouraged by Mussolini's statement that Italy would not drag Egypt and other Mediterranean countries into the conflict unless they adopted a hostile attitude.

At the same time the revolutionary Wafd party, which was much more powerful than its small representation in the Lower Chamber indicated, and many other Egyptian nationalists including the King desired the complete elimination of British influence. Enmity between the Wafd and the other parties that were more favorable to co-operation with Britain also influenced government policy. The attitude of the Wafd was indicated in a memorandum submitted to the British Ambassador on Apr. 2, 1940. The party expressed willingness to support the Allied cause provided British soldiers left Egypt immediately after the war, provided Britain promised to negotiate an immediate settlement of the Anglo-Egyptian Sudan question after the war, and provided Egypt was allowed to "defend her rights" at the peace conference. The Wafd also demanded that Britain make restitution for the loss of Egypt's cotton market through the British blockade and that Egypt be permitted to decide whether martial law should continue.

Premier Ali Maher Pasha had worked in close collaboration with the British before Italy entered the war, but thereafter his obvious anxiety to avoid involvement led the British to complain that the internal precautions of the Egyptian Government and its co-operation with the British military forces was not in accordance with the spirit of the Anglo-Egyptian treaty. With the support of the Saadist and some other Egyptian leaders, the British Ambassador intimated to the King that a stronger government was necessary to carry out defense and internal security measures.

On June 23 the King accepted the resignation of Ali Maher Pasha's government and on June 29 a new ministry was formed under Hassan Sabry Pasha, representing a coalition of all political parties except the Wafd. The new Premier's statement of foreign policy pledged loyal execution of the treaty, maintenance of Egyptian independence, and avoidance of war. This showed no outward change from Ali Maher Pasha's policy, but the British Foreign Secretary in mid-July said British relations with the new government were "completely satisfactory."

Hassan Sabry Pasha's Government found itself under attack from two sides. Led by Ahmed Maher Pasha, chief of the Saadist party and president of the Chamber of Deputies, an influential minority group demanded that the government declare war on Italy and actively enter the conflict. The Wafdist, on the other hand, attacked the government for co-operating with the British and for its failure to extract concessions from them. On August 21 the Premier reportedly told a secret session of the Chamber that Egypt would fight if Italian troops crossed the frontier. But this promise was not fulfilled when the Italian invasion began in mid-September. This led to the resignation of four Saadist Ministers from the cabinet on September 21. The government on September 23 declared full martial law and commenced a round-up of all Italians, but even the bombing of Cairo on October 21 did not budge the government from its "neutral" policy. (Between June 12 and December 2, 155 Egyptian civilians were killed and 425 injured by Italian air raids.)

While reading the King's speech from the throne to the opening session of Parliament on November 14, Premier Sabry Pasha collapsed and died. He was replaced the next day by another non-party Premier, Hussein Sirry Pasha, who retained a number of Sabry Pasha's Ministers. The new gov-

ernment continued to follow the middle-of-the-road policy of the preceding ministries, and this course was approved by the Chamber on December 26, 1922 to 68. Meanwhile the British victory at Sidi Barrani had removed the threat of an Italian conquest of Egypt and materially strengthened the position of Britain and its supporters in Egypt.

**Other Developments.** Egypt suffered severely from the economic effects of the war after Italy's entrance. Its foreign trade slumped drastically. Prices of manufactured and imported goods soared. There was little prospect of disposing of Egypt's cotton and other export crops, and more than 100,000 persons were thrown out of work. This situation was capitalized by the Wafd in pursuing its anti-British policy. Some alleviation of the economic depression occurred when the British Government in August undertook to purchase the entire 1940 cotton crop. Later the rising expenditures of the expanding British forces in Egypt (estimated at £20,000,000 annually) offset to a large degree the effects of curtailed foreign markets.

Egyptian nationalism was reflected in economic as well as political measures. On Mar. 28, 1940, the Senate authorized the government to guarantee present and future deposits of the Banque Misr, to strengthen its position and ensure its success.

The bank was an Egyptian-owned institution, responsible for the development of some 19 national industrial companies. The government also espoused a £10,000,000 project for erection of a powerful hydro-electric plant utilizing the overflow of the Assuan Dam. The power was to be used for the manufacture of artificial fertilizers and the industrialization of southern Egypt.

Conventions for the abolition of the Public Debt Commission were concluded with Great Britain on July 17 and with France on August 3. The commission, consisting of representatives of Britain, France, and Italy, had partially controlled Egyptian finances since 1876. Its funds were turned over to the Egyptian Government, which accepted responsibility for all its liabilities. A law of August 12 prolonged until 1980 the charter and note-issuing privilege of the National Bank of Egypt. The law provided that the chairman and a majority of the board of directors must be Egyptians.

eral Republic. He defeated Wendell L. Willkie, Republican candidate, in the popular vote, by a plurality of 4,911,621, carrying 38 States. Roosevelt won 449 electoral votes; Willkie, 82. The total of the popular vote for all the Presidential candidates, including a scattering vote of 413, was 49,818,995; highest previous, 45,647,117 in 1936.

The table on page 207 shows the totals of the popular vote for President in each State and the totals for the United States (reprinted by permission of the Associated Press).

Here are the comparative figures for 1940, 1936, and 1932:

Party	1940	1936	1932
Democratic	27,245,422	27,751,597	22,821,857
Republican	22,333,801	16,679,583	15,761,841
Socialist	116,796	188,014	884,781
Prohibition	58,674	37,661	81,869
Communist	49,028	80,159	102,991
Socialist Labor	14,861	12,508	33,276
Other votes . . . .	413	897,595	129,907
Total vote . . . .	49,818,995	45,647,117	39,816,522

The conditions environing the election itself, and the campaign before it, bore in some respects more resemblance to those of 1916 than to those of 1936; for war abroad lent activity to many important sorts of manufacturing, while it spread the apprehension of peril to the country. The Administration's policies continued to please, broadly speaking, those who lived by employment or by public support alone and to antagonize many who had a stake in productive business, property, or funds. Among the latter group, rather than the former, were a great part of the more substantial farmers, whose land formed an important aggregate investment. Conditions differed from those of 1916 as to the foreign situation, in that very few of the population wanted the country to enter the war in Europe. Also, they differed in that the Government had reached the statutory limit of \$45,000,000,000 upon its debt and was engaged in a vast increase of armament bound to send debt yet farther above the ceiling of all older figures. Issues uppermost in the minds of anti-Administration folk were the policy of making distinction between earners and owners, the treatment of agriculture, the continued vast increase of the public debt, and the question of the proper cost of a prudent addition to the Nation's means of defending itself against attack from without. Since earners cast more votes than owners and poor farmers than rich ones, since the size of the debt meant little to the many who looked to the few to bear it, and since the effort to limit military preparation must incur reproach as unpatriotic, the appeal of the issues, politically viewed, favored the Administration. The Republican cause carried the handicap of not daring to handle them as freely as the other side.

**Pre-Convention Activity.** Several aspirants to the Presidency, in each of the major parties, spent the months prior to the nominating conventions in efforts to win popular followings. On the Democratic side, two leading members of the Administration prepared to seek the nomination—Vice-President Garner of Texas and Postmaster-General Farley of New York—while a third Democrat, also connected with the Administration though less closely, former High Commissioner McNutt of the Philippines, took the same course. Among Republicans, exclusion from Federal office for nearly eight years had so far cut down the

number of experienced statesmen that candidacies were limited mainly to leading men among the small group of Republican Senators and to persons until then outsiders in the shaping of Federal affairs; Ex-President Hoover, though presented as a candidate and equipped with abundant experience, had no chance to overcome the antagonism due to the misfortunes that the country and the party had suffered in his administration. The most formidable seekers of the Republican nomination were two Senators—Vandenberg of Michigan and Taft of Ohio—and two newcomers in National politics—Wendell L. Willkie and Thomas E. Dewey. Dewey had won notice for remarkable success in prosecuting big criminals as District Attorney of New York County. Willkie had caught the eye of the New Deal's opponents by bringing the Administration to buy out at a substantial price the imperiled properties of the Commonwealth and Southern Corporation in the area where the TVA sought a monopoly of the distribution of electrical current.

Among the Democratic aspirants none developed sufficient strength to disturb the strong undercurrent toward the renomination of the President. Vice-President Garner, seemingly formidable because of his prospect of controlling the vote of Texas in the nominating convention, and as one in good repute with the friends of social and economic tradition, could get only the halfway assurance of the Texan delegation's initial support in the convention. Farley, who had performed wonders as Roosevelt's political manager, could do little on his own account, even in his own State of New York. These two and McNutt as well, could get no man's attention, while the President pointedly avoided, for month after month, saying that he would not take a third term.

This silence of Mr. Roosevelt on his political plans came to dominate the whole field of Democratic preliminary maneuver. Till he should take himself out, few cared or dared to back another. And so long as he forbore from counting himself in, he could not be seriously attacked for planning to overthrow the potent tradition of two terms and no more; he was not asking for Theodore Roosevelt's "third cup of coffee."

Among the seekers of the Republican nomination Dewey made the pace until May; speaking in a great number of States, he won hearers by his ability to present a plausible case against Democratic rule. In some States he won indorsements in the Republican Presidential primaries, to the disadvantage of other aspirants who sought to clothe themselves with more than a "favorite son's" single-State claim to consideration. He was less successful in winning the confidence of old-time partisan leaders powerful in their own areas. Willkie, meanwhile, had gradually built up a reputation as an energetic and forceful campaigner. He had done particularly well in New England and in the Middle West. Yet on the eve of the convention he seemed less formidable than Dewey, who claimed 400 of the convention's votes as pledged to him.

**Republican Convention.** The delegates of the Republican party held its National convention at Philadelphia in the week of June 24. It gave the party's nomination as candidate for President to Wendell L. Willkie. He won on the sixth ballot; the three leading names before the convention were Thomas E. Dewey, Robert A. Taft, and Willkie. Willkie's vote, originally 105, mounted with each succeeding ballot. Dewey's vote dwindled steadily

from 360 on the first ballot. Taft's vote, 129 on the first ballot, mounted with Willkie's through the fifth ballot, but less rapidly. Sen. Charles L. McNary of Oregon, popular with farmers as an early sponsor of agrarian legislation, was nominated for Vice-President.

**Republican Platform.** The Republican platform, as adopted by the convention, declared that the Administration, by the President's own admission, had "left the Nation unprepared to resist foreign attack"; it promised "to support all necessary and proper defensive measures proposed by the Administration"; it approved material aid to foreign nations fighting for liberty; it promised to put the Federal grants for support to the poor under the administration of the respective States; it favored raising old-age benefits, as far as the revenues for the purpose would permit; collective bargaining (for labor) was approved, but the revision of the National Labor Relations Act was proposed "in fairness to employers and all groups of employees"; agriculture was promised an expansion of industrial and business activity to increase the purchases of farm products, but in the interim it was to get continued aid for soil-conservation, involving continued Federal cash "benefits," without having to submit to Federal control of production; the reciprocal trade agreements were condemned as put through too hastily, without the approval of Congress, and the party promised to explore the possibilities of "genuine reciprocity"; Congress was to reclaim from the President its Constitutional power over money, repeal the Thomas "Inflation" Amendment and the authorization to purchase foreign silver, and "take all possible steps" to put gold back in circulation; the principle of "truth in securities" was approved, but in order to put dollars and men back to work the Securities Act was to be revised; taxes sufficient to meet civil expenditure, interest on debt, and part of the expenditure on defense were promised; a Constitutional amendment against a President's serving more than two terms was advocated.

**Democratic Convention.** The Democratic National Convention was held in the Chicago Stadium in the week of July 15. On the opening day President Roosevelt's persistent silence as to his intentions had not yet been broken; no one asserted any authoritative knowledge of what he would do, but among the delegates, as indicated in the press, the conviction prevailed that he would be nominated and would accept. Some of his most influential supporters were reported from the outset as pressing otherwise-minded delegates to join a movement to "draft" Roosevelt, as the only one to be trusted to handle National defense at a moment fraught with menace. Some among the delegates did indeed oppose breaking historic tradition that forbade a third term for a President and, in particular, repudiating the anti-third-term declaration of the party's platform of 1896; these men, too, had to be "drafted." On the 16th Senator Barkley, at the end of his speech as permanent chairman, made, as spokesman for the President, the latter's long-withheld declaration: The President had no desire or purpose to become again a candidate for the office; he wished the delegates to feel "free to vote for any candidate." As the word "any" included himself, the declaration was hailed as implying that he would run if named. Objectors were deprived of the argument that even the President hesitated to overthrow the third-term tradition.

Franklin D. Roosevelt was chosen Democratic

candidate for President on July 18 on the first ballot. The Convention gave him an overwhelming vote amid a tumult of shouting and marching. The minority put three other names in nomination, by way of protest against a third term rather than with any hope of success. Glass, aged Senator from Virginia, nominated Farley; the two others nominated were Garner of Texas and Senator Tydings of Maryland. The President delayed an expected address to the Convention by radio until after its choice of Secretary of Agriculture Henry A. Wallace, the President's reported preference, as candidate for Vice-President, on the 19th.

**Democratic Platform.** The Democratic platform, as adopted by the Convention on July 17, was largely a rejoinder to the Republican platform issued in June. It paralleled the Republican pledge against foreign wars, approval of aid to foreign nations defending their liberty, purpose to defend the Monroe Doctrine, and recognition of the need to improve armaments. It praised the President's foresight in having brought defenses to "the peak of their peace-time effectiveness," (as against admitted unpreparedness, in the Republican version). Farmers received assurance of continued parity as well as soil-conservation payments (Republicans promised only the latter), of more money for tenants' purchase of farms, for refinancing farm mortgages, for continued commodity loans, for free lunches in schools, and for cheap sales of milk so as to market more of farmers' goods. Without praising the much criticized NLRB by name the platform promised to "continue to enforce fair labor standards" and maintain the principles of the Labor Act. The Republicans' nomination of "a utility executive" for the Presidency was declared to raise the issue whether "the Nation's water power" should be for the selfish interests of the few. Falling water's power, said the platform, was "a gift from God," consequently belonging "to all the people"; a public monopoly of water-power and electricity therefrom was approved—"the people have the right, through their Government, to develop their own power sites and bring low-cost electricity to their homes, farms, and factories." The Republican proposal to vest in the States the control of Federally financed work-relief was called "a thinly disguised plan to put the unemployed back on the dole." The platform promised "to destroy the treasonable activities of disguised anti-democratic and un-American agencies" but did not specify the sorts of agencies so to be regarded.

**Presidential Campaign.** The true campaign started only with Willkie's speech of acceptance on August 17. In the meantime, Farley, an avowed anti-third-term, resigned as Postmaster-General and also as chairman of the Democratic National Committee; there followed a rebuilding of the Democratic National organization. Edward J. Flynn, leader of the Democratic organization in the Bronx Borough of New York City, became Farley's successor in the National Democratic organization—a step carrying recognition that help from the party's other leaders in big cities would suit the National ticket. Flynn ignored protests and issued the Democratic campaign book, carrying 100 pages of advertising, some at least of which had been obtained from interests that might find it difficult to refuse a solicitation. This advertising was said to have been arranged before the passage of the year's amendments to the Hatch Act and therefore not to infringe the new restrictions on politi-

cal activity. In regard to another newly outlawed way of raising campaign funds, the levy on holders of public employment, Flynn sent out to State campaign managers in October a letter advising that "even where the . . . Government or State employees cannot . . . make contributions . . . their friends and relatives are in no way prohibited from such activities." One of the features of the Democratic campaign organization was the energetic co-operation of some of the most prominent leaders of municipal organizations within the party—the Tammany group in New York City, Hague in Jersey City, and the Kelly-Nash group in Chicago.

At Elwood, Ind., the home of his youth, Willkie (August 17) made the speech of acceptance, his first full-length utterance as his party's candidate, —a quiet but earnest presentation of his ideas on the Nation's needs in contrast with the ideas of the New Deal. He called himself a liberal, a believer in the regulation of enterprise and declared for curbing monopolies, for labor's right of collective bargaining, for minimum limits to wages and a maximum to working hours, supported the Federal regulation of interstate utilities and markets for securities, and approved social security and aid to underpaid farmers. He taxed the New Deal, not with achieving these things, but with overexpenditure, attacks on those whom it disliked, and a program of helping the needy by taking from others rather than by building up a further material progress. He warned that, as in the case of France, a scheme of national life built on not more, but less, production and taking from one for another's need must lead "to the end of the road." It was a winning rather than a convincing speech, for it did not demonstrate how policies could be changed to overcome the normal excess of the country's huge productivity. It left the way open to Secretary Ickes' jibe in a speech of rejoinder a few days later: "He agreed with Mr. Roosevelt's entire program of social reform and that it was leading to disaster."

Obliged to make himself better known throughout the country, Willkie covered many thousands of miles on speaking tours. He began with a trip through the West in the latter part of September, which took in 18 States on a route of 38,000 miles; 14 of the States were west of the Mississippi River; four of the seven main speeches of the trip were delivered on the Pacific coast, in a fruitless effort to wean that area from the Democratic party. In October Willkie devoted his attention chiefly to the northeastern and east-central States, though he went as far west as Minnesota; he spoke in all the chief cities of the Atlantic seaboard. Much of the time he was in bitterly hostile territory; this was most evident in Detroit where his party was repeatedly pelted with a variety of missiles in the streets. He showed himself not only tireless but fertile in indictment, as when he cited past unkept promises as warning to mistrust the Administration's pledge not to send Americans into a foreign war. The very variety of his attacks was in a way their weakness; they lacked the force of concentration on the more vital matters; thus, at Springfield, Ill. (October 18), he charged the New Deal with leading to State socialism, yet he failed to drive this charge home by sufficient reiteration and to present any detailed condemnation of that system.

President Roosevelt withheld his own main participation in the campaign until a fortnight before

the election. He had previously made several "tours of inspection"; thus (October 10) he started on a tour, ostensibly to inspect defensive preparations in Pennsylvania and Ohio and actually affording occasion for a public address at Dayton (October 12) displaying him as the author and adept of the Nation's new recourse to giant defensive measures. Starting a real tour at Philadelphia on October 23, he made six campaigning speeches, the other five at New York (28th), Boston (30th), Brooklyn (November 1), Cleveland, and his hometown of Hyde Park. In these he bitterly attacked what he termed the falsifications in the Republican charges against his administration; reviewed its achievements and in particular, its course in upbuilding armament; and, in the character of a trusted leader in a difficult time, asked for a "vote of confidence."

**Minor Parties and Movements.** The minor parties played no more than their usual part in the campaign. An effort of John L. Lewis, creator of the C.I.O., to swing its votes from Roosevelt to Willkie had no perceptible effect. A group styling itself the "Democrats for Willkie" had men of distinction among its leaders but lacked any important organized following. The solid South, despite evidences of anti-Roosevelt sentiment in a number of States, gave no sign of serious switching toward Republicanism. The Socialist party nominated Norman Thomas again (the fourth time) for President, on a platform carrying his isolationist views and a demand for immediate public industry. (See SOCIALISM.) The Communists nominated Earl R. Browder. Roger W. Babson was nominated by the Prohibition party. The Socialist Labor party nominated John W. Aiken and called for the conversion of the Nation's resources to the interest of the whole people and the abolition of capitalism.

**The Vote.** While about 10 per cent more of the popular vote went to Roosevelt than to Willkie, the victor scored a personal rather than a partisan victory, as appeared from several States' electing Republicans to important office while giving him substantial pluralities. The preference for Roosevelt among the wage-earners appeared in the fact that every city of 400,000 people or more, except Cincinnati, voted heavily in his favor and that several such cities overcame, singlehanded, the Willkie vote in the remainder of their respective States. Eight of the ten States for Willkie had far less than the average proportion of urban population; Indiana had somewhat less, and Michigan, the tenth, alone had considerably more. Except for the solid South, the vote of 1940 displayed much more plainly than that of 1936 the gain of urban over rural ways of thinking.

The popular vote as a whole (49,818,995, as against 45,647,117 cast in 1936) exceeded that of 1936 by well above 4,000,000. The vote for Roosevelt, however, fell short of that in 1936 by about 510,000, while that for Willkie exceeded the Republican Presidential vote of 1936 by more than 5,600,000.

**Elections to Congress.** The terms of 60 Senators—44 Democrats, 15 Republicans, and 1 Independent—held over. In the autumn's elections 36 Senators were elected: of these, 22 were Democrats, 13 were Republicans, and 1 was a Progressive. Thus the membership of the Senate of the 77th Congress became 66 Democrats, 28 Republicans, 1 Progressive, and 1 Independent. Prior to the election the Senate of the 76th Congress held 69 Democrats, 24 Republicans, and 1 each of the

Farmer-Labor, Progressive, and Independent designations. The number of anti-Administration Democrats, a floating quantity, defied estimate as usual. In the newly elected House of Representatives the election raised the Democrats' number to 270 from 260 in the old House, lowered the Republican strength to 160, from the former 167, and gave the remaining seats to 3 Progressives, 1 American Laborite, and 1 Independent.

See NEW JERSEY; NEWSPAPERS AND MAGAZINES; SOCIALISM; UNITED STATES under *Administration and Investigations*. For results by States, see the States.

**ELECTRICAL ILLUMINATION.** The year 1940 was more significant for the further development and application of existing items than for new discoveries. Fluorescent lighting continues to be the outstanding illumination development. (See 1938, 1939 YEAR BOOKS) During the year the range in sizes of these lamps was extended, downward to a 6-watt lamp 9 inches long and upward to a 100-watt 60-inch size having an output of 4400 lumens. Notable is the improvement in fixtures to accommodate and enable effective use of fluorescent lamps. A new "soft white" color has been developed, especially for use where meats or other foods are displayed or served, or where a color of light complimentary to a person's appearance is required.

Germicidal lamps found many new applications. In addition to the 3-, 5-, and 15-watt sizes mentioned in the 1939 YEAR BOOK, a 30-watt lamp now is available which is identical to the 36-inch standard fluorescent lamp except for the omission of the luminescent phosphor and the use of a special glass which allows the bacteria-killing ultra-violet radiation to pass through. A New York hotel used eight of these latter lamps in each of 40 portable units to be used for the sterilization of guest bathrooms between occupancies. Other applications of the germicidal lamps include large walk-in refrigerators for meats, and in the manufacture of mattresses to reduce the number of bacteria in the cotton filling.

"Black light" is another form of ultra-violet radiation that is finding increased application. During 1940 many advances were made in both techniques and materials for the utilization of such radiation to activate fluorescent chemicals for utilitarian and decorative purposes. Carpets having patterns of fluorescent dyes show promise of effective use in theaters, the materials activated by "black lights" appropriately concealed. Murals painted with fluorescent paints are planned for several theaters. Demonstrations have indicated that the hazards of "blackouts" incidental to modern warfare may be greatly reduced in industrial plants and other places through the use of "black lights" in connection with fluorescent paints or other materials on objects and along passageways, stairways, etc.

Industrial heating has found a new tool for economically expediting various drying, baking, evaporating, and material-treating processes. It is a new incandescent-filament lamp, previously introduced, designed to produce less than 5 per cent of visible light, most of the remainder of its energy output being in the form of infra-red radiation of the type that makes the sun so effective a drying agent. The range of available sizes of these lamps has been extended to include 250-, 500-, and 1000-watt sizes.

Many of the benefits of the new sealed-beam

automobile headlamps used on most 1940 cars were made available to the users of older cars through the commercial development of replacement and auxiliary sealed-beam units.

The trend continues toward better street and highway lighting in the interest of safety. Notable highway installations of 1940 include a complete system of 10,000-lumen sodium luminaires along the entire 35-mile length of New York City's new Belt Parkway; similar units on the 1¼-mile floating pontoon highway bridge across Lake Washington near Seattle, Wash., and similar luminaires for all tunnel approaches and important interchange points along the 160-mile high-speed "superhighway" between Pittsburgh and Harrisburg, Pa. Throughout the total of nearly 7 miles of tunnels on that highway more than 1000 mercury-vapor lamps provide a longitudinal visibility of more than 1000 ft. through the medium of their characteristic blue-green light.

Forbes Field, Pittsburgh, became the latest and assertedly the most brilliantly lighted baseball park, utilizing 864 floodlights to produce some 210,000,000 candle-power. A new lightmeter utilizes a built-in filter to give the instrument a sensitivity closely matching that of the human eye, thereby obviating the use of correction factors when measuring the illumination produced by fluorescent lamps, mercury lamps, or other illumination sources of the electric-discharge type.

The sale of incandescent lamps in 1940 crossed the billion mark for the first time, with estimated sales of 590,000,000 large lamps and 510,000,000 miniature lamps. In June the prices of nearly 100 popular types and sizes of Mazda lamps were reduced, the twentieth such major reduction in 19 years.

G. ROSS HENNINGER.

**ELECTRICAL INDUSTRIES.** Production in the electrical manufacturing industry as tentatively reported for 1940 amounted to \$2,683,000,000 as compared with \$2,143,000,000 for 1939, and \$1,600,000,000 for 1938. The year was slightly below the 1929 peak, but 1941 seems destined to establish new records. First-quarter losses were about offset by second-quarter gains in total orders booked by leading manufacturers, but third-quarter bookings set new industry records, even above the boom year of 1929, and the strong upward trend continued through to the year-end. The overall index of sales of electrical goods for the year increased by about 25 per cent over 1939, twice the rate for general business for the same period. Considering production for 1925 as an index of 100, the Federal Reserve Board's indexes for general production in the United States were reported as follows: 134 for 1940, 119 for 1939, 97 for 1938, 124 for 1937, 113 for 1936, 121 for 1929. (These figures represent the FRB's 1940 revision for the entire series, and hence will differ somewhat from figures quoted in previous years.) On the same basis (1925 = 100), other electrical industry estimated indexes for 1940 as compared with finals for 1939 are respectively as follows: manufacturing, total production, 154 and 123; employment, 104 and 84 (U.S. population, 115 and 114); small appliances, 148 and 128; electric refrigerators, 1331 and 1100; industrial apparatus, 177 and 127; power transmission and distribution equipment, 123 and 104; insulated wire and cable, 82 and 71; miscellaneous supplies, 142 and 116.

By the close of 1940 the aluminum industry had

become the first to develop a major and concentrated demand for electric power incidental to the expanding National Defense program. Indications are that by mid-1942 at least a million h.p. in electric generating capacity will be required for the production of this vital metal. Expansion of plant facilities in the Pacific Northwest is expected to utilize 100,000 kilowatts of power from the Bonneville-Grand Coulee power pool. In addition to an allocation of approximately 100,000 kw of TVA power to aluminum production, the Aluminum Company itself has filed with the Federal Power Commission a declaration of intent to construct a 300,000-h.p. hydroelectric project on the Little Tennessee River near Montana, Tenn.

In spite of adverse recommendations from technical experts, the Defense Commission late in the year agreed to approve a contract for the production of ammonium nitrate at Muscle Shoals, involving TVA construction of a synthetic ammonia plant of 150 tons daily capacity and modernization of the old World War works, etc., at a cost to the Army of some \$10,000,000.

**Industrial Developments. Welding.** The steady trend of increasing use of electric arc-welding in industry was accelerated during the latter part of 1940 incidental to industry's efforts to meet Defense requirements. Perhaps the most significant trend was a striking increase in alternating-current arc-welders, especially in shops where heavy work is being done and where welds can be made on planes horizontal or nearly so. New arc-welding equipment developed during the year includes—built-in power-factor correction devices to reduce the burden on electric supply lines; a new resistor-type d.c. arc-welder for mine service; new d.c. equipment designed to provide any welding current from 25 to 250 amperes. The so-called energy-storage method of resistance welding utilizing electronic rectifier tubes and control apparatus was applied extensively by aircraft and other manufacturers utilizing spot-welding for aluminum and other thin metal sheets. Multiple-operated d.c. welding systems consisting of constant-potential motor-generator sets serving groups of individually controlled welding circuits found application in many phases of shipbuilding operations.

**Air Cleaning.** That clean air is as beneficial to machines as it is to human beings is indicated by the rapid spread of the relatively new "precipitron" type of electrostatic air-cleaning equipment which has demonstrated its ability to remove from the air such finely divided particles as those which comprise the smoke from a cigarette. Steel mills have become one of the largest users of such apparatus, having made installations totaling approximately  $1\frac{1}{2}$  billion cu. ft. per minute in air-handling capacity in steel plants to clean the cooling air for big mill motors and other electrical machinery, for ventilating mill office buildings, etc. By keeping industrial dirt out of the motors, etc., frequent and expensive cleanings and repairs have been sharply reduced. The ability of this equipment to remove pollen and bacteria from the air is bringing about increased hospital applications. The sugar industry is using the apparatus to reduce undesirable bacteria and fungus growths by cleaning the warm air used in granulating and drying machines.

**X-Ray.** A new X-ray development has enabled high-speed (millionth-of-a-second) pictures to be taken of such things as a bullet while passing through a block of wood; the bones in the kicker's foot and the insides of a football while being

kicked; etc. It is expected that this new device will perform valuable industrial service by enabling the "insides" of certain apparatus to be studied for stresses and strains while in full operation. It may be the forerunner of X-ray motion pictures. A new million-volt industrial X-ray equipment is capable of making a photograph through 4 inches of cast steel in 2 minutes. Notable for its compactness, this unit is only 3 ft. in diameter and about 5 ft. high and weighs 1500 lb. In contrast with this is the laboratory-type 1.4-million-volt X-ray apparatus installed recently at the U.S. Bureau of Standards that comprises a 10-section 12-inch glass envelope about 20 ft. high and a generator consisting of a cascaded series of 10 full-wave rectifiers arranged in a column 30 ft. high. The equipment will be used for research and standardization work in X-rays and X-ray technique. Medical X-ray equipments were improved, and greatly simplified in their operation by the introduction of precalibrated controls to replace time-consuming manual and mental operations heretofore required. Offsetting the loss of European supply, U.S. manufacturers brought out a new X-ray diffraction tube and related equipment.

**Electric Drive.** The continuing application of electric drive and control equipment in the paper industry is typified by one 1940 mill improvement whereby the operating speed of a 210-inch Kraft machine was increased from its original designed speed of 1250 ft. per min. to 1540 ft. per min., a new record for such a machine. The year also has witnessed a trend toward individual electric sectional drive for auxiliary processing—coating, combining, calendering, forming, etc.—machines in the pulp and paper industry. These drives require a minimum of floor space and reduce maintenance expense and accident hazard through the elimination of open lineshafts, open belts and gearing, etc. Flexibility of new electric control and drive equipment is exemplified in a supercalendering machine designed to run at 50 ft. per min. for threading and at from 1500 to 2000 ft. per min. for production.

In the petroleum industry, oil sands discovered at ever-deeper levels require heavier mechanical equipment and correspondingly larger capacities in driving motors and in electric supply equipment. During the year the capacity of motors used for drawing drill bits from deep wells has doubled—jumping from 400 to 800 h.p., with 1000-h.p. motors under consideration—in the interest of improving drilling efficiency by reducing the time required for the withdrawal and replacement of drill bits in holes ranging up to 2 miles or more in depth. For wells intermittently pumped—whether because of low capacity or proration schedules—there is a definite trend toward automatic pumping by time-switch control, the flexibility of which enables pre-selection of any desired sequence of operating cycles. Electric drive and precision control equipment is finding ever-widening use in refineries. Cathodic protection of pipe lines against electrolytic damage from earth currents has become extensive, and small weatherproof rectifier units have been developed to furnish from local alternating-current supply lines the direct currents at low voltage required to energize the pipe lines to neutralize the effects of earth currents.

In textile mills a deviation from all-electric drive for cloth-finishing ranges consists of a steam turbine-generator unit directly coupled mechanically to the lead unit of the range, with follower

units coupled electrically by squirrel-cage induction motors fed from the generator. This arrangement has been found to provide fully synchronized operation of all related units throughout acceleration, running, and deceleration periods. A stroboscopic device synchronized to a cloth-printing machine enables the printed design to be inspected as if stationary while actually the cloth is moving 200 ft. or more per minute.

**Steel Industry.** In the steel industry the decade of electrification and modernization reported in previous YEAR BOOKS is now standing the industry in good stead, faced as it is with peak production requirements under the National Defense program. A new record in total production was set in 1940. The heavy demands for high-quality alloy and carbon steels for aviation, automotive, machine-tool, armor, and ordnance needs has resulted in the installation of many new electric arc furnaces, several of very large capacity. One electrical manufacturer alone has furnished some 150,000 kv-a in transformer capacity for 20 such installations ranging from 800 to 15,000 kv-a. Continuing the upward trend of operating speed in cold-strip rolling mills (see 1939 YEAR BOOK), 1940 saw a 2500-ft.-per-min. mill put into operation (2000 ft per min. was tops in 1939) and a 3800-ft.-per-min mill ordered. The five rolling stands of this mill are scheduled to be driven respectively by 800-, 2000-, 2500-, 2500-, and 3000-h p motors—a total of 10,800 h.p. Devices for detecting pinholes and flaws, and other devices for automatically measuring and indicating thickness, width, and tension in this fast-moving strip, found increased application during 1940.

**Aviation.** Aircraft instruments or controls developed or improved during the year include devices to facilitate the accurate synchronization of the several engines of a multi-engine ship to reduce vibration and equalize tractive efforts; devices to indicate the number of rounds of ammunition remaining in the magazines of aircraft machine guns; devices for feathering the propeller when it becomes necessary to stop an engine in flight; devices for producing and utilizing special radio signals to guide planes down out of "thick" weather onto airport runways; motor-operated gun turrets on military craft; etc. A new 60-inch high-intensity carbon-arc mobile antiaircraft military searchlight constitutes a complete unit with its associated portable power plant and remote electrical control station. Special high-speed electric motors of exceptionally small sizes have been built for use by airplane manufacturers in testing model aircraft. One such unit is a water-cooled motor only 10 inches in diameter and 30 inches long, but capable of delivering 200 h.p. at 5000 r.p.m.; another only 28 inches in diameter and 35 inches long delivers 1000 h.p. at 2100 r.p.m.

One large electrical manufacturer announced during the year the complete re-styling of a wide line of motors for industrial applications. The significant move was reported to involve new design methods, new materials which make for compactness, and new manufacturing methods including standard usage of cast-iron frames and endbells which give protective enclosure. See HEATING and VENTILATION.

G. ROSS HENNINGER

**ELECTRICAL MACHINERY.** See ELFC-TRICAL INDUSTRIES; ELECTRIC LIGHT AND POWER; MACHINE DEVELOPMENT; POWER PLANTS, etc.

**ELECTRICAL TRANSPORTATION.** See RAILWAYS.

**ELECTRIC LIGHT AND POWER.** National Defense activities were reflected in an increased demand for electric energy throughout the United States in 1940. Industrial power requirements were up by 16 per cent, commercial by 7 per cent, and residential by 10 per cent as compared with 1939. Available capacities on electric utility systems enabled these sudden increases to be met without difficulty, and the industry's prompt advancement of schedules for increasing capacity assure ample supply of electric power for even the record demands that appear to be immediately ahead.

**Power Production.** Production of electric energy in the United States increased by nearly 12 per cent during 1940 as compared with 1939. Increases were general in all parts of the country. Statistical data are given in Table 1.

TABLE 1 ELECTRIC POWER GENERATION—1940  
(Billions of Kilowatt-hours)

Year	From Fuel	From Hydro	From Canada	Gross Total	Uses & Losses	Available for Consumers' Use
1940	97.3	47.3	1.0	145.6	27.1	118.5
1939	86.3	44.0	1.2	131.5	25.8	105.8
1938	71.8	44.8	1.1	117.7	24.1	93.7
1932	49.1	33.3	0.4	82.8	19.1	63.7
1929	62.7	33.2	1.0	96.9	21.6	75.3

**Financial.** A new record for gross revenue from the sale of electric energy was established in 1940—\$2,413,234,000. Although the usage of electric energy increased by some 12 per cent in 1940, corresponding gross revenue increase amounted to only a little more than 5 per cent, reflecting increased sales of large blocks of low-rate industrial power and the effects of still further rate reductions. Taxes against private utilities for the year amounted to some \$405,000,000—up nearly double any other yearly increase, and more than 17 per cent above the 1939 tax bill—representing 18 cents out of every dollar of gross revenue. During the year the average urban residential consumer increased his usage from 890 kilowatt-hour to 950 kw-hr for the year while his rate went down from 4.05¢ to 3.81¢ per kw-hr as compared with 1939. In ten years the residential usage of electric energy has increased from an average of 540 kw-hr and the average rate has decreased from 6.0¢. Selected statistical data concerning customers, sales, and revenues are given in Table 2.

TABLE 2 ELECTRIC POWER SALES—1940

	Urban Residential	Rural	Commercial Industrial
New customers	885,000	52,000	49,000
Total customers	24,850,000	686,000	4,555,000
Per cent of gross total	82.6%	2.3%	15.1%
Power use in per cent of gross power sales	19.1%	1.7%	79.2%
Gross revenue from 1940 power sales	\$885,900,000	\$49,674,000	\$1,477,660,000
Per cent of gross revenue	36.8%	2.1%	61.1%

The volume of electric utility financing during the year amounted to about \$989,460,000, representing some \$92,000,000 in new capital and the remainder refundings. Capital expenditures for extensions and improvements to electric power systems as reported for 1940 are as follows: for fuel power plants, \$200,430,000; for hydroelectric pow-

# ELECTRIC LIGHT AND POWER 214 ELECTRIC LIGHT AND POWER

er plants, \$9,270,000; for transmission facilities, \$55,900,000; for substation facilities, \$57,760,000; for distribution facilities, \$237,700,000; for miscellaneous items, \$35,520,000; total, \$596,580,000.

**Generation.** New capacity in electric generating plants as reported for 1940 amounted to 1,851,900 kilowatts; a 50 per cent greater increase than for 1939, but less than half the 3,900,000 kw in new capacity scheduled for 1941 to meet National Defense and normal needs. Statistical data are given in Table 3.

crease is nearly 40 per cent greater than for 1939, but less than already is scheduled for 1941. All of which reflects the preparations of the electric light and power industry to meet Defense requirements for electric energy.

Developments in equipment include improvements to trailer-mounted mobile substation units for emergency service; extension of the "wound-core" method of manufacturing distribution transformers upward to 500-kilovolt-ampere sizes; improvements to and more extended use in industrial

TABLE 3: ADDITIONS TO ELECTRIC GENERATING CAPACITY—1940

Year	Fuel Plants Public		Fuel Plants Private		Total		Hydroelectric Plants Public		Hydroelectric Plants Private		Total		Totals	
	No.	Kilowatts	No.	Kilowatts	No.	Kilowatts	No.	Kilowatts	No.	Kilowatts	No.	Kilowatts	No.	Kilowatts
1940	39	243,400	57	1,210,500	96	1,453,900	8	263,200	9	134,800	17	398,000	113	1,851,900
1939	21	119,750	48	794,930	69	914,680	4	86,450	12	283,700	16	370,150	85	1,284,830
1938		1,350,200				1,350,300						345,600		1,695,600
1934						52,800						41,900		94,700
1929						2,081,300						249,200		2,329,500

The geographic distribution of electric generating capacity in public utility plants as of the close of 1940 was about as shown in Table 4.

TABLE 4: DISTRIBUTION OF PUBLIC UTILITY POWER PLANTS—1940

Area	Number of Plants	Aggregate Capacity (Kilowatts)
6 New England States	332	3,061,000
3 Middle Atlantic States	397	9,678,000
5 East North-Central States	660	9,320,000
7 West North-Central States	819	3,264,000
8 South Atlantic States	410	5,076,000
4 East South-Central States	196	2,149,000
4 West South-Central States	428	2,103,000
8 Mountain States	367	2,186,000
3 Pacific Coast States	301	4,163,000
Totals	3,910	41,000,000

Because of relative economics, and in spite of extensive and costly government development of hydroelectric projects, the growth in both generating capacity and power production continues to be preponderantly in fuel plants. Improved equipment and better load factor brought the fuel rate down to 1.36 lb. of coal per kw-hr, 2½ per cent less than for 1939 and 20 per cent less than in 1929. Fuel—gas, oil, coal—consumed in the generation of electric power in 1940 amounted to the equivalent of more than 65 million tons of coal. (See POWER PLANTS.)

**Transmission and Distribution.** More than 7000 miles of transmission lines (11,000 volts or above) were reported as constructed during 1940, heaviest in the 5 East North-Central, 9 South Atlantic, and 3 Pacific States, which among them accounted for some 3800 miles. Tentatively scheduled for 1941 are 6000 more miles. The average United States total for 1937–39 was slightly more than 5000 miles per year. As the year closed, the sixth major transmission line was under construction incidental to the Hoover (Boulder) Dam project—this the second 220,000-volt line of the Southern California Edison Company, Ltd. Other lines now in service are three 287,000-volt lines of the Los Angeles Bureau of Power & Light and a 138,000-volt line of the Nevada-California Electric Corporation.

New substation capacity reported totalled 3,800,000 kw, nearly a third of which was concentrated in the 5 East North-Central States. The year's in-

plants of metal-clad "load-center units" consisting of transformer and all related switching and control equipment; extensions in application of oilless and "oil-poor" designs of circuit breakers; improvements in metering and automatic control equipment. Among air-blast circuit breakers produced were a 23,000-volt indoor unit and a 138,000-volt outdoor unit, each designed to have an interrupting capacity of 1,500,000 kv-a.

**Rural Electrification.** As of midyear, the Rural Electrification Administration reported that some 630 systems had been completed and placed in operation, serving 568,000 customers over 233,000 miles of lines. This represents a total expenditure of public funds amounting to about \$221,000,000, including the 1940 allotment of about \$99,000,000. REA now reports 32 generating plants aggregating about 26,000 kw in capacity which generated about 35,000,000 of the 440,000,000 kw-hr distributed over REA lines in 1940.

**Government.** The outcome of the national elections in November, 1940, was expected to reinforce the determination of the Securities and Exchange Commission to apply literally the full provisions of Section 11 of the Public Utility Holding Company Act—the "utility death-sentence." Although officially spoken of in terms of "integration" of utility systems, the Act apparently actually aims at disintegration of holding-company systems into small segregated and purely local operating units, any one of which the parent company may elect to retain subject to approval of SEC. Early in the year SEC ordered several of the largest utility systems to submit answers to a group of questions and allegations, but avoided giving any orders that could be used as bases for court tests of the Act as currently interpreted by SEC. Various preliminary hearings were held and SEC made various "suggestions," but no conclusive action had been taken at the year's end.

A startling and far-reaching decision of the U.S. Supreme Court in the 15-year-old case of the Appalachian Power Company vs the Federal Power Commission swept aside all precedents, as well as the protests of more than 40 States, in ruling that the Federal Government has full jurisdiction over all streams and their tributaries regardless of actual navigability. Against the States' contentions that Federal control is limited to "navigable waterways," the Court decided, 6 to 2, that the Federal

authority "is as broad as the needs of commerce."

**ENGINEERS, Corps of.** The Corps of Engineers, U.S. Army, under the direction of the Secretary of War and supervision of the Chief of Engineers is charged so far as concerns its civil functions, with investigation and construction of works for improvement of rivers, harbors, and other waterways for navigation and flood control. Many of the projects involve features designed for power development, irrigation, pollution abatement, or water conservation. During 1940 approximately 1000 river and harbor projects were in force and active work was prosecuted on 385. Active work was also under way on 159 of some 380 general flood control projects, in addition to authorized flood protection work for the alluvial valley of the Mississippi River, and for the Sacramento River and tributaries. An Act of Congress approved June 24, 1940, appropriated \$67,365,310 for the prosecution of river and harbor works, \$70,000,000 for general flood control projects, \$30,800,000 for Mississippi River flood control work, and \$1,242,000 for Sacramento River flood control work. This Act also appropriated \$2,000,000 for continuing the construction of the hydroelectric power plant at Fort Peck Dam, Montana, and \$3,400,000 for similar work at Bonneville Dam, Oregon. Also, in the First Supplemental Civil Functions Appropriation Act of Oct. 9, 1940, the further sums of \$8,127,000 for river and harbor works and \$4,000,000 for power plant purposes at Bonneville Dam were made available.

During 1940 major river and harbor projects under way included: Rock removal and dredging in New York and New Jersey Channels to secure increased depth of at least 35 feet in this intensively used waterway which extends through Lower New York Bay, Raritan Bay, Arthur Kill, and Kill Van Kull to deep water in Upper New York Bay; deepening of the Delaware River Channel from Philadelphia to the sea to 40 feet; improvement of the Chesapeake and Delaware Canal in

Delaware and Maryland by dredging, construction of mooring facilities, bank protection, and a new high level highway bridge at St. Georges; deepening of the Great Lakes-Hudson River waterway to 14 feet and alteration of bridges to provide 20-foot headroom; widening and deepening of Cape Cod Canal; deepening of the Atlantic Intracoastal Waterway from Winyah Bay, S.C., to St. Johns River, Florida, to provide a 12-foot channel; and dredging of the Gulf Intracoastal Waterway southwest of Freeport, Tex., a channel of not less than 9-foot depth now being available generally from Freeport, Tex., to Carrabelle, Fla.

The Tuscaloosa Lock and Dam on the Warrior River, Alabama, was completed, replacing old locks and dams Nos. 10, 11, and 12, which were removed. On the Upper Mississippi River to Minneapolis the last of the authorized 26 locks and dams—No. 24 at Clarksville, Mo.—was opened to navigation. Enlargement of the harbors at Fairport and Ashtabula, O., was effected and work was advanced at Sturgeon Bay and Lake Michigan Ship Canal, Wisconsin, Keewawee Waterway, Michigan, Erie Harbor, Pennsylvania, and Buffalo Harbor, New York. Fort Peck Dam, Montana, and Bonneville Dam, Oregon, have been completed except for installation or extension of power plant facilities now under way. An 18-foot channel with protecting entrance jetties was completed at Yaquina Bay and Harbor, Oregon. Dredging was continued to provide project depths of 35 and 26 feet in Area M, San Diego Harbor, California, and in San Joaquin River to provide the 30-foot widened channel to Stockton. One of four concrete arch debris dams was finished in the Sacramento River Basin and another is well advanced. For the 27-foot channel project, Vancouver to Bonneville, on the Columbia River, 32 dikes were completed and dredging was carried out.

Flood control activities included completion of the Arkport Dam, New York, the Crooked Creek and Tionesta Dams in Pennsylvania, and local protection projects at 37 localities in various river basins throughout the United States. The latter projects ranged in scope from the extensive levee and flood wall systems constructed for protection of the Cities of Ceredo and Kenova and the business section of Huntington, W.Va., in the Ohio River Basin to the small levee systems which protect numerous agricultural areas from floods in the Columbia River Basin. Construction was also continued or started during the year on reservoirs and local protection projects at important industrial areas in the Merrimack and Connecticut River Basins; on reservoirs and related works for the protection of numerous manufacturing centers in the Southern New York area of the Susquehanna Basin; on levees and flood walls for protection of several industrial cities along the Susquehanna River in Pennsylvania; on several units of the comprehensive plan for flood control in the Ohio River Basin, including the Mahoning, Loyahanna, and Youghiogeny Reservoirs, channel improvement work for protection of Johnstown, Pa., local protection for several important cities and towns along the main stem and tributaries of the Ohio River; on reservoirs in the basins of the Red, Arkansas, and White Rivers; on reservoirs, channel improvements and related works for the protection of the metropolitan area of Los Angeles and Orange Counties, California; and on reservoirs and bank protection works in the Willamette River Basin in Oregon. In the alluvial valley of the Mississippi

River work was continued on levee construction, floodways, reservoirs, and local protection works, including construction of Sardis Dam in the Yazoo Basin and Wappapello Dam on St. Francis River. In the Sacramento Valley the authorized program was advanced to 90 per cent of completion.

**ENGLAND.** See GREAT BRITAIN.

**ENGLAND, Church of.** The War continued in 1940 to affect in varying degrees every branch of the life and work of the Church of England. The year brought not only tribulation and loss but also vast new opportunities.

The material loss included the destruction of Coventry Cathedral; damage to Westminster Abbey, St. Paul's Cathedral, Canterbury Cathedral, Liverpool Cathedral, St. Martin-in-the-Fields, St. Margaret's, Westminster, St. James's, Piccadilly, St. Mary-le-Bow and other City churches, and to Lambeth Palace; and the destruction or injury of over 1000 churches, schools, halls, and vicarages in the country as a whole. The Archbishops of Canterbury and York appointed a special Commission in connection with the question of the repair, restoration, or rebuilding of churches or other Church property damaged by enemy action, and particularly to consider the provisions of the Government Insurance Bill and in due course the question of any general fund for the assistance of dioceses and parishes. The official statistics for 1939, published in December, 1940, in *The Official Year Book of the Church of England 1941*, showed that many Church activities had been gravely but not disastrously affected by evacuation, mobilization, the black-out, taxation, etc., in the first four months of the War; and by the uncertainties of the preceding period.

The archbishops, bishops, and clergy were tireless in exhortation and leadership, and Church organizations of all kinds co-operated in the vast migrations of women and children from the danger areas. The wonderful response of the younger clergy at the outbreak of the War to the need for Chaplains to the Forces had its sequel in the heroic work of those Chaplains in the evacuation of the B.E.F. from France. Some deliberately chose to become prisoners of war rather than leave the wounded and a number received rewards for gallantry.

Building work was continued in the course of the year on the new Cathedrals of Liverpool, Guildford, and Blackburn, and on the extension of Portsmouth Cathedral. H.M. the King opened, on June 10, the new Church House, Westminster, probably the world's most important architectural building completed in 1940, which is to be the central business headquarters of the Church of England and a center also for the whole of the Anglican Communion.

During the year more and more thought was given by leaders of opinion in the Church of England to postwar planning and reconstruction; and of the definite trends which quickly became discernible in such thinking perhaps none was so definite as the increasing realization of the important part which religious education must play in the educational system of the country after the War. Under the chairmanship of the Archbishop of York the important conference of the National Society and the Central and Diocesan Boards of

Finance, which first met in 1939, continued to press upon the dioceses the need for improved administration throughout the whole field of education. In particular it urged the need for diocesan surveys of Church schools and for Diocesan Directors of Religious Education. There was steadily increasing co-operation between the Church of England and the Free Churches in many spheres such as work for Refugees and especially in the sphere of education.

In the wider world of the Anglican Communion special mention must be made of the decision of the Nippon Seikokwai (Japan Holy Catholic Church) to assume complete independence of Western aid; of the continuing difficulties of the dioceses in China due to the war; of the very special difficulties of the Diocese of Gibraltar and the Anglican chaplaincies in the jurisdiction of Northern and Central Europe; of the affiliation of the Church of England to the World Council of Churches (in process of formation), which is to carry on officially the work of the Oecumenical Movement on behalf of the Churches; of the serious decline in the incomes of important British missionary societies, and of the generous decision of the Protestant Episcopal Church in the United States to include in its Budget a gift of \$300,000 in aid of the missionary work of the Church of England.

The year 1940 was the hundredth year of the existence of the Ecclesiastical Commissioners' Common Fund, which has added in one way or another upwards of £2,000,000 a year to the permanent value of benefices. In view of the war the Commissioners felt bound to defer further progress with permanent augmentation and are making income-grants to the clergy for the calendar year. The new schemes include not only a scheme of relief of pension-charges so far as they reduce the incomes of benefices below £350 but also a scheme of help of incumbents who owing to the war have lost benefice-income or suffered exceptional hardship of some other kind.

Among the appointments of the year were the following: The Right Rev. C. W. West-Watson to be Primate and Archbishop of the Province of New Zealand; The Right Rev. G. V. Smith to be Bishop of Leicester; The Ven R. Brook to be Bishop of St. Edmundsbury and Ipswich; The Rev. H. C. Montgomery Campbell to be Bishop Suffragan of Willesden, The Rev. M. H. Edwards, O.B.E., to be Chaplain-in-Chief, Royal Air Force; The Right Rev. H. Hensley Henson to be Canon of Westminster Abbey; Canon J. L. White to be Provost of the Cathedral Church of St. James, Bury St. Edmunds.

**ENGLISH LITERATURE.** See LITERATURE, ENGLISH AND AMERICAN.

**ENGRAVING.** See SCULPTURE.

**ENTOMOLOGY, Economic.** The Bureau of Entomology and Plant Quarantine is concerned with investigations on insects and their economic relations; the development and application of methods for their eradication or control; the carrying out, in co-operation with the States, of necessary work to prevent the spread and to control or eradicate insect pests and plant diseases that have gained more or less limited foothold in the United States; and the utilization of those species that are beneficial. These activities include investigations on and direction of control campaigns against the species injurious to agriculture and forestry; investigations on the species affecting the health of man and

animals, or infesting human habitations or injurious to industries; the culture and use of honeybees and beekeeping practices; investigations on the natural enemies of insects and plant pests and the possibility of using these as aids for control; the taxonomy, anatomy, physiology, and responses of insects; chemical and other problems relating to the composition, action, and application of insecticides; and the development of methods of manufacturing insecticides and materials used with them.

To aid in carrying out these assignments and to protect agriculture from plant pests and diseases, the Bureau is responsible for the strict enforcement of acts and restrictive orders promulgated thereunder.

During the year a building was completed in Hoboken, N.J., which is to be used for the inspecting of plant materials which may be imported under permit for propagation. The fourth floor of this new building has been specially designed and equipped to serve as a receiving station in connection with the introduction from foreign countries of natural enemies of insect pests.

**Apple and Pear Insects.** A new laboratory was established at Charlottesville, Va., to undertake the study of Comstock's mealybug, which has been reported with increasing frequency since 1934 from numerous orchards from South Carolina to Ohio and Connecticut. Three large-scale orchard tests of tree scrapings and banding to control codling moth were carried on at Yakima, Wash. Similar tests conducted during five seasons have shown that the parts of the orchard so treated produced more good fruit than the untreated blocks even when one less spray was applied. In the Hudson River Valley two sprays of phenothiazine following a light arsenical program successfully reduced a heavy infestation of the apple maggot.

**Peach Insects.** During the three years ending at the close of the 1939 season, 12 experimental releases of the most effective parasite of the oriental fruit moth were made to test the value of mass liberation of parasites early in the season in areas where the parasite is established, and all but one of these experiments has been followed by a lowering of ripe-fruit infestation in the year of release. In field cage experiments at Fort Valley dichloroethyl ether continued effective against larvae of the plum curculio in the soil.

**Peach Mosaic.** During the past year in the peach mosaic eradication campaign 96,173 properties were visited on which 3,851,000 trees were inspected, disclosing the presence of 64,194 mosaic-affected trees of which 18,396 had been removed at the end of the year 1939. An additional 155,600 trees, largely in abandoned orchards, were removed as a sanitary measure.

**Phony Peach Disease.** Co-operative activities for the control of phony peach during the past year resulted in the inspection of 92,000 properties on which were 13,051,000 trees of which 58,285 were found to be affected by this disease. Of the infected trees 27,533 had been removed by the end of the year and an additional 9,518,000 escaped and abandoned trees were removed as a sanitary and precautionary measure.

**Grape Insects.** A study by the Sandusky, Ohio, laboratory on the practical use of cultivation for controlling the grape berry moth in the vineyard indicates that about 86 per cent of the cocoons are found in a soil strip 18 inches wide directly under the vines. This emphasizes the importance of giving special attention to the area under the trellises,

which is the most difficult to reach. Only about 18 per cent of the moths are prevented from emerging by ordinary spring cultivation. Forty-five per cent of the moths were prevented from emerging by fall plowing, but the method as used in the experiment has certain serious disadvantages from a horticultural standpoint. An all-season treatment that included four applications of phenothiazine gave a high degree of control of the grape berry moth under conditions of moderate infestation. A tank-mix nicotine-bentonite program, which included four applications during the season, gave an outstanding degree of control, but it left such a heavy deposit of visible residue as to render the fruit unmarketable, except possibly for wine or juice.

**Japanese Beetle.** The area of general infestation of the Japanese beetle is approximately 16,300 square miles, an increase of 1183 square miles over that of last year. Trapping showed a carry-over of infestation in 78 cities and towns in non-regulated territory and 48 first-record infestations, the latter in Indiana, Maryland, Michigan, New York, Ohio, Pennsylvania, Virginia, and West Virginia. Lead arsenate was applied for the control of Japanese beetle to a total of nearly 900 acres in Georgia, Illinois, Indiana, Michigan, Missouri, New York, North Carolina, Ohio, and Virginia. During the summer of 1939 co-operative work was undertaken with the New Jersey Department of Agriculture and the University of Maryland for a colonization of Type A milky disease, a very effective disease in controlling grubs of Japanese beetle. In a natural inoculation of this disease in northeastern Maryland the population of white grubs was reduced from 38 to 6 per square foot. Two-thirds of the grubs found were affected with the disease. The most significant development on the work on fumigation of balled and potted nursery stock and farm products for the control of the larvae, eggs, and adults was the importance of the conditions under which the material is held during the post-fumigation period. Distribution of the two most important Japanese beetle parasites was continued.

**Pear Psylla in the Northwest.** A program for the suppression of an incipient infestation of the pear psylla in the Pacific Northwest was undertaken in co-operation with State agencies in Washington and Idaho. This insect was found for the first time in the Northwest in 1939. It has been known as a serious pest in the Northeastern States for more than 100 years.

**Pine Bark Beetles.** Field work on the hazard-inventory survey of the commercial ponderosa pine area in northeastern California was almost completed. This survey was based on the results of research in Oregon and California on the susceptibility of ponderosa pine to attack by insects, particularly bark beetles. Forest stands or areas have been given hazard ratings based on the history of their recent losses from insects and on the present condition of the individual trees. The most susceptible trees on the high-hazard areas may be marked for cutting. This will enable the owners to concentrate their logging operations in the areas where there is most danger of serious losses from bark beetles in the near future. The Forest Service and several large private operators in California and Oregon are making immediate use of the information supplied by the Bureau and are modifying their management plans to permit rapid and frequent coverage of their lands in an effort

to take out susceptible trees before these are attacked by insects and rendered worthless.

**Ambrosia Beetles.** Ambrosia beetles and the associated stains caused by fungi constitute one of the most serious problems of the lumber industry in the Southern States. Dichlorodiphenyl oxide gave consistent protection against damage by these insects and is now being tested on a commercial scale in the Gulf States. A simpler method of preventing attacks by ambrosia beetles is to end-rack lumber for from 12 to 15 days.

**European Spruce Sawfly.** An insect disease this year checked the inroads of the European spruce sawfly, an insect immigrant from northern and central Europe that has been defoliating spruce forests in New England for the last five years. An infection has almost wiped out the needle-eating worms in southern Vermont and southern New Hampshire.

**Gypsy Moth.** Eight thousand one hundred and twenty-two attracting cages in which were placed charges of an extract obtained from the tips of the abdomens of female moths in order to attract males and locate infestations were put out in 73 towns. Of these, 148 in 25 towns attracted male moths and resulted in the discovery of 98 infestations totaling approximately 9000 egg clusters. During the summer of 1939 defoliation of various degrees of intensity covered 492,640 acres, a substantial increase over the acreage recorded in 1938. Defoliation in the area between the Connecticut River and the barrier zone was slightly less than in the previous year, and no defoliation was recorded in the barrier zone or in New York, New Jersey, or Pennsylvania.

**Dutch Elm Disease.** During the fiscal year 1940 there was a 49-per cent reduction in the number of trees found to be infected by this disease. There were 16 confirmations of the finding of this disease outside of the major disease area. Since the discovery of this disease in the United States in 1930, 57,400 elms have been found to be infected. The entire zone in which field operations are being carried on is now 11,610 square miles, an increase of only 790 square miles over last year. During the year 9864 infected trees were removed and 206,540 additional trees were removed in the sanitation program and 56,428 trees in the selective operations. The grand total of all trees removed last year was over 773,000. This brings the grand total of elms that have been removed since 1933 to 5,576,680.

**White Pine Blister Rust.** The combined work of the Bureau and its co-operating agencies during the calendar year 1939 resulted in the eradication of 82,312,000 currant and gooseberry plants on white pine control areas covering 1,863,000 acres. There was no large extension of limits of the known infected area in this country. These bushes are the necessary alternate hosts for the very serious disease of pine known as white pine blister rust. The breeding of plants that are immune or resistant to attack by insects and insect-borne disease is occupying increasing attention of entomologists, plant breeders, and plant pathologists.

**Insect-Resistant Corn.** Extensive tests in several localities of inbred and hybrid field and sweet corn for resistance to the corn ear worm showed wide differences in the degree of infestation and give promise that reduction of injury by this insect may be accomplished through the eventual commercial use of resistant strains of corn. Simi-

lar breeding work for resistance of corn to attack by the European corn borer indicates similar possibilities.

**Insect-Resistant Wheat.** Continuation of the work in breeding wheat resistant to the attack of Hessian fly has resulted in the production of a variety that in California gives absolute immunity to Hessian fly infestation, whereas check varieties were 70-per cent infested. Similar, though not as conclusive, results were obtained on experimental breeding of hard red winter wheats in Kansas.

**Alfalfa Resistant to Pea Aphid.** Plant-breeding work with alfalfa resulted in the production of strains that show marked resistance to the pea aphid. Maximum plant infestation of resistant varieties never exceeded 22 per cent, whereas susceptible varieties were 100-per cent infested.

**White-fringed Beetle.** This insect has been apparently eradicated in several limited areas and materially reduced in all infested areas, thus lessening the danger of natural spread. Effective application of insecticidal dusts in nonresidential areas was accomplished by the use of Federal-owned airplanes. The total known area now infested by this insect comprises approximately 70,000 acres, located in Alabama, Florida, Mississippi, and Louisiana.

**Mormon Cricket.** Sodium fluosilicate bait was used in all infested States and gave satisfactory control even in areas of heavy infestation. This material has been specially valuable in districts where both grasshoppers and crickets are present. It is estimated that the control operations protected more than 1,000,000 acres of crop lands. Damage occurred on only about 7000 acres of crops.

**Grasshoppers.** Operations for the control of grasshoppers in 24 Western States were continued in co-operation with the several States and interested Federal agencies. The activities of the campaign for the 1939 crop season were especially effective on idle range land adjacent to crop land and resulted in a crop saving estimated at over \$128,000,000, or \$52 worth of crops for each Federal dollar spent on control. The outstanding accomplishment of the season's campaign was the effective control of infestations of the long-winged migratory grasshopper through the use of light airplanes for survey purposes and of heavy planes for the spreading of bait. The aerial equipment was brought into use in areas inaccessible by means of ground spreaders, where infestations were such as to constitute a menace to crop areas.

**Chinch Bug.** Fall surveys in 1939 indicated extensive infested areas in southern Iowa, the northern third of Missouri, southeastern Nebraska, the eastern third of Kansas, several counties in northeastern Oklahoma, and localized areas in Indiana and Illinois. Nearly 2½ million gallons of creosote were furnished by the Federal Government to 167 counties in these States. The use of this material resulted in very large savings of valuable corn crops.

**Black Stem Rust.** The co-operative control campaign to eradicate barberry bushes, which act as an alternate host for black stem rust of small grains, resulted in the removal of over 31,300,000 barberry bushes on over 2700 properties. This brings the grand total of barberry bushes removed to 259,000,000 on over 34,000 properties.

**Soil Fumigation for Wireworms.** Early experiments with dichloroethyl ether gave considerable promise. The margin of safety between effec-

tive dosage and plant injury, however, is narrow. Naphthalene as a soil fumigant is found to be effective only under certain soil type and temperature conditions.

**Sweet Potato Weevil.** Co-operating Federal-State control and eradication activities against the sweet potato weevil were continued during the year in Alabama, Georgia, Mississippi, and Texas. Four counties were released from quarantine, all infestations having been eliminated.

**Pink Bollworm.** During 1939, 400,000 acres in southern Texas were cleaned for the control of this pest. In the lower Rio Grande Valley there was an increase in infestation on both the Texas and Mexican sides of the river. There was a spread from that region to additional southern and southwestern Texas counties, and light infestations developed in several additional west-central counties of Texas in the vicinity of San Angelo and Colorado. During the past season all known wild-cotton colonies in southern Florida were cleaned twice and a considerable part of the area was cleaned three times. Over 1,000,000 cotton plants, seedlings, and sprouts were destroyed on approximately 39,000 acres.

**Foreign Parasite Introduction.** Owing to war conditions in Europe, the Bureau's field station for the collection of foreign parasites to be shipped to this country located at St. Cloud, France, was discontinued in October, 1939. Two members of the staff of this station were assigned to work in South America with headquarters at Montevideo, Uruguay.

**Insecticides.** During the year a new method for dispersing insecticides was devised. This consisted of spraying the liquid insecticides or solutions of insecticides on a hot surface so that the material is dispersed as smoke. Although in the experimental stage, this method may prove to be an efficient way of controlling insects in closed spaces. See BOTANY.

**ESTONIA.** A former Baltic State, which proclaimed its independence from Soviet Russia Feb. 24, 1918, and was reannexed to the U.S.S.R. as a constituent republic Aug. 6, 1940. Capital, Tallinn.

**Area and Population.** Estonia has an area of 18,359 square miles, including internal lakes, and a population estimated on Jan. 1, 1940, at 1,122,000. The population on Jan. 1, 1939, was estimated at 1,134,000. The decrease was attributed to the removal of Baltic Germans to German Poland and the exodus of Estonians who foresaw their country's absorption by Soviet Russia. Living births in 1939 numbered 18,450 (16.3 per 1000); deaths, 16,940 (15.0 per 1000). Estimated populations of the

chief cities on Jan. 1, 1939, were: Tallinn, 144,978; Tartu, 60,281; Narva, 23,834; Pärnu, 21,886.

**Religion and Education.** About five-sixths of the people are Lutherans and the rest chiefly Greek Orthodox and Roman Catholics. Adult illiteracy was slightly less than 4 per cent in 1940.

**Production.** Agriculture and dairying support nearly 70 per cent of the population. Yields of the chief crops in 1939 were (in metric tons): Wheat, 85,300; barley, 90,000; rye, 227,700; oats, 149,400; potatoes, 874,300; flax, 6100. The leading industrial products are cotton fabrics and yarn, woodpulp (112,000 metric tons in 1939), cellulose, paper, timber, shale oil. On Apr. 1, 1940, there were 56,456 wage earners in manufacturing establishments.

**Foreign Trade.** Total imports in 1939 were 101,351,000 crowns (107,198,000 in 1938) and exports of Estonian products were 118,217,000 crowns (103,928,000 in 1938). For trade distribution see 1939 YEAR BOOK; consult also the article on TRADE, FOREIGN in this volume.

**Finance.** For the fiscal year ending Mar. 31, 1941, the budget was estimated to balance at 114,988,740 krooni (crowns), as against revenues of 105,878,187 and expenditures of 105,816,637 krooni in the fiscal year 1939-40. The public debt on Jan. 1, 1940, totaled 127,605,613 crowns. The Estonian crown exchanged at an average rate of \$0.2711 in 1939 and \$0.2712 in 1938.

**Transportation.** In 1939 Estonia had about 1328 miles of railways; gross earnings totaled 17,762,000 crowns. Highways extended 13,416 miles. Airlines connected Tallinn with Helsinki, Leningrad, Stockholm, Berlin, Warsaw, and other cities. The gross tonnage of the merchant marine on Jan. 1, 1940, was 195,745.

**Government.** The Constitution effective Jan. 1, 1938, vested extensive powers in a President elected for six years. It provided for a bicameral National Assembly consisting of a Chamber of Deputies of 80 members elected by universal suffrage and a National Council of 40 members, chosen for the most part by public organizations and local governmental bodies. The President appointed a Premier, whose cabinet was responsible to the National Assembly. President at the beginning of 1940, Konstantin Päts, elected Apr. 24, 1938; Premier, Juri Uluots, appointed Oct. 12, 1939.

## HISTORY

**Soviet-Estonian Tension.** As was generally foreseen, the mutual assistance pact that Estonia was forced to conclude with the Soviet Union on Sept. 29, 1939, under threat of a Soviet invasion (see 1939 YEAR BOOK, p. 231), proved the first step toward the subjugation and sovietization of the little Baltic republic. The surface cordiality that marked relations between the Estonian Government and people, the newly installed Soviet garrisons, and the Moscow Government showed signs of wearing thin early in 1940. There were reports of widespread popular dissatisfaction with Estonia's status as a virtual Soviet protectorate. Civil and military officials of Estonia, Latvia, and Lithuania were said to have laid plans for closer co-operation in defense and other matters.

The Baltic Entente Conference, held in Riga, Latvia, on March 16, reiterated the "absolute neutrality" of Estonia, Latvia, and Lithuania in the struggles of the great European powers. Later that month the Russians enlarged their demands in Baltic Port (Paldiski). Although only a lease on part of the port was called for in the mutual

assistance pact, they forced the Estonian Government to evacuate all civilians from the port city. On May 15, in response to Estonian representations, the Kremlin agreed to remove all Russian garrison troops on the mainland, except those at Baltic Port, to the bases leased on the islands of Oesel and Dagoe.

**Russian Ultimatum.** During the spread of the European War into the Low Countries, the Soviet Government adopted a more belligerent tone toward Estonia and the other Baltic republics. On May 30 it established a forbidden zone along the Soviet-Estonian frontier. On June 17, the day after a Soviet ultimatum to Lithuania (q.v.), Estonia and Latvia received identical demands for the right of "free passage" of more Russian troops into their territories and the immediate formation of "governments that would insure honest implementation" of the mutual assistance pacts with the Soviet Government. The Estonian, Latvian, and Lithuanian governments and peoples were charged with unfriendliness toward the Soviet Union and with planning military collaboration against it. On the same day large Soviet forces entered Estonian territory.

Unable to resist, the Estonian Government accepted the Soviet demands. After agreeing to permit the stationing of Russian troops in the principal cities and towns, the Uluots Government resigned on June 21 in favor of a new government, headed by Dr. Johannes Vares, which was formed under the supervision of a representative of the Soviet Foreign Office. The new Cabinet consisted of pro-Soviet Socialists and professional men, none of whom had held government posts before. Gen. Juhan Laidoner, commander-in-chief of the army and hero of the war of independence in 1917-19, was replaced by Major General Rothberg, the new War Minister. The change in government was accompanied by an attempted revolt of armed Estonian Communist industrial workers, which was repressed by Estonian troops with a few casualties.

**Parliamentary Elections.** The Vares Government, under the direction of Moscow, quickly effected the transformation of Estonia from a nominally independent republic to an integral part of the Soviet Union. Parliament was dissolved, the Baltic Entente annulled, and anti-Soviet elements removed from governmental, military, and other positions. Communists working for outright union with Russia quickly obtained a commanding influence. On July 5 parliamentary elections were called for July 14-15. Only the candidates of the so-called Working Peoples' Bloc, controlled by the Communists and directed by Soviet Foreign Office agents, were permitted on the ballot. The Working Peoples' Bloc was composed almost entirely of the small class of Estonian industrial workers. The peasants, the bourgeoisie, and the intelligentsia, comprising the great bulk of the population, had little or no representation. Moreover mass arrests of the leaders of these anti-Communist elements took place on the eve of the parliamentary elections, and strong pressure was employed to secure the largest possible vote for the official candidates. The government announced that 81.6 per cent of the voters participated in the election and that 92.9 per cent voted for the candidates of the Working Peoples' Bloc.

**Annexation by U.S.S.R.** Immediately after the elections, a Moscow-directed campaign for union with the U.S.S.R. was conducted by the

controlled radio and press. On July 21 the newly elected National Assembly met, proclaimed Estonia a soviet republic, and voted to ask for incorporation in the Union of Soviet Socialist Republics. This petition, presented by Estonian delegates to the Supreme Soviet in Moscow, was accepted on August 6 when Estonia was incorporated as the 16th constituent republic of the Soviet Union. The final step in the process of governmental reorganization was the action of the National Assembly on August 24-25 in voting unanimously to adopt a soviet constitution. The secretary of the Estonian Communist party became president of the Council of People's Commissars.

Most of the Estonian diplomatic and consular representatives abroad denounced the annexation as an open violation of the Constitution and a cynical betrayal of every principal of representative government and national self-determination. The United States, Great Britain, and a few other foreign governments supported their stand by refusing to recognize the legality of Moscow's action and blocking Estonian assets within their respective jurisdictions. But in Germany, Italy, and the other countries dominated by the Axis, the representatives of the Baltic States were obliged to turn over their legations and consulates to Soviet officials.

**Sovietization and the Terror.** Meanwhile the complete introduction of the soviet economic, political, and social system was carried out in Estonia with increasing resort to terroristic tactics. Land, banks, industries, stocks of raw materials and goods, waterways, transportation facilities, etc., were nationalized. Properties of the larger landowners were redistributed among landless rural workers and those with small plots, pending eventual collectivization of agriculture. The Estonian army was co-ordinated with the Red Army and all officers suspected of anti-Soviet sympathies were ousted. The Soviet system of education was introduced. The theological faculty of Dorpat University and the Academy of Science were abolished. General Laidoner, President Päts, and other prominent members of the former regime were arrested. Properties of Estonians abroad who refused to return to Estonia were confiscated and their citizenship revoked.

Other characteristics of the Russian soviet state made their appearance—poor discipline among workers, economic disorganization, decreasing production, and growing scarcity of goods accompanied by charges of sabotage and "wrecking." The Soviet authorities dealt with these developments by the harsh methods customary in Russia. Following mass arrests of hundreds of persons, a people's tribunal was created on August 6 to wage a drive against "traitors." The decree provided the death penalty for "traitors," confiscation of their properties, and up to 10 years' imprisonment for members of their families.

**EUROPEAN WAR.** The military campaigns of 1939 including the German conquest of Poland and the start of Russian-Finnish hostilities are described in the YEAR BOOK, 1939, pp. 233-250. From the fall of 1939 to the spring of 1940 there was little activity in the Allied-German war save in the air and on the sea. During the winter months of January, February, and March, the major land operations took place in Finland. Because of the close relation existing between these two conflicts, the events in Finland provide the major military background for the decisive campaigns of the spring and summer in the main European theater of war.

#### THE FINNISH CAMPAIGN: JANUARY TO MARCH, 1940

The Russian attack on Finland began on Nov. 30, 1939, with a curious disregard for weather and terrain conditions. Apparently the Kremlin overestimated the support to be secured from so-called Finnish Communists and underestimated Finland's capacity for resistance. Theoretically Russia's huge army of 26 regular infantry divisions and 14 regular cavalry divisions, plus a first line reserve of 21 infantry divisions and 15 cavalry divisions, plus a force of 42 territorial reserve divisions, making up a total available force of 2,011,000 men, should have had little difficulty in overcoming Finland's army of 3 infantry divisions, 1 cavalry brigade, and 1 tank company. Employing a force estimated at 20 divisions on a front from Petsamo to the Karelian Isthmus, the Russian high command (Gen. Boris Shaposhnikov, chief of staff) attempted an invasion of Finland from five major directions. A holding attack by second class troops was made on the Karelian front. North of Lake Ladoga four Russian divisions advanced toward Sortavala and Suojärvi, a movement which was designed to flank the Mannerheim line on the Karelian front. Three divisions based on Kem advanced in the direction of Lieska. A similar force based on Repola made an advance toward Nurmes-Suomussalmi. Farther northward an advance was directed toward Salla and Kemijärvi by a force of troops based on Kandalaksha. In the far north Russian divisions based on Murmansk made an attack on Petsamo, Finland's only arctic port. These widely separated military movements were dependent for supplies on the single-track Leningrad-Murmansk railway.

At the outset of hostilities General Baron Mannerheim, commander-in-chief of the Finnish army, and his Chief of Staff, Gen. Lennart Oesch, were able to expand the peace-time army of 3 infantry divisions into 3 army corps of 2 divisions each by adding trained reserves. In addition to this small mobile army capable of offensive operations, Finland possessed a partially trained reserve of some 200,000 men capable of serving in secondary positions and guarding communications. This allowed the six "regular" Finnish divisions to be employed as a mass of maneuver against the Russian invad-

ing columns. Finnish divisional commanders Ostermann, Wallenius, Ohquist, Talvela, and Heiskanen distinguished themselves in the fighting of December and January.

**Finnish Victories in North.** Russian advances in December on the four fronts north of Lake Ladoga succeeded in making initial progress in spite of the weather and difficulties of the terrain. It was only after considerable progress was made in each sector that the Russians met with repulse and disaster. Finnish ski troops encircled the flanks of Russian columns which were strung out along the narrow forest roads, cut their communications, prevented food and supplies from reaching the Russian troops, pinned them to the ground and let the sub-zero weather add to the destructive fire of their rifles and sub-machine guns. By January all the Russian advance columns were in retreat and disorder. In some cases they were pushed beyond the Russian frontier.

In January, 1940, the reinforced Russian armies under the command of Gen. Gregory Stern made their major efforts north of Lake Ladoga on the central and north-central front. Diversion attacks were continued on the Karelian front but without apparent weight. The principal attacks were delivered without variation from the December pattern against Sortavala and Suomussalmi in the central sector and against Salla in the north-central sector. These attacks met with the same fate as the December attacks. Once again the mobile Finnish troops were able to isolate Russian divisions and decimate them. The Russian 163d division was destroyed in this area in December. In January the 44th Russian division was trapped and destroyed. Portions of the 54th division and the 164th division were cut to pieces in the fighting on the Suomussalmi-Raate front. The strategic aim of these movements was to cut across the "waist" of Finland to menace her rail communications with Sweden. In the fighting north of Lake Ladoga in January the 34th Moscow Tank Brigade was surrounded and destroyed.

**Mannerheim Line Pierced.** As a result of the failures of January, Gen. Kyril A. Meretskov, commander of the Leningrad Military District, was replaced by Gen. Simeon Budenny, famed Cossack leader. Marshal S. Timoshenko took charge of all Russian operations against Finland. The whole strategy of the Finnish war underwent an immediate change. The main efforts from February on were concentrated on the Karelian front. Troops estimated at 300,000 were massed for an assault on the Mannerheim line. Russian bombers operating from nearby airfields made repeated attacks on Finnish railways and industrial districts. Heavy and railway artillery, tanks, armored sledges, flame-throwing equipment, and men were thrown into the attack. Minor diversions north of Lake Ladoga were attempted, but the 18th Russian division suffered heavily in the open warfare against elusive Finnish troops.

With the massing of Russian forces on the Karelian front the warfare took on the character of the Verdun battle of 1916. From February 1 to 10 almost constant artillery fire fell upon the Finnish fortifications in the Summa sector of the line. The famed Mannerheim line in this area consisted of concrete pill-boxes mounting cannon and machine guns, protected from tank attack by boulders and natural obstacles. At the height of the attack 300,000 artillery shells a day were fired at the Finnish positions. Russian infantry in armored sledges

*Courtesy of New York Times*

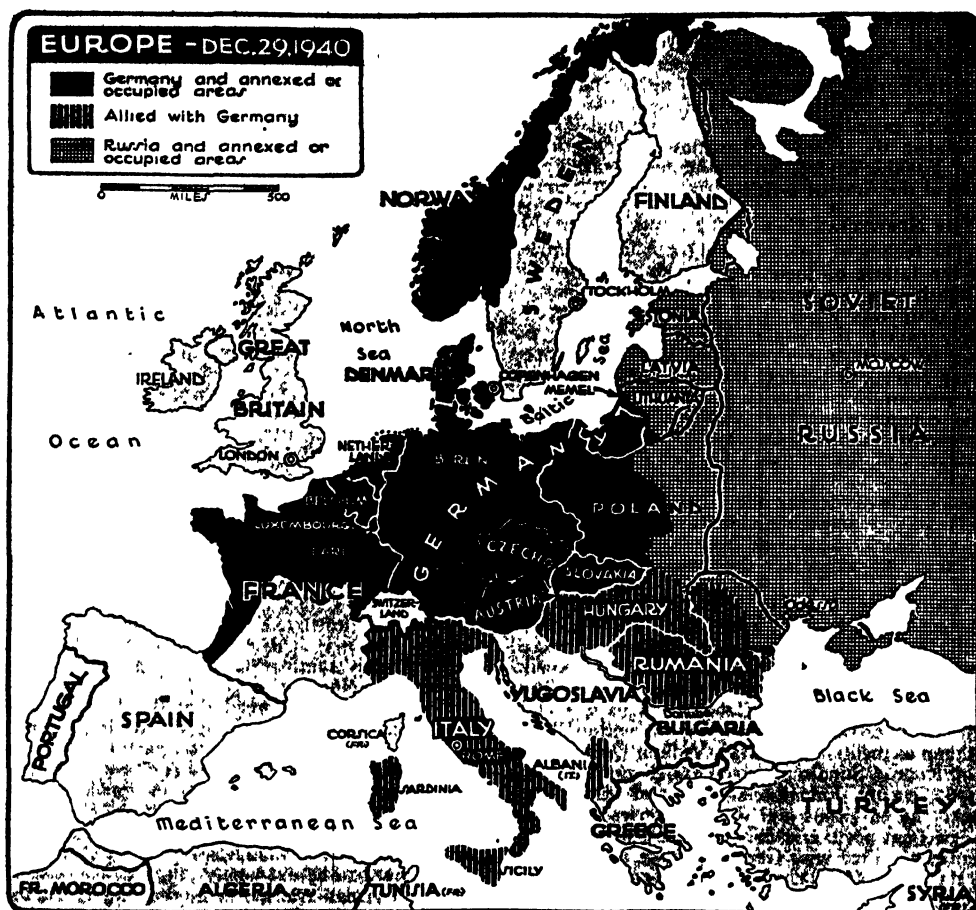

towed by tanks advanced against the fortifications covered by artillery and machine gun barrages. Engineers and demolition squads blasted away tank traps and wire. The type of attrition warfare which developed cost the Russians heavily in casualties, but it placed the Finnish high command at great disadvantage. The defending army lost the superiority in maneuver which had gained the impressive victories of December and January.

The six regular divisions which were the backbone of Finnish resistance were swallowed up in the battle of matériel. It was found impossible to relieve the exhausted Finnish troops on the Mannerheim front, for reserve troops and foreign volunteers proved unequal to the strain of constant artillery attack. On February 13 the Finnish Government appealed for outside aid on a large scale and called up men of 43 years of age.

Heavy fighting on February 14-16 on the Summa front led to the capture of that city on the 16th. The assault was led by crack Soviet troops, the 100th, the 103d, and 49th divisions. By February 23 the Russian advance had reached to within seven miles of Viipuri (Viborg), the key city to the western flank of the Mannerheim line. Koivisto Island in Viipuri Bay was attacked on February 24. Russian raiding parties advancing over the ice of Viipuri Bay during the last week of February

threatened to outflank Viipuri. In the face of heavy resistance advanced elements of the Russian army entered the outskirts of Viipuri on March 11. Fighting ceased on all fronts at 11 a.m. on March 12 with the conclusion of Russian-Finnish peace negotiations. See FINLAND under *History*, for peace terms.

When the war ended Finland's small army, though having suffered heavy losses, was still intact. Her main industries and railway communications were still functioning in spite of Russian bombing attacks. Continued resistance was possible, but after the full pressure of the Russian drive on the Karelian front had pierced her strongest fortified position, all hopes for a Finnish victory disappeared. That Baron Mannerheim was willing to accept the harsh terms offered on March 12 was vindication of the Russian strategy of concentrating on the Karelian front. The power and drive displayed by the Russian army in this campaign surprised the outside world and dismayed the Finns. Though the conquest of Finland did not enhance the prestige of the Red Army, it did reveal the fact that Russian military equipment was of modern design and good quality. Several Russian innovations such as the multiple incendiary bomb ("Molotov's breadbasket") and parachute troops were imitated by the German army.

Courtesy of New York Times

The fall of the Mannerheim line revealed serious engineering defects in its construction. The heavy concrete pill-boxes of this line were not anchored sufficiently with concrete aprons. As a result prolonged shelling by Russian artillery undermined the forward face of the emplacements causing them to sag. This threw the guns of the emplacement out of alignment and restricted their field of fire. Although similar defects were not necessarily involved in the construction of the Maginot and Siegfried lines, the fall of the Mannerheim line gave grounds for doubting the impregnability of formal fortifications. It may have influenced the German high command in its decision to attack the French and Belgian fortified positions in the west.

**Foreign Aid to Finland.** Since Russia was an ally of Germany the conclusion of the Finnish war was regarded in France and Britain as a blow to their cause. As long as Russia was involved in the war with Finland the amount of material aid she could render to Germany was negligible. The failure of the Allied governments to send substantial aid to Finland was widely criticized. According to French and British statements the aid sent included 285 planes, 590 guns, 100 anti-tank rifles, 5000 machine guns, 200,000 hand grenades, 60,000,000 rounds of small arms ammunition, and a great

many other items of needed military equipment.

That the Allied governments considered sending military forces to aid Finland was revealed by Premier Daladier of France who said that a force of 50,000 French troops was concentrated in embarkation points as early as February 26. Sweden's refusal to permit the transit of these troops across her territory made this move impossible. No doubt the government of Sweden feared that Germany would look upon the movement of so large a body of Allied troops through Swedish territory as endangering her supply of iron ore from the famous Kiruna mines. That Germany would take military steps to prevent this was regarded as a certainty in Sweden. Thus, the fear of extending the general European war to the Baltic countries prevented large-scale aid from reaching Finland even though some 8000-10,000 foreign volunteers, mostly Swedish, attempted to aid the Finns. See FRANCE, GREAT BRITAIN, and SWEDEN under *History*.

The severity of the Russo-Finnish peace terms, following the heroic resistance of the small Finnish nation, swept aside whatever doubts remained about the reality of the Russian victory. That they left Finland a virtual prisoner in the Baltic and robbed her of the strongest defense zones she possessed could not be concealed.

**Estimated Casualties.** Official Russian reports set their casualties in the Finnish war as 48,745 killed and 158,000 wounded. General Mannerheim set the Finnish losses at 15,000 killed and 30,000 wounded. Neutral sources in Scandinavia set the Russian casualties as 200,000 killed and 250,000 wounded, the Finnish casualties at 30,000 killed and 35,000 wounded. No reliable figures are available at the time of writing.

#### THE NORWEGIAN CAMPAIGN: APRIL 9-JUNE 10

The feeling of frustration in the Allied countries at the failure of their governments to utilize the Finnish war as a means of attacking the flank of Germany was widespread. Efforts were immediately made to tighten the blockade by stopping the flow of Swedish iron ore which had been shipped from Narvik throughout the winter in the relative security of Norwegian territorial waters. Charges and counter charges of violation of Norwegian neutrality followed. On April 7 a British submarine sank the German transport *Rio de Janeiro* which was loaded with fully equipped German troops. The same day the British Admiralty announced that minelaying operations had taken place in Norwegian territorial waters. This gave the Germans an excuse for the invasion of Denmark and Norway on April 9.

**The Surprise Attack.** Using the pretext that Denmark and Norway were about to be used as Allied bases against Germany, Nazi troops poured into Denmark in the early morning hours of April 9 and received the surrender of that state (see DENMARK under *History*). Elaborate plans were laid for the betrayal of Norway from within. Fifth column elements led by Maj. Vidkun Quisling and Col. Konrad Sundlo prepared to deliver vital ports to the enemy. Faked telegrams and orders confused the garrisons and shore batteries defending Norwegian ports and minefields. "Wooden horse" transports filled with German troops were waiting in the harbors of Trondheim and Narvik. First indications of the treacherous assault came at 4:30 a.m. on April 9 when two German destroyers appeared in a snow storm at Narvik, sank two Norwegian gunboats and a number of British steamers. Proceeding to the inner harbor they landed troops which took over the city. Similar landings surprised the Norwegian garrisons at Bergen, Trondheim, and Stavanger. By mid day the principal ports of Norway had passed into German hands.

If adequately defended the fjord of Oslo should have been almost impregnable to attack. Elaborate minefields and well-placed batteries defended the approaches to the capital. But the defending troops were confused by the receipt of what seemed like official telegrams and orders not to resist the Germans. German war vessels and transports passed through minefields whose contacts had been disconnected and under the muzzles of guns which could have blasted them out of the water. Norwegian naval cadets were taken aboard German vessels as hostages. Only a single minesweeper which had not received faked orders resisted. It torpedoed the German cruiser *Emden*. A few batteries at Horten opened fire on the cruiser *Blucher* and sank it. But aside from these events the great landing passed off successfully while the German air force cowed the capital with massed flights of bombers. By 4 p.m. Oslo had been occupied. The entrance was made by 1500 Nazi troops led by bands and by the Oslo police force. Its fall was

brought about by acts of treachery and cynicism unequalled in modern war.

The fall of the capital disorganized Norwegian plans for resistance, because Oslo was the headquarters of the army organization. Most of the limited anti-aircraft guns were in the capital and fell into the hands of the Germans. The peacetime army consisted of only 15,000 men (main reserves approximately 80,000 men) and was organized on a militia basis in nine brigades. There were no mechanized units; the army possessed very little modern artillery, and less than 150 planes. The small Norwegian navy of 4 gunboats, 8 destroyers, and 9 submarines was lost when the big ports were captured. The coast defense forces at Kristiansand resisted the German landing and sank the cruiser *Karlsruhe* by gunfire. It was under these discouraging circumstances and with this limited force that the Norwegian Government retired from Oslo to Hamar and Elverum to prepare further resistance.

**The Naval-Air Struggle.** At the close of April 9 not more than 20,000 Germans had been landed in Norway. With Allied promises of aid to Norway, the success of the German campaign depended upon the speed with which she could reinforce her small garrisons in the captured ports. Unless Germany could throw more men into the ports and maintain lines of supply, they would ultimately be destroyed by Allied and Norwegian forces. The principal Allied objective became to prevent such reinforcements from reaching the Germans in Norway.

Hopes were widespread that the British navy, which had failed to prevent the daring German landings, would now be able to attack the sea communications between Germany and Norway. Winston Churchill made promises in Parliament on April 12 that every German ship in the Skagerrak and Kattegat would be sunk. But naval operations in areas controlled by land-based German air squadrons proved to be extremely difficult. The task of sinking German transports in the Skagerrak had to be entrusted to British submarines. Perhaps the German success in striking the British battlecruiser *Rodney* with a 1000 lb. bomb in the first days of the campaign caused British heavy units to shun the coastal area.

In any event the British fleet failed to bring any heavy German units to battle save for an indecisive clash between the *Renown* and the *Scharnhorst* off Narvik. Farther north outside the immediate zone of German air supremacy British naval units acted with more resolution. A small British destroyer flotilla (five ships led by Captain Warburton-Lee) rushed into Narvik fjord on April 12 to attack the German destroyer forces and though sinking some German craft was forced to retire with the loss of two vessels. This reverse was avenged on April 14 when the battleship *Warspite* and nine destroyers entered Narvik fjord and sank the whole flotilla of seven German destroyers. Elsewhere there were no major German naval losses though many transports were reported sunk.

Since Trondheim, the principal port in central Norway, was spacious enough to permit operations of large naval units, proposals were put forward in Britain that the port be rushed by heavy units of the fleet. Admiral Sir Roger Keyes of Zeebrugge fame offered to take command of this necessarily hazardous mission. It was decided, however, that Allied landing parties operating from north and south of Trondheim could force the German gar-

rison out with less difficulty. This decision led to the organization of an Allied expeditionary force which reached Norway on April 15.

**Allied Land Force Defeated.** Before the Norwegian campaign was many hours old, it became apparent that the German high command was making energetic use of its air force to reinforce the troops in Norway. This was particularly true of the small force at Narvik which was a full 1000 miles removed from German bases by sea. When the Allied expeditionary force under Gen. Carton de Wiart reached Norway on April 15, it was forced to disembark in the small secondary ports of Laerdal, Namsos, Aandsnes, Aalesund, Molde, and Bodoe. These ports lacked dock and harbor facilities for handling heavy equipment. The landing took place without great loss but the Allied force soon came under heavy attack from German air squadrons. It was found that the Allied expeditionary force consisted in part of raw territorial units and French colonial troops. There was a tragic shortage of anti-aircraft equipment. The Royal Air Force operated under the handicap of having to fly from British bases or carriers while the Germans enjoyed the use of Norwegian air fields.

One Allied column operating with Norwegian support made an advance southward from Namsos toward the railway line connecting Trondheim with Oslo. Another column moved west and northward from Aandsnes and Molde toward Dombaas and Stoeren. Had either of these movements been made with sufficient speed and strength the whole German campaign in Norway might have been frustrated. But the Allied expeditionary force turned out to be only some 12,000 men. The troops moving from Namsos ran into a savage German counter attack at Steinkjer and retreated under heavy air bombardment. Bombing raids by German planes turned Namsos into a veritable shambles.

For a time it seemed that the Allied advance toward Dombaas would be successful, but Gen. Nikolaus von Falkenhorst moved mechanized columns with such unexpected speed up the Osterdaal and Gudbrandsdaal that a juncture with the German forces at Trondheim was made on April 30. This surprising development nullified the strategy and purpose of the Allied expeditionary force, and amid quarrels with the Norwegian army command the whole force was evacuated from the Trondheim area by May 3. The bulk of the Norwegian forces surrendered. The Norwegian King and members of the government announced their determination to continue the struggle, and did so, first in the Narvik district and later from England. See *NORWAY under History*.

**Narvik Abandoned.** Allied landing parties and a small Norwegian force maintained slow pressure on the isolated German garrison at Narvik and finally captured the city on May 30. This minor triumph was almost overlooked in the confusion of the battle of Flanders. In the face of the defeat of France and the threat of a German invasion of Britain, the Narvik force was evacuated on June 10. As if to set the seal of defeat on a totally unhappy venture, the British navy suffered the loss of the aircraft carrier *Glorious*, two destroyers and two transports in this operation. The German victory in Norway vastly increased the blockade difficulties of the British by extending the German control of the coast of Europe to North Cape. Though German losses in transport tonnage were

heavy, these were more than made up by the amount of shipping captured in Danish and Norwegian ports.

Official German reports gave the total casualties in the Norwegian campaign at 5296 killed and wounded. There are no reliable figures available for British, French, Polish, and Norwegian losses.

#### THE BATTLE OF FLANDERS: MAY 10-JUNE 5

The sequence of events in May and June shows that the Norwegian campaign of April was part of the German grand strategy of 1940. The occupation of the whole coast of Norway gave the Germans tremendous advantages in the naval war against Britain. It added one more block to the Nazi-dominated area in central Europe. In view of the impending German assault in the west in May, the Norwegian campaign may have been intended as a gigantic diversion to draw off Allied strength northward. The diversion effect, however, was slight since the Allies did not send large forces to Norway. The pretext for the invasion of the Low Countries was the same as that used in Denmark and Norway. Holland and Belgium were charged with being parties to Allied plots to use their territories as a base of operations against Germany.

There had been only local action on the western front since the commencement of hostilities in September, 1939. Under the cautious strategy of Gamelin the French had made short advances in the German territory between the Maginot line and the German Westwall in the fall of 1939. These gains had been gradually reduced by equally cautious German advances in the winter and spring of 1940.

**Allied-German Strategy and Forces.** The essential strategy of Generalissimo Marie Gustave Gamelin was to trick the Germans into a costly attack on the "impregnable" Maginot line. If necessary the Allies were prepared to wait until the blockade forced Germany to attack them in the west.

The Allied defensive plan of war was built up around the famed Maginot line protecting France from Switzerland to the Belgian frontier. From that point northward the Allied flank was covered by Belgian fortifications extending from Montmédy to Maastricht and by the strong Albert Canal line to Antwerp. There were strong fortifications along the Meuse at Liège and Namur, and a rear defensive line along the Dyle river. Some of these works, especially the modern forts at Liège, were held to be equal to any in Europe. The defensive positions of the Netherlands included a forward IJssel line, the Grebbe-Peel line, and the Fortress of Holland line.

These defensive positions depended for their full efficiency on a system of inundations and on the destruction of the main bridges over Dutch rivers. After King Leopold of Belgium had renounced the French alliance in 1936, the French contemplated extending the Maginot line northward to the sea, but by the spring of 1940 it consisted merely of a few strong points supported by a chain of concrete pill-boxes. At no place north of Montmédy did the Maginot extension approach the scale or strength of the Maginot line proper. The combined strength of all these positions, however, was regarded as so great that a German attack was regarded as unlikely by many military critics. The Allied defensive scheme of war had received its most convincing explanation just prior to the out-

break of war in 1939 in Capt. B. H. Liddell Hart's book *The Defence of Britain*.

When the German assault came on May 10 the western front was defended by 115 divisions of the Metropolitan army of France (General Gamelin, generalissimo), by 10 divisions of the British Expeditionary Force (General Viscount Gort, commander-in-chief), by 16 Belgian divisions (King Leopold in command), and by 14 Dutch divisions (Gen. Henri Winkelman, commander-in-chief). Against these forces the German high command (Gen. Wilhelm Keitel, chief of staff of the German armed forces, and Gen. Walther von Brauchitsch, commander-in-chief of the field armies) could concentrate a force of from 150-200 divisions, giving them a slight initial advantage in numbers but not the three-to-one superiority in mass held to be essential for success in an attack. The lack of co-ordination between the Allied-Dutch-Belgian forces could be counted on to increase the German advantages in numbers. By their assumption of the initiative and ability to concentrate mechanized strength and air power at the decisive point, the Germans gained fatal advantages over the Allies whose separate air forces and mechanized units were necessarily employed piecemeal and without maximum effect.

The battle of Flanders was but a part of the German plan of war. It contemplated the destruction in detail of the Dutch and Belgian armies, a break through to the coast endangering northern Allied units, and a final decisive battle against France from a position outflanking the Maginot line. The German plan was original and daring in conception. It went counter to the main German strategic concepts which since 1896 reflected the views of Count Alfred von Schlieffen.

The German movement in the west was heralded by widespread German bombing attacks on Allied, Dutch, and Belgian air bases. This attack delivered in the early morning hours of May 10 caught the Allied air force napping. Since aerial warfare had been confined to reconnaissance flights and individual dog-fights, they were unprepared for this sudden attack on their bases. Many planes were destroyed on the ground. French, Dutch, and Belgian cities far behind the lines which had enjoyed complete immunity from attack felt the power of German bombers. The "phony" war in the west suddenly became real. As if acting upon the Schlieffen plan, German troops invaded Holland and Belgium before daybreak. General Gamelin was so certain of the course of the German attack that his order of the day included the phrase "the attack which we have been expecting since September has at last arrived."

Conquest of the Netherlands. The German attack on Holland was entrusted to seven divisions of the 18th army (General von Keuchler) which advanced in three columns. One crossed the Dutch frontier in the north and moved directly toward Utrecht. Another column crossed the Gennep bridge, broke through the IJssel line and advanced toward Hertogenbosch which it captured after two days. A third column crossed the frontier at Roermond and advanced in the direction of Breda. Although the Dutch army opposing the advance of these columns consisted of twice the number of divisions, they were unable to hinder the advance due to the failure to destroy important bridges and to the helplessness of the Dutch forces under German air attack. Most important of all was the stunning "vertical envelopment" of the Dutch rear car-

ried out by German parachute troops and fifth column elements.

Before the Dutch had begun to fight parts of their capital and many of their important communications centers were in the hands of the enemy. Parachute troops had been employed by the Russians in Finland but with such scant success that no army in the world save the Germans took them seriously before May 10. Early in the morning German parachute troops were landed at the Waalhaven airport in Rotterdam and took possession of that vital point. German seaplanes landed troops in the Maas River. Innocent looking barges lying in the harbor discharged fully equipped German troops. Street fighting spread through the city. Similar landings took place at The Hague, at Delft, and at Dordrecht.

These troops and Dutch Nazi sympathizers made it possible for the Germans to capture the vital bridges at Gennep, Roermond, Moerdijk, and Dordrecht intact. The Dutch were prepared to wage war in the conventional 1914-18 pattern, but they were utterly unprepared for the confusion which followed these developments. General Winkelman, who anticipated a long struggle against the Germans, found himself trying to direct operations from his headquarters in The Hague whilst street fighting was raging around him on the first day of the assault.

Dutch appeals for help made on the morning of May 10 brought a French motorized division as far north as Breda by May 11. This remarkably speedy transport performance came to naught, however, when the French units became involved in the general confusion and retreated without materially affecting the course of the battle. The German armored column which took Hertogenbosch on May 12 advanced over the Moerdijk bridge and joined with the German parachute troops at Dordrecht on May 13. Contact was also made with the German troops at Rotterdam where severe fighting raged around the airport. Efforts of the German parachute troops to capture the Royal family caused them to seek refuge in Britain. By the night of May 13 confusion reigned supreme in Holland. The Dutch field army had been cut in two by the rapid penetration of German mechanized columns. Allied reinforcements began to retreat as soon as they arrived. It was in these circumstances that the German high command made use of the German air force to crack Dutch morale and force a speedy termination of hostilities.

At noon on May 14 the German Luftwaffe carried out a systematic bombing of the business district of Rotterdam which lasted for an hour and a half. Fifty-four planes operating from a field close to the Dutch border flew over the city in relays dropping their bombs in formation and quickly returning with another load. The Dutch anti-aircraft defense system was undergoing reorganization when the war broke out; the Dutch air force had been virtually grounded by the loss of its airports, and the German bombers were able to carry out the attack without interference. The raid devastated seven solid blocks of apartment houses and department stores, and set fire to the water front. Thousands of civilians (Dutch estimates say 20,000 to 30,000) were killed and wounded. There were no adequate air-raid shelters in large Dutch cities; and under the German threat to carry out similar raids on Amsterdam, Utrecht, and The Hague, General Winkelman was forced to suspend hostilities at 4 p.m. on May 14. The armistice was opera-

tive in all Dutch provinces except Zeeland where a small British landing party was trying to evacuate. The Royal Dutch Navy was ordered to continue a defense of Dutch colonial possessions. See *NETHERLANDS, THE*, under *History*.

So rapid had been the collapse of Dutch resistance that when the armistice came the Dutch army, though completely outmaneuvered, was still intact. Its losses, which were at first widely set at 40 per cent of their effectives, turned out to be less than 23,000 men. When the Dutch experience was added to that of Poland and Norway, it showed how completely inadequate were the conventional concepts of defense against total war.

**German Diversion against Belgium.** While the 18th German army was completing the destruction of Holland, the 6th (General Reichenau) and 4th German armies (General von Kluge) made an attack on Belgium accompanied by extensive air raids on Belgian airports. The 6th army moved across the Maastricht district of Holland and advanced directly against the Albert Canal position. Air infantry enabled them to capture two bridges intact and make a crossing of the water line. The 4th army astonished the world by capturing powerful Fort Eben Emael on May 12 and the city of Liège on May 13. Fort Eben Emael was the key to the Meuse defenses and its early fall dismayed the Allied world. The capture of this great strong point, at first attributed to a "secret weapon," was in reality brought about by a remarkably co-ordinated attack by pioneer (engineer) battalions and air troops landed by parachute or glider in the courtyard of the fort. The German troops engaged were said to have carried out practises on a model of the fort constructed in Poland during the winter. Immediately after the fall of the city of Liège, the 6th army pressed forward along the Meuse in the direction of Namur and Thionville. Thus far the German movements in the north looked essentially like the Schlieffen plan.

As if in automatic response to the heavy attacks of the 4th and 6th German armies in Belgium, Allied reinforcements sped northward with trucks and tanks on May 11. These forces consisted of the 7th French army (General Billotte), the 1st French army (General Blanchard), and the British Expeditionary Force (General Gort). Together with the French Cavalry Corps (General Prioux), the "relief" force comprised 30 divisions of the best trained and equipped troops in France. The movement northward was carried out with such speed that by May 14 all these divisions were north of the Belgian frontier. When, therefore, the main German blow fell at Sedan on May 14 breaking the Maginot extension, these 30 divisions were north of the break-through point.

Elsewhere in the war the Allied relief forces had been too weak and too late. In this case ironically they were too fast. They no sooner reached Belgian soil than the whole strategic purpose of their arrival was nullified by the German break-through at Sedan. After May 15 it was no longer a question of the defense of Belgium. Their main objective became to escape the gigantic trap into which they had fallen. This was the crowning blow of the war.

**The Main German Attack at Sedan.** While the Allied relief forces moved northward into Belgium, the main strategic aims of the German attack became clear. An attack was made on May 14 by 10 German armored divisions of the 2nd and 12th German armies (Generals Strauss and List)

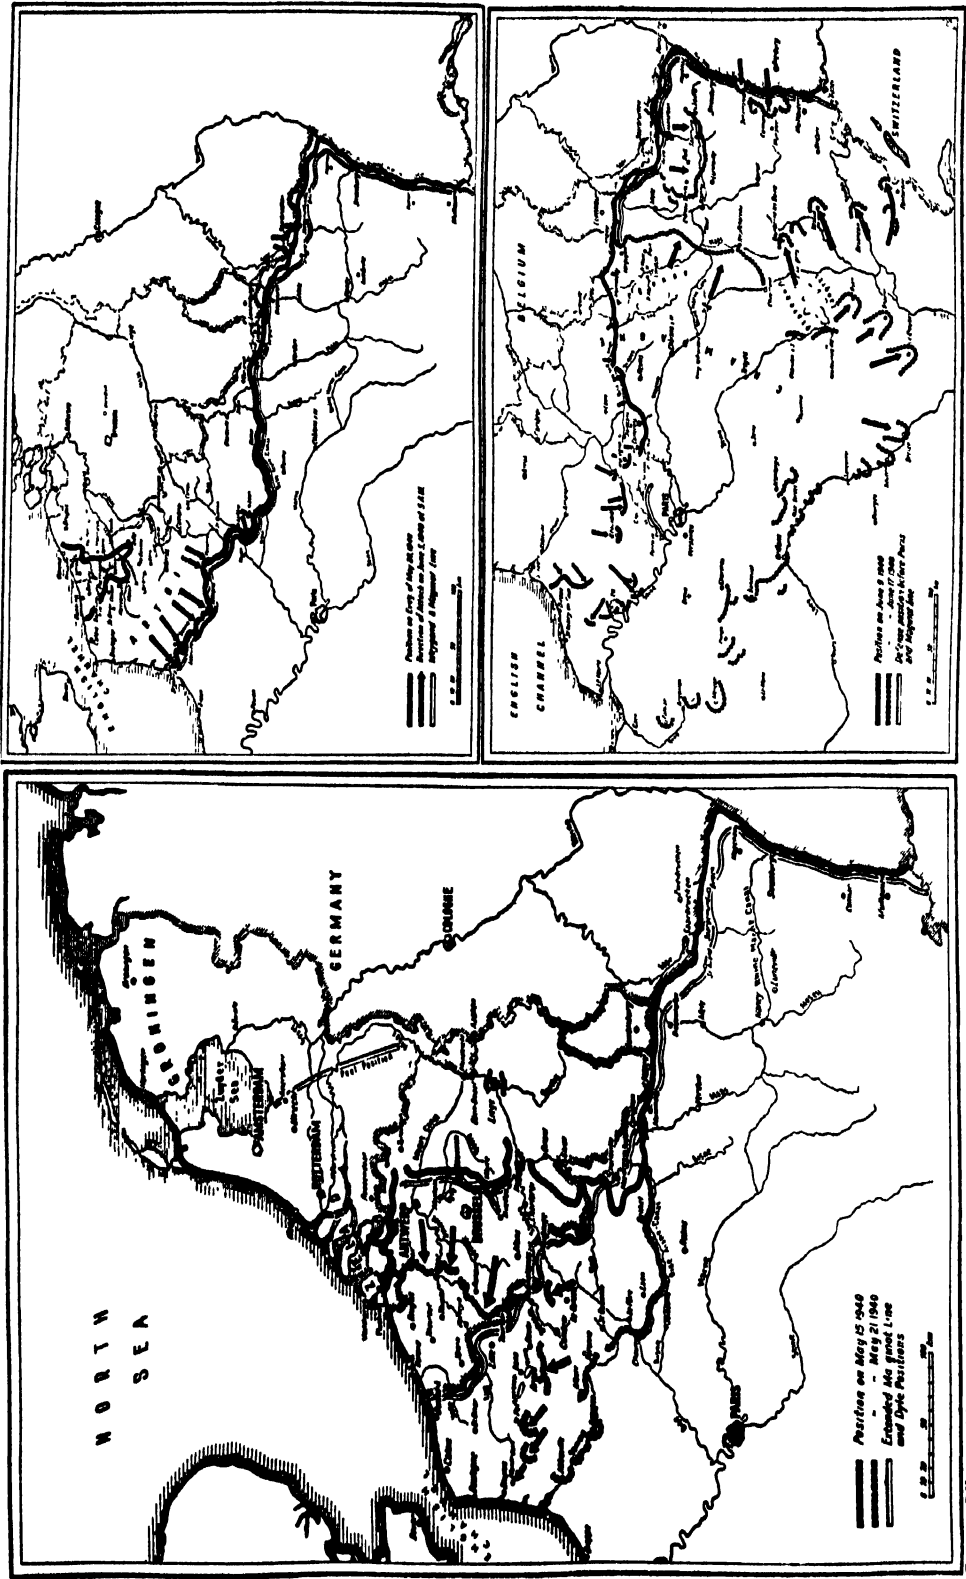

at Sedan with the 9th German army (General Weichs) in reserve. Thus a total mass of 70 German divisions fell upon the weak French 9th army (General Corap). The attack was prepared by 1000 dive bombers which rained destruction on the pill-boxes of the Maginot extension. Combat teams made up of pioneers and shock infantry filtered between French strong points, blasted pill-boxes and mopped up small units. French military leadership and training was not equal to these well-co-ordinated movements. The 9th French army was virtually destroyed as a fighting force in two days of battle.

Once the Maginot extension was broken, 10 German armored divisions rolled forward to Mézières, then to St. Quentin, Peronne, Amiens, and finally to Abbeville, which was reached on May 21. The 30 Allied divisions in the north were now completely cut off from the main French forces in the south. Behind the steel front of the armored divisions moved the 2nd, 12th, and 9th German armies, in Mr. Churchill's phrase "the dull brute mass of German infantry." What at first appeared to be a raid of armored units in great depth (as in Poland) turned out to be the amazingly rapid advance of three whole German armies which averaged more than 25 miles a day. The German armored units which reached Abbeville on May 21, turned northward and captured Boulogne on May 26. Its advance was checked for a few days at Calais by the heroic resistance of British territorial units, but by June 1 the German column was threatening Dunkirk from the south. What amazed military critics was the ability of the German army to maintain supplies for these advance forces. The exploit showed the closest kind of co-ordination between all arms in the German army. In audacity and execution it stood unrivaled in military history.

**Allied Generals Replaced.** Seven days of warfare in the west was sufficient to reveal the shortcomings of the Gamelin concept of war. Prime Minister Reynaud had never sympathized with his views and had been on the point of replacing him early in May. Four days after the break-through at Sedan he called the aged Marshal Pétain from Madrid to assume the post of Vice-Premier. On May 19 General Gamelin was replaced by Gen. Maxime Weygand who had arrived from Syria by plane. The German blow on May 10 toppled the government of Mr. Chamberlain, and Mr. Churchill became Prime Minister on May 11. On May 26 Gen. Sir Edmund Ironside, chief of the Imperial General Staff, was replaced by Gen. Sir John Greer Dill. Thus there were changes in command in both France and Britain during the crisis of May.

General Weygand, whose attitude on arrival in Paris was one of confidence, made several trips over the Somme battlefield by plane and attended a number of conferences with French, British, and Belgian leaders. He was appalled by the confusion created by the German break-through to the coast, but attempted to organize a counter attack to cut the Somme gap. Meantime the Allied and Belgian armies in the north retreated steadily under pressure of the 4th and 6th German armies. They retired from the Dyle line to the Dendre River on May 17. The retirement continued until May 27 when the Allied line in Flanders formed a rough triangle from Dunkirk to Valenciennes to Bruges.

Weygand's efforts to organize a single co-ordinated counter attack failed when General Billotte was killed in a motor accident and misunderstandings between Generals Ironside, Blanchard, and

their staffs caused delays. On account of this failure the Allied counter attacks against the Somme gap were made in unco-ordinated fashion. Successful attempts at Maubeuge and Valenciennes on May 21, at Arras on May 22, at Cambrai on May 23, and at Amiens on May 24 failed. At no one point were the Allied forces in sufficient strength to make substantial progress against the German concentrations. Thus, though every armchair strategist in the world knew that a decisive Allied counter attack on the Somme was called for, it could not be organized under the existing chaotic conditions.

**The Evacuation from Dunkirk.** The British Admiralty began to concentrate small craft soon after May 14 from their pool of small vessels. Plans for the evacuation of the British Expeditionary Force must have been made long in advance, because withdrawals of troops began at Dunkirk as early as May 20. These facts were not known to the outside world at the time, but may have influenced the Belgian King in his decision to surrender. On May 28, with the failure of the Allied counter offensive apparent, and with little prospect of evacuating the Belgian army, King Leopold accepted terms amounting to unconditional surrender (see *BELGIUM* under *History*). This exposed the northern flank of the B.E.F. and speeded up the decision to evacuate all of the Flanders force.

Resistance was continued on the Lys-Cassel front until June 1, while troops and equipment poured into Dunkirk. Though units of the 1st and 7th French armies and of the B.E.F. were captured (German estimates at 85,000) in rearguard actions, 335,000 men were successfully withdrawn from Dunkirk by June 5. The French Navy employed over 200 vessels of all types in this strange operation, and the British Navy used 220 war vessels and 650 other small craft. Fortunately for the French and British a slight haze hindered German aviators and the weather remained calm. Due perhaps to the concentration of German aircraft in the Somme area to guard against possible French counter attack, and to the German plans for an attack on the Somme front which were laid for June 6, the German Luftwaffe could not successfully dispute the local mastery of the air over Dunkirk which was maintained during the evacuation by the R.A.F.

Though the evacuation of Dunkirk under German artillery fire and air attack will rank among the great feats of military history, the successful removal of 335,000 men from the Flanders trap could not conceal the fact that by June 5 the Allied cause had suffered a disaster of first magnitude. The evacuating armies had been forced to abandon all their military equipment except rifles and light machine guns. The amount of military equipment which fell into German hands cannot be estimated, but it comprised the very best tanks, trucks, artillery, and ammunition of 30 first line divisions. By June 5 the Germans had also taken over all the military equipment of the Dutch and Belgian armies. The British and French troops rescued from Dunkirk could not be equipped for many months even if their morale was equal to an early resumption of combat duty.

Thus, in 25 days the German operations in the west had cut down the total Allied forces by 14 Dutch, 16 Belgian, and 30 French and British divisions. The military destruction of these 60 divisions enabled the German high command to throw 150-200 divisions (minus casualties) against approximately 95 French and one British division in

the battle of France. The numerical advantage gained by the Flanders battle was far greater than the mere number of divisions indicates, because French morale had suffered tremendous blows, and in view of Italy's impending belligerency French divisions had to be maintained on the Italian frontier. Twenty-seven of the available French divisions were detailed for the defense of the Maginot line and were not available for the defense of the "Weygand line" hastily prepared along the Somme-Aisne front. By June 5 the final defeat of the French armies was assured even if 20 days of fighting were to follow before the surrender took place.

#### THE BATTLE OF FRANCE: JUNE 6 TO JUNE 25

**The Weygand Line.** While the battle of Flanders was drawing to its dismal conclusion, General Weygand made frantic efforts to prepare the Somme-Aisne-Maginot line for the blow he knew was coming. With the assistance of one British division he was forced to defend a long river line reaching from Montmédy to the sea. In some cases divisions were expected to cover a front of 20 miles or more. He wisely adopted the system of elastic defense in depth. Since French anti-tank guns were found to be ineffective against German tank armor, 75mm. field guns were employed in mutually supporting positions. Tanks which penetrated the front positions would find themselves facing increasing resistance as they advanced. The defensive line thus created was called the "Weygand line." Actually it was merely a series of hastily dug entrenched positions without wire or tank obstacles. The terrain along the Somme and the Aisne, however, favored the defense, and there were hopes that energetic and intelligent use of the scanty French reserves would enable Weygand to slow up if not check the coming German stroke. Preparations were made in Britain to ship the 1st Canadian division (General McNaughton) to France, but it arrived too late to be of service.

**The German Attack.** The German plan of attack called for the employment of all three German army groups in the west. In the battle of Flanders only the army groups of Bok and Rundstedt had been engaged. The southern army group of General von Leeb had merely acted as a holding force. In the operations of June 6 the northern army group (Bok) was to attack on the lower Somme and threaten Paris from the west. The central army group (Rundstedt) was to break through the Aisne front and outflank both Paris and the Maginot line. The southern army group (Leeb) was to break through the Maginot line and cut off the retreating French armies from the south. There was to be no breathing spell between the Flanders battle and the attack against France. The fact that the new offensive was staged the day after Dunkirk fell speaks well of the organization behind the German lines. In 1918 Ludendorff had been forced to pause for weeks between his great offensives.

On June 6 after severe fighting the army group of General Bok penetrated the French defensive line on the Somme between Abbeville and Amiens and drove rapidly to the Bresle river and the sea at Eu. This move cut off some 20,000 French and British soldiers who were pinned to the coast at St. Valéry and captured. On June 7 the German forces crossed the Bresle river and mechanized divisions moved rapidly toward Forges-les-Eaux which was captured on June 9. From this point they drove in a southeasterly direction toward

#### THE BATTLE OF FRANCE

Showing the positions of German and French lines at the time of the cessation of hostilities

Gisors and Beauvais. Rouen fell on June 10, the day on which Italy entered the war. The following day with the Germans some 30 miles from Paris, the government moved to Tours, and General Weygand contemplated a stand behind the Loire river. On June 13 Paris was declared an open city and on June 14 the advanced troops of General Keuchler's 18th army entered Paris unopposed.

Simultaneously with this rapid movement on the Somme front, the central German army group under General Rundstedt made a heavy attack on the French positions along the Aisne. After four days of bitter fighting the French front along the famous Chemin-des-Dames ridge was broken. Through this gap the armored divisions of Generals Guderian and Kleist raced southward with the distinct objectives of Troyes and St.-Dizier.

**Fall of Paris.** The rapid and deep penetration of these columns caused a general retirement of the whole French front. On June 13 the German forces had crossed the Marne river and threatened the capital from the east. With the fall of Paris on the following day, the armored columns of Guderian and Kleist were freed to move southward in the direction of the Swiss frontier. Since Weygand had determined upon a stand behind the Loire, French troops were withdrawn from the Maginot line for this purpose. Millions of refugees clogged the roads making troop movements difficult. Virtually unopposed the columns of Guderian and Kleist raced southward and reached the Swiss frontier near Besançon on June 17. In audacity of conception and execution this bold raid was only exceeded by the break-through to Abbeville in

May. This movement cut off the Maginot line and isolated its garrison.

**Maginot Line Shattered.** On the day that Paris fell and the French troops were recoiling from the blows of the northern and central army groups, the German southern army group of General von Leeb went into action against the Maginot line. Withdrawals of garrison troops had cut down its crews and the fortresses were able to offer only token resistance. On June 14 the army of General Witzleben broke through the Maginot line near Saarbruecken and captured Verdun on June 15. The fall of this mighty fortress and symbol of French resistance in 1916 profoundly discouraged the French nation. Farther south the forces of General Dollman broke through the Maginot line near Colmar and advanced through the Vosges mountains to make contact with the armored columns of Guderian and Kleist. These desperate reverses convinced Marshal Pétain that further resistance was useless. On June 17 he appealed to the enemy for "honorable terms."

Military operations went on during the negotiations for an armistice with French armies offering ineffective resistance. The approximate positions of the German troops on June 18 ran from Cherbourg-Rennes-Orleans-Nevers-Pontalier. When the Franco-German armistice was signed at Compiègne in the same car used in 1918 on June 22, the German armies had advanced as far as Brest-Lorient-La Roche-Vichy-Lyon-Bellegarde. Contact with the advancing Italian forces was approaching. The Franco-German armistice became operative only after the conclusion of Franco-Ital-

ian armistice terms. These were reached on June 24 and fighting ceased in France at 1:35 a.m. German summer time, June 25. The German line of occupation then ran from Rochefort-Poitiers-Chaefeau-rox-Limoges-Clermont-Ferrand-St. Etienne-Bellegarde. The German army did not stop its advance, however, until it reached the Spanish frontier on June 27. This gave it control of the coast line of Europe from North Cape to the Pyrenees.

Italian operations on the French frontier prior to the armistice had met with little success. Limited advances had been made in certain areas but no major clash of forces took place.

**German Casualties.** German official reports gave the casualties in operations from May 10 to June 25 as 27,074 officers and men killed, 18,384 missing, and 111,034 wounded. Total prisoners captured during the same period were given as 1,900,000 men. Captures of matériel included all the equipment of 55 French divisions and the guns and equipment of the Maginot forts. Figures are not available for French casualties in the period May 10 to June 25.

**Terms of Franco-German Armistice.** The first 10 articles dealt with military matters. Article 1 called for the cessation of hostilities and the surrender of all weapons in the hands of resisting troops. Article 2 provided for the German occupation of all French territory north of a line from the Spanish frontier at St. Jean-Pied-de-Port to Mont-de-Marsan to Angoulême to Loches to Vierzon to Bourges to Moulins to Paray to Châlon to Dôle to the Swiss frontier. Article 3 defined German rights within the occupied zone. Article 4 called for the demobilization of all French forces except those required to maintain order. Article 5 demanded the surrender in good condition of all military equipment in the unoccupied zone. Article 6 provided that military equipment not required for the preservation of order should be stored in German hands and forbade the manufacture of military equipment in unoccupied France. Article 7 called for the surrender in an undamaged condition of land and coastal fortifications in the occupied zone. Article 8 provided for the demobilization in specified ports of the French navy under German and Italian control excepting certain units for the protection of the French colonial empire. The German Government solemnly declared its intention not to employ French naval units thus surrendered for war purposes except units necessary for guarding the coasts and sweeping mines. The German Government further expressly declared that no further demands respecting the French fleet would be made at the conclusion of a peace. Article 9 demanded that the location of all French mines be given and required French aid in sweeping them up. Article 10 required a pledge of the French Government to forbid any armed forces from undertaking resistance to Germany in any manner. French citizens and members of the armed forces were to be prevented from leaving France to fight against Germany and Italy.

Articles 11 to 21 dealt with matters of transport, shipping, radio, air service, prisoners of war, and the cost of occupation by German troops. These articles placed French shipping under German control, placed a German censorship on all radio communications, demanded the repair and maintenance of harbors, industrial facilities, and railways in the occupied zone by the French Government. The French Government was called upon to facilitate the transit of freight from Germany to Italy

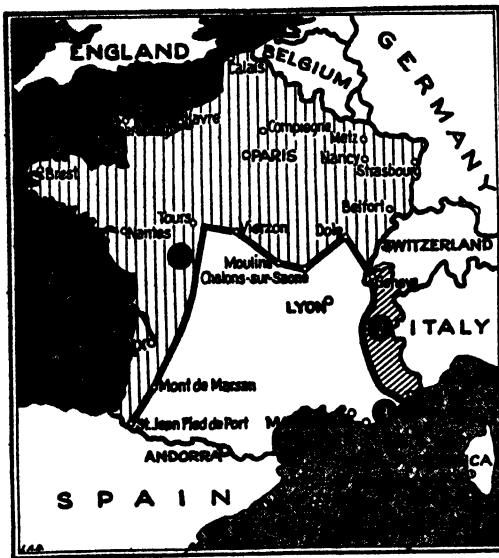

through the unoccupied zone. There was to be no transfer of economic valuables from the unoccupied zone abroad or from the occupied zone to the unoccupied zone. The French Government was to pay the costs of German occupation. All German prisoners of war in French hands were to be released. French prisoners in German hands were to be held until the conclusion of a formal peace. Articles 21-24 provided French responsibilities for the observation of terms, set up an Armistice Commission to deal with questions arising, and provided for penalties in case of French failure to fulfill obligations.

**Franco-Italian Armistice Terms.** The first six articles of the armistice dealt with military and naval terms. Article 1 called for the cessation of all hostilities. Article 2 provided that the Italian forces would maintain the line occupied at the moment hostilities ceased. Article 3 set up a demilitarized zone to be drawn 50 kilometers in advance of the Italian lines in Metropolitan France. The Tunisian-Libyan frontier was to be demilitarized. In Algeria and in French African territories south of Algeria bordering on Libya a demilitarized zone 200 kilometers wide was to be maintained until the conclusion of peace. Italy was to receive full rights to use the port of Djibouti in French Somaliland and the French section of the Djibouti-Addis Ababa railway. The coast of French Somaliland was to be demilitarized. All demilitarized zones were to be evacuated by French troops within 10 days. For the duration of the Italian war against Britain the fortified areas and naval bases of Toulon, Bizerta, Ajaccio, and Oran were to be demilitarized. The remaining articles of the Franco-Italian armistice conformed to articles 4-24 of the Franco-German armistice.

#### EFFECTS OF THE FALL OF FRANCE

The most important immediate effect of the fall of France was that it brought Italy into the war. The Italian half of the Axis did not join in the military effort of the "new order in Europe" until the defeat of France had been assured by German action. Her belligerency was, therefore, only important in terms of the war against Britain. From a purely military standpoint the resources she threw into the balance were considerable. The Italian army (Marshal Pietro Badoglio, chief of staff) consisted of 54 infantry divisions, 3 mechanized divisions, 2 motorized divisions, 3 *celere* (speed) divisions, and 5 divisions of Alpine troops. The Italian divisions were smaller in size than most European divisions which made for easy handling. Many units of the armed forces had seen active service in Ethiopia and Spain. The Italian air force was estimated at 3000 first line planes. Her navy made a welcome addition to Axis sea power in the war against Britain. The fleet was made up of 6 battleships, 7 heavy cruisers, 15 light cruisers, 62 fast destroyers, 90 modern submarines, and many fast torpedo-carrying motor boats.

The addition of Italian sea power to the Axis and the occupation of the whole coast of Europe from Norway to the Pyrenees by the Germans multiplied British naval problems. In view of the greatly extended tasks of the British fleet, the ultimate disposition of the French fleet became a matter of vital concern. If Germany, contrary to her armistice promises, employed the surrendered French vessels against Britain, Axis sea power would clearly threaten the British naval position. Certain French naval forces had taken refuge in

#### TERRITORIAL TERMS OF FRANCO-GERMAN AND FRANCO-ITALIAN ARMISTICES

Showing the area in France occupied by German troops (1); the demilitarized zone along the Italian frontier, extending 50 kilometers beyond the Italians' most advanced line (2); French naval bases at Toulon in France (3), Ajaccio in Corsica (4), Bizerte in Tunisia, and Oran in Algeria that were demilitarized by the Italo-French treaty; French Somaliland (5), where the coast was demilitarized and Italy obtained full rights to use the port of Jibuti (Djibouti) and the railway to Addis Ababa, capital of conquered Ethiopia; the Tunisian-Libyan border, where France was obliged to demilitarize strong frontier fortifications; and the demilitarized zone (shaded area) 200 kilometers wide along the remainder of the Libyan-French African frontiers

British ports. These were quietly taken over by the British on July 1. Other units were interned by vote of the crews at Alexandria. A considerable force of heavy ships had fled to Oran in Algeria. These vessels included the battleship *Bretagne* (22,189 tons), the battle cruisers *Dunkerque* (26,000 tons), *Provence* (26,000 tons), and the *Strasbourg* (26,500 tons), the airplane tender *Commandant Teste*, light cruisers and destroyers. The unfinished battleship *Richelieu* (30,000 tons) took refuge in Dakar, Senegal.

**Battle of Oran.** These heavy naval units had to be prevented from falling into Axis hands. Ac-

cordingly on July 3, the British fleet based on Gibraltar (Vice Admiral Sir James F. Somerville) consisting of 3 battleships, 1 aircraft carrier, 3 cruisers, and destroyers served a six-hour ultimatum on the French commander, Vice Admiral Marcel Gensoul. The ultimatum demanded (a) that the French fleet at Oran join the British or be interned in British ports, (b) that the French vessels be interned in American ports, (c) or that the vessels be scuttled by their crews. Failing the acceptance of any of these alternatives, the vessels would be destroyed by British action.

Admiral Gensoul allowed the time allotted to

VICTORIOUS GERMANS PARADE THROUGH THE ARC DE TRIOMPHE IN PARIS]

expire without either replying to the British demands or preparing his vessels for action. When the dead-line arrived and no response had been made to British demands, flights of bombers from the carrier *Ark Royal* sowed magnetic mines across the entrance to the harbor and the guns of the British fleet opened fire at long range on the French ships at anchor. In a three-hour action the *Bretagne*, *Provence*, and *Commandant Teste* were sunk and the *Dunkerque* was driven ashore badly damaged. The *Strasbourg* with a few light cruisers and destroyers escaped under a smoke screen to the safety of Toulon. On the night of July 8 the French battleship *Richelieu* was severely damaged in the harbor at Dakar by a British motor launch which exploded several depth charges under its stern.

These sad actions between former allies accounted for all the heavy units of the French fleet except the *Strasbourg* and the unfinished battleship *Jean Bart*, which had been towed to Casablanca. French naval units in the West Indies (the aircraft carrier *Béarn*, the cruiser *Emile Bertin*, the training ship *Jeanne d'Arc*, 2 light cruisers, and 4 destroyers) were watched by British patrols but made no effort to leave their bases. The immediate danger that French sea power would be employed against Britain was removed, although the "massacre" at Oran in which 1000 French sailors lost their lives increased French ill feeling against Britain.

**Attack on Dakar.** Many Frenchmen who did not support the pro-Axis policy of the Vichy Government and escaped to Britain, joined the Free French forces of Gen. Charles de Gaulle, who had opposed the surrender. He now attempted to utilize the French colonies in the war against Germany and Italy. On September 23, supported by 2 British battleships, 4 cruisers, and 6 destroyers, General de Gaulle attempted to take Dakar, the chief French base in Senegal. Gov. Gen. Pierre Boisson resisted and successive attempts to land troops of the Free French army at Dakar and Rufisque failed. French air squadrons based in Morocco raided Gibraltar in retaliation on September 24.

For a time the fate and loyalty of the French troops in Morocco, Algeria, Tunisia, and Syria (q.v.) remained in doubt as the Vichy Government attempted to maintain the torturous policy of defending the colonies and joining the new order in Europe. In view of the publicly announced partition aims of the Axis calling for the division of Africa into Italian and German spheres, this policy became increasingly unrealistic. French Equatorial Africa (q.v.) went over to General de Gaulle, and his forces occupied Duala, capital of the Cameroons (q.v.) on October 10, and Libreville in Gabon on November 11. The future status of African colonies became uncertain. Late in December rival forces were gathering themselves for a decisive struggle for the control of French Africa. See FRANCE under *History*.

#### THE BATTLE OF BRITAIN

The fall of France found Britain in an extremely vulnerable position. Her expeditionary force of 10 divisions had been destroyed as a military force through loss of all their heavy equipment. It would require many months before these troops could be fitted to meet the enemy in combat. Although German military writers had concerned themselves with the possibility of an invasion of Britain, no responsible British official held this to be possible

before the collapse of France. With the entire coast of Europe in German hands and with German shipping losses more than made good through capture of shipping in Norway, Holland, Belgium, and France, the invasion of Britain loomed as inevitable in July. Herr Hitler promised the German people that he would destroy the British and conquer the islands.

In the face of this threat Britain turned itself into a fortress between the fall of France and September. Beaches, roads, bridges, airfields, harbors, and public utilities were guarded. American shipments of surplus World War equipment (900,000 Enfield rifles, 83,000 machine guns, 2200 75mm. field guns, and other items) enabled the rapid re-arming of British troops. A vast army of citizen soldiers was formed into a Home Guard. Aircraft production was placed in the hands of Lord Beaverbrook and reached new levels. Under the inspiring leadership of Prime Minister Churchill, British morale rose. By September the defenses of the islands were so far advanced that responsible ministers welcomed a German invasion attempt.

From the standpoint of land operations the fall of France left Germany and Italy in an unassailable position on the continent of Europe. Not since the days of Napoleon had such crushing military power been concentrated in the hands of a few men. With military and national morale high in Germany after the defeats of Poland, Norway, Holland, Belgium, and France, there seemed no possibility of early internal collapse. The military conquests and subsequent diplomatic victories reduced the effects of the British blockade on Germany. Requisitions enforced with an iron hand on the conquered territories augmented German reserves of food and raw materials. Germany and Italy could dispose of 200-250 divisions of well-equipped troops and enjoyed a three to one advantage over Britain in airpower. Only in the realm of sea power were they at a disadvantage.

From June 25 to late in August the German army in France was busy in preparing advance bases for the war against Britain. The German Luftwaffe moved up to occupy airfields which formerly housed the French air force and R.A.F. Guns from the Maginot line and French naval arsenals were mounted along the French coast. By September 1 these preliminary steps had been taken and the stage was set for the battle against Britain.

As if timed with an eye for maximum effect in encouraging Britain, the President of the United States on September 3 announced the trade of 50 over-age American destroyers to Britain in return for use of British Atlantic bases. These ships were of World War vintage but had been completely reconditioned. They lacked modern anti-aircraft armament but were capable of undertaking convoy duties. Their acquisition relieved other more modern British destroyers for service in the Mediterranean.

**The Air War.** From September, 1939, to May 10, 1940, with the exception of the German bombing attacks on Warsaw, the air fleets of the belligerents concentrated on purely military targets. Until the outbreak of the German offensive in the west, the rival air forces had contented themselves with reconnaissance flights over enemy territory. But on May 14 the German Luftwaffe made a savage attack on the civilian areas of Rotterdam. On June 4 Paris was raided with a force of 200 bombers. These steps presaged the coming of unlimited air war.

Before the German army could successfully cross the 20-mile reach of the Strait of Dover the country would have to be softened by air attack. In all operations of the war the German air force had played an extremely important role. With large numbers of planes available and command concentrated in one person, the Luftwaffe was always able to outnumber the enemy in Poland, Norway, Holland, Belgium, and France. Its employment in German hands had been energetic and resourceful. As if to emphasize the importance attached to the role of the Luftwaffe in the defeat of France, Hitler raised Gen. Erhard Milch, and Air Fleet Commanders Sperrle, Kesselring, and Jeschonnek to the rank of Marshal. Field Marshal Goering, the creator of the Luftwaffe, was made "Marshal of the Reich" and decorated with the "Grand Cross

of the Iron Cross." Though the exact number of planes in the Luftwaffe was unknown, it was thought that the five fighting fleets contained 5000 first line fighters and 5000 bombers.

In addition to its superior numbers, clear cut doctrines of war, and energetic leaders, the Luftwaffe possessed other notable advantages over the R.A.F. Its planes were of a standard type. There were only three makes of bombers: the Junkers, the Heinkel, and the Dornier. The Messerschmitt pursuit ship was made in two types. The ships were fast, well-made, and contrary to common reports were fully equipped with instruments. Messerschmitt fighters carried one cannon in addition to multiple machine guns. The R.A.F. was forced to service many types of planes ranging from the heavy Wellington bomber, the Hampden bomber,

the Blenheim light bomber, the American built Lockheed-Hudson bombers, Spitfire, Hurricane, Curtiss P-40, and Defiant pursuit ships. With the release of additional American models, they also had to service Boeing (B-17C's), four-engine bombers (flying fortresses), and four-engine Consolidated (B-24) bombers.

The R.A.F. also was forced by the course of developments in the air war to abandon much of its pre-war doctrine. British bombers were provided with power-driven rear gun turrets on the assumption that they would be able to defend themselves against fighter aircraft in daylight operations. The cannon-equipped Messerschmitt fighters broke down this assumption, and after some very costly operations by large units of British bombers in May, daylight bombing was abandoned in favor of night bombing. The British pursuit ships were equipped with multiple Browning machine guns, but their armament, heavy as it seemed, had to be increased after the air war began in earnest.

The R.A.F. was divided for operation purposes into two commands, the fighter command for defensive operations and the bomber command for offensive tasks. In addition to the two commands of the R.A.F., there was also a Fleet Air Arm and an air force attached to the Coastal Command. Operations in Norway and Flanders showed that co-ordination between British land, sea, and air forces left something to be desired. The strength of the R.A.F. at the beginning of the battle of Britain was estimated at 2500 fighters and 3000 bombers.

**R.A.F. Raids on Reich.** The air war between Germany and Britain developed gradually. Throughout May, June, July, and August, raids were carried out nightly on a systematic basis against military targets in Germany by the R.A.F. In turn the German Luftwaffe began by attacking Channel shipping and ports. While the Luftwaffe was establishing its new bases in France, the R.A.F. operating from its own British bases was able to carry out impressive raids deep into German territory. Steel plants were attacked at Essen and Duisberg, power plants bombed at Dortmund and Bottrop, plane factories at Friedrichshaven, Augsburg, Munich, Hamburg, Bremen, Rostock, Dessau, Wismar, and Kassel were raided. Railway yards, canals, oil depots, barge concentrations, and invasion bases on the Channel were repeatedly visited.

These raids made it clear that it was impossible to stop night bombing attacks with existing equipment. To the accompaniment of growing German irritation, the raids were extended to Leipzig in July and to Berlin in late August. The curtain of German censorship prevented any clear picture being formed of the damage caused by these raids. In his *Sportspalast* speech of September 4 Herr Hitler described them as irritating nuisances, having nothing to do with the real business of war. If they were not stopped he threatened London with 100-fold reprisals. As if in direct reply to these threats the R.A.F. carried out its heaviest attack on Berlin on the night of September 6. The reply of the Luftwaffe was immediate. On September 7 the large scale German raids on London began.

Conveniently located air fields in Northern France enabled German fighter planes to protect bombers in their raids on Britain. During the preliminary daylight raids on shipping and harbor installations during July and August the excellent

quality of R.A.F. planes and pilots was demonstrated. Figures on plane losses released by the belligerents are almost meaningless, but competent American observers reported that German plane losses in this period were never less than three to one British plane.

**Bombing of London.** London suburbs had been visited by small units of enemy planes but no mass attacks on the center of the city took place until September 7. Throughout that day masses of German bombers protected by fighter aircraft broke through the British fighter squadrons and balloon barrage and dropped tons of bombs on the city. Fires swept buildings, docks, warehouses, department stores, and apartment houses. Gas mains were broken in some sections, and subways were out of commission for several days in certain areas. Buildings of historical importance such as Buckingham Palace and St. Paul's cathedral were damaged as the raids continued day after day.

Because of the unexpected intensity and duration of the first day's attack the casualty list was heavy. Between 600 and 1000 persons were killed. Delayed action and incendiary bombs increased the terror and hazards of the raid. London's civilian Air Raid Precaution system worked well and volunteer firemen fought valiantly to check the spread of fires, but the system of under-ground shelters was soon demonstrated to be inadequate to the prolonged bombardment. Subway shelters and bomb-proof dugouts were not designed to sleep London's vast population. Soon from 25,000 to 30,000 civilians were homeless and had to be given temporary shelter. Despite the vigorous anti-aircraft fire and the efforts of British fighter planes the raids continued day after day. Herr Hitler's promise that London would receive 100 bombs for every one dropped on Berlin seemed more than fulfilled.

**Plane Losses and Casualties.** Mass raids of bombers by daylight, however, proved to be too costly. The incomplete official British list of German and British planes lost, as shown on page 235, makes it clear that the Luftwaffe paid heavily for the damage inflicted.

**German Tactics Changed.** Gradually the Luftwaffe abandoned the program of day bombing except by fast fighter planes equipped with bomb racks. The heavy bombers limited their visits in masses to nights. The leading bombers lighted the target by incendiary bombs and the main body of bombers carried on with high explosives. German plane losses fell off immediately, but the effectiveness of the attack necessarily carried on from a great altitude was also diminished. Prime Minister Churchill estimated that the German air force was able to average 400 bombers a day (or night) over London from September 7 to October 7. They dropped an estimated 5,000,000 lb. of bombs which killed 6954 civilians and wounded 10,000 others. Counter raids of the R.A.F. on Berlin during the same period killed 72 persons.

Nightly raids continued on London until November 15 with only a few night's respite due to unfavorable flying conditions at the German air fields in France. These raids and those of the R.A.F. on German targets proved conclusively that bombers operating at night could not be repelled with the existing military equipment.

The nightly German raids on London did not break the morale of Londoners. After two months of bombing the vast city was still carrying on, although its port facilities had been seriously damaged. The very size of London made the damage seem less. Prime Minister Churchill asserted that it would require 10 years to destroy London at the rate of destruction in September.

On November 15, after concentrating its main attack on London for two months, the Luftwaffe suddenly changed its program of attack on Britain. Beginning with Coventry, it concentrated the main force of its bombers on one midland industrial city after another. An eight-hour attack was carried out on Coventry on November 15 by at least 400 bombers. Whole city blocks were destroyed in the systematic rolling attack and 242 civilians were killed. Immense property damage was caused, but the military damage was minimized in British reports.

During the next week the Luftwaffe concentrated its attack on Manchester, Birmingham, Bristol, Southampton, Portsmouth, and Liverpool. Though the extent of damage was hidden by the British censors, it was officially admitted that the expansion of British war industry was retarded by the raids. On December 17 Lord Beaverbrook announced that British plane production had steadily increased throughout the period of heaviest bombing. The average British civilian casualty list for each German raid in November and December amounted to 200 killed and wounded. Only a few hundred British military casualties resulted from the bombing raids from September to the end of the year. Though London enjoyed a respite from attack while the midland cities were suffering, the German bombers came back to the capital city frequently enough to prevent the dispersion of anti-aircraft batteries to other areas.

As the German bombing attacks continued in November, the President of the United States announced that half of the American production of war planes would be diverted to Britain. In De-

cember all the production of Curtiss P-40 fighters (seven a day) went directly to Britain. On November 20 an exchange of 20 new Consolidated (B-24) four-engine bombers and 26 Boeing (B-17C's) four-engine bombers (flying fortresses) for British aircraft engines was announced. These bombers were to be equipped with the Sperry bombsight held to be slightly inferior to the standard American (Norden) bombsight. American officers were to observe the performance of this equipment under war conditions. A trend toward standardization of British and American war planes became apparent when Air Marshal Sir Hugh Dowding (former chief of the Fighter Command, R.A.F.) was appointed on November 17 to head a mission of standardization to the United States.

A shakeup in the command of the R.A.F. resulted from the German raids of September and October. Air Marshal Sir Charles Portal replaced Sir Cyril Newall as commander-in-chief on October 4. Air Marshal Sir William Sholto Douglas replaced Sir Hugh Dowding as chief of the Fighter Command on November 17. At the same time a new command, the Army Co-operation Force, was created under Air Marshal Sir Arthur Sheridan Barratt.

British raids against German and Italian industrial areas and against the invasion bases were carried out whenever weather conditions permitted. Though the bomb load of British planes was reduced by the distance traveled before reaching their objectives, the methodical character of their attacks was counted upon to increase the damage wrought. Certain industrial targets in the Ruhr were bombed more than 200 times. Hamburg came in for repeated heavy attacks. Berlin was raided for the 37th time on December 21, but William L. Shirer, representative of the Columbia Broadcasting Company, reporting in the United States on December 23 after two years in the German capital, stated that damage throughout Berlin was scattered but relatively unimportant. Civilian morale was not shaken in Berlin, but the evacuation of children from Hamburg and Berlin began as early as November.

**British Land Defenses.** Spectacular and damaging as the air raids were, it was apparent that neither Germany nor Britain could be defeated by the air arm alone. With the continent of Europe from the arctic capes of Norway to the Pyrenees in the possession of an all-victorious German army, Britain could not hope to intervene on the continent in a military way before 1942. Her first concern was to prepare for a possible German invasion.

Feverish defense efforts followed the evacuation of Dunkirk and the fall of France. The divisions withdrawn from Flanders were rapidly re-armed and reconstituted. On July 19 the command of the Home Forces was given to Gen. Sir Alan Brooke who had distinguished himself in the fighting in Flanders. A defense zone 20 miles deep was constructed along the coasts of Britain with pill boxes, artillery emplacements, land mines, tank traps, and barbed wire entanglements. Roads, bridges, beaches, and other strategic points were prepared for defense. Air ports and open fields were protected against surprise landings of enemy aircraft. A vast Home Guard force of volunteers which rose to over a million men by mid-summer was available for the defense of local areas. These civilian soldiers were trained in the rough-and-ready technique of killing by British non-professional sol-

diers such as Capt. Thomas H. Wintringham and others.

By the end of September the British army rose to over 1,500,000 men. As mechanized equipment became available, these troops were trained in the German style of *blitzkrieg* warfare. In November large scale maneuvers were held with mechanized, motorized, and infantry divisions participating with aircraft units operating under war conditions. With the morale of its armed forces at a high peak, Britain waited for the German invasion.

As summer passed to fall and winter without evidences of a German invasion effort, Britain continued her bombing raids against possible invasion bases in the Low Countries and occupied France. German diplomatic efforts in the fall and winter, which brought new members into the Axis (Japan, Hungary, Rumania, and Slovakia), seemed to indicate an effort to line up the continent of Europe against Britain and prevent American aid through threats of Japanese involvement in a war against the United States. Many critics felt that if German diplomatic efforts were successful in consolidating the new order in Europe, Britain might be convinced of the futility of attempting to conquer Germany. The Axis diplomatic offensive was accompanied by a vigorous attack on British shipping and port facilities by submarines and aircraft. British shipping losses soon mounted to new highs for the war.

**Merchant Shipping Losses.** The occupation of Norwegian, Dutch, Belgian, and French ports by the Germans added immensely to the work of the British navy. As long as German submarines had to operate from German bases, they could be checked, but when the Germans began to use Boulogne, Cherbourg, Brest, Lorient, and St. Nazaire as bases for U-boat raids against Atlantic convoys, it became difficult to protect British shipping. German long range bombers operating from the peninsula of Brittany were able to spot for German submarines.

During the First World War Britain not only had the aid of American, French, and Italian patrol craft in combatting the submarine, but was also able to use Irish bases. The Irish Government declined to permit the use of her ports and British patrol craft had to use British west coast bases. When Italy joined the Axis 90 modern submarines were made available for the war against British

shipping. From June to November, British and Allied shipping losses averaged 60,000 tons a week. The shipping losses when added to the destruction caused by bombing raids gave cause for concern whether Britain would be able to carry on the war without ships from the United States. During the last week in November the rate of sinking rose to 87,000 tons. For the week ending December 8 losses stood at 101,000 tons. They fell to 40,000 tons for the week ending December 15, and they remained at approximately that figure for the remainder of the month.

Taking advantage of the long winter nights German surface raiders broke into the Atlantic and made attacks on British convoys in November and December. The British armed merchantman *Servis Bay* sacrificed itself on November 5 to protect its convoy from the attack of what was thought to be the German pocket battleship *Lützow*. On December 5 the armed merchantman *Carnarvon Castle* fought an indecisive engagement with a German surface raider in the South Atlantic. The combined air, surface, and submarine attack on British shipping was regarded as more dangerous than the bombing attacks since it menaced Britain's Atlantic life line.

#### CAMPAIGNS IN AFRICA

The Franco-Italian armistice allowed Italy to concentrate her major forces against the British colonies in Africa and against the outposts of her imperial life line, Gibraltar and Suez. British plans for war in the Mediterranean area were made upon the assumption that the French army in Syria could be counted on to safeguard Allied interests in the Middle East. The British Middle Eastern Command (Gen. Sir Archibald Wavell) maintained a force of 150,000 troops in Palestine and Egypt.

#### ITALO-BRITISH FRONTS IN AFRICA

Showing French Somaliland (1), used by the Italians after France's collapse as a base for their conquest of British Somaliland (2); the key positions in Kenya and the Anglo-Egyptian Sudan adjoining Italian East Africa, and the main positions in the northern zone of hostilities along the Egyptian-Libyan border

Reinforcements were received in the course of the war from Australia and New Zealand. British communications depended upon the Gibraltar fleet (Vice Admiral Sir James Somerville) and the Eastern Mediterranean fleet based on Alexandria (Admiral Sir Andrew Cunningham). The combined capital ships in both British fleets equalled Italy's total of capital ships, but the more lightly armored Italian ships of the line were held by experts to be inferior in fighting power and resistance to the slower but more heavily armored British ships. Italian air superiority in the Mediterranean was roughly two to one in numbers, but she possessed no aircraft carriers. British superiority in this weapon soon became apparent.

The colonies of Libya and Italian East Africa provided bases for Italian operations against Egypt, Anglo-Egyptian Sudan, Kenya, and British Somaliland, but their communications depended upon the ability of the Italian fleet to control the sea route to Italy. Marshal Rodolfo Graziani commanded the army in Libya estimated at 250,000 white and native troops. The Duke of Aosta (Prince Amadeo of Savoy, Viceroy of Ethiopia) commanded the East African Italian forces consisting of one white division (The Savoy Grenadiers—21,391 men) and 50,000 native troops.

**Sudan-Kenya Fronts.** Indecisive fighting broke out on the frontiers of Kenya (q.v.) and the Anglo-Egyptian Sudan (q.v.) in July. Kassala and Gallabat in the Sudan were captured by the Italians on July 5, but changed hands many times in the months following. An Italian advance from Ethiopia and Italian Somaliland into Kenya penetrated as far as Moyale in July, but British reinforcements from South Africa later drove the invaders out. Neither side had sufficient forces to gain a decision in these areas where distances were great and strategic points limited. The Italian East African forces were obviously being concentrated for the invasion of British Somaliland.

**Italians Occupy British Somaliland.** In August the Duke of Aosta at the head of 70,000 white and native troops invaded British Somaliland from three sides. British pre-war plans for the security of British Somaliland had been based on the joint resources of French and British Somaliland. The fall of France rendered British Somaliland untenable. Defense forces in this isolated colony consisted of the Somaliland Camel Corps (Lieut. Col. Arthur R. Chater) of 560 men plus 500 native police. On August 5 the Italian forces advanced in three columns against Berbera. In the face of overwhelming numbers the British had no choice but to evacuate the colony. All British troops were withdrawn to Aden on August 19 and the Italian occupation became complete. See SOMALILAND, BRITISH.

**Offensive Against Egypt.** The Italian advance against Egypt came on September 12 when the army of Marshal Graziani moved from the Libyan bases of Bardia and Fort Capuzzo along the coastal road to Solum. Mechanized units protected by planes swept forward 55 miles in five days capturing Solum and Sidi Barrani. The main British forces retired to Matruh, which enjoyed rail communications with Alexandria. After the quick rush to Sidi Barrani the Italian force spent nearly three months improving the base facilities and water supply at that town. The invading force, whose ultimate objective was Alexandria, operated under the disadvantage of having to advance along the coast within range of British naval guns. The Italian

#### THE EGYPTIAN BATTLEFIELD

The Italians advanced beyond Sidi Barrani in September and were driven out of Egypt by the British counteroffensive in December. The key positions and the dates of their capture by the British are shown on the map.

delay at Sidi Barrani allowed Marshal Graziani's engineers to begin the construction of a second road to Libya thirty miles inland beyond the range of British naval guns.

From September, 1939, to December, 1940, the main British forces in Egypt engaged in no important military operations. General Wavell was therefore able to give his troops long months of training in desert warfare. Reinforcements of Australian and New Zealand troops brought General Wavell's forces to about 200,000 troops by December. Increased output of fighting planes enabled Britain to send a number of first-class fighting and bombing squadrons to the Middle East. After Admiral Cunningham's fleet had struck the Italian navy a crippling blow at Taranto on November 11-12, and when unexpected Greek successes turned the Albanian campaign into an Italian defeat, General Wavell's forces were prepared to take advantage of the isolation of Marshal Graziani's forces.

#### NAVAL ACTIONS IN THE MEDITERRANEAN

Since the victory of the British army of the Nile in December depended to a great extent on the question of the control of the sea, it is necessary to provide an account of the struggle between the British and Italian fleets. The Italian navy was composed largely of lightly armored fast modern warships. Her naval history in modern times had not included a battle against enemy ships of the line. Her most successful naval operations in the First World War consisted of surprise attacks by light torpedo-carrying motor boats. Of her six battleships, two were new ships of the *Littorio* class (35,000 tons) and four were older ships of the *Cavour* class (26,000 tons) which had recently been modernized. Her submarine fleet (90 modern vessels) was one of the largest in the world. Admiral Domenico Cavagnari was chief of staff of the navy.

Despite her central position in the Mediterranean and the possibilities of throwing all her forces against the widely separated British fleets, the Ital-

ian battle fleet did not seek out a decisive engagement. British naval units steamed thousands of miles in an effort to draw out the enemy, but no fleet action ensued. A short engagement between light forces took place off the coast of Crete on July 19 when the Australian cruiser *Sydney* sank the fast Italian cruiser *Bartolomeo Colleoni*. On October 13 the British cruisers *Ajax* and *York* sank the Italian destroyer leader *Arighiere*. Damage was inflicted on two other Italian destroyers in this engagement. The British destroyer *Kimberley* sank the Italian destroyer *Francesco Nullo*. Bombing attacks and counter raids on bases and oil depots characterized this indecisive stage of the naval war.

In November the British fleet undertook a vigorous offensive program in the Mediterranean. With the Italian army bogged down in Albania, the Eastern Mediterranean fleet made a raid in force against Italian communications in the Straits of Otranto. On November 11 three Italian supply ships were sunk and a destroyer badly damaged. Since the main Italian fleet at Taranto made no effort to repel this invasion of Italian waters, the British fleet appeared off the naval base of Taranto on the night of November 11-12, and subjected the Italian fleet to a heavy attack. Admiral Cunningham's confidence in the British fleet was so great that he carried newspaper observers with him.

The harbor installations at Taranto lent themselves to the British plan of attack. The harbor is practically land-locked and the fire of British heavy ships would have made the escape of Italian ships difficult if not impossible. Thus pinned down to the crowded harbor, the Italian ships were excellent targets for the attack of flights of torpedo planes from the aircraft carriers *Eagle* and *Illustrious*. Throughout the night repeated attacks were carried out against the anchored ships in the harbor. One Italian battleship of the *Littorio* class was hit and severely damaged. Two Italian battleships of the *Cavour* class were beached in order to prevent sinking. Other light war craft were hit and damaged and the bridge over the inner harbor was wrecked. At dawn the British fleet maintained its position off Taranto but the battered Italian fleet made no effort to leave its harbor. British bombing attacks on the following day added to the destruction. Italian communiqués issued the following day admitted severe damage to one battleship, but afterward the British Admiralty published aerial photographs showing damage to three capital ships. Mussolini admitted in his speech of November 18 that three battleships had been severely damaged in the Taranto raid.

This brilliant fleet action demonstrated the effectiveness of carrier-based aircraft and reduced the Italian capital ships to three. Since no security against British attack could be found at Taranto, the Italian fleet was forced to seek shelter on the western coast of Italy. This left Marshal Graziani's army in Libya cut off from its Italian bases and endangered the supply routes of the army in Albania.

The movement of the Italian fleet to western bases was detected by the British Gibraltar fleet. An indecisive engagement took place west of Sardinia on November 27 when an Italian force consisting of capital ships and cruisers fled to the protection of coastal batteries. Both sides claimed hits on enemy heavy units. The British admitted slight damage to the cruiser *Berwick*, and the Italians

admitted heavy damage to the cruiser *Fiume* and the destroyer *Lanciere*. These actions seemed to confine the Italian fleet to a strictly defensive role. As if to emphasize the naval failures, Admiral Cavagnari was replaced on December 8 by Adm. Arturo Riccardi. On December 14 the Italian fleet, then anchored at Naples, was subjected to a heavy bombing attack by British planes which claimed hits on five ships. Italian communiqués admitted severe damage to one cruiser and 59 naval casualties.

Control of the eastern Mediterranean passed into British hands as a consequence of these engagements. The British fleet was able to support General Wavell's push into Libya by action against Italian roads and bases. On December 18 British naval units swept into the Adriatic Sea and bombarded Valona and Durazzo without encountering enemy naval resistance.

#### BRITISH VICTORIES IN AFRICA: DECEMBER 7-31

Taking advantage of Italian defeats in Albania and the isolation of Marshal Graziani's army through naval action, General Wavell struck the Italian advance forces at Sidi Barrani and Maktila on December 7. The brilliant action which followed made full use of British naval, land, and air power. A striking force of British and Imperial troops numbering about 40,000 had been admirably trained in desert fighting. They were well equipped with tanks, tractors, and armored cars. The R.A.F. under Air Marshal Sir Arthur Longmore had received reinforcements of new Spitfire and Hurricane fighters. They led the attack on Italian airfields and bases in *blitzkrieg* style and paralyzed the Italian air force. Gen. Sir Henry Maitland Wilson commanded the British striking force. A daring plan for encircling the Italian advance forces was drawn up by General Wavell. It called for a carefully co-ordinated surprise move by all arms beginning at dawn on December 7.

Operating from their base at Matruh, British troops faked a frontal attack on Maktila and Sidi Barrani, while tanks and armored cars moved through the desert to cut the Libyan communications of Sidi Barrani and attack it from three sides. Surprise was complete. Italian units were over-run by tanks and armored cars while at breakfast. Where Italian resistance was heavy so were Italian losses; British advance forces were soon embarrassed by the number of prisoners taken. A British armored column reached the sea at Bagbag on December 7 and isolated the garrison at Sidi Barrani. Nearly 30,000 white and native troops, the greater part of three divisions, fell prisoner. The Italian troops, retreating along the coastal road into the Solum bottle-neck, were pounded by naval guns and bombs. Vast quantities of equipment were abandoned. Within 10 days Egypt had been evacuated and on December 16 the British forces captured Solum and Fort Capuzzo. So great was the confusion of the Italian forces that planes were captured on the ground at Fort Capuzzo. The operations from December 7 to 16 which drove the invader out of Egypt were known as the battle of Marmarica.

With the capture of Fort Capuzzo and the advance on Bardia the battle of Cyrenaica began. British mechanized units led by Gen. Michael O. Creagh swept ahead to cut off Bardia and its garrison. Some 20,000-40,000 Italian troops were soon isolated from their main forces. Favored by the presence of stone houses and caves, the encircled Italian troops in Bardia found some shelter from

British naval shells and bombs. British naval units boldly entered Bardia harbor and sank supply ships. As British reinforcements came up and the steel circle of artillery and infantry drew closer on the city little hope was held out by Italian official circles for the garrison at Bardia although orders were issued to Gen. Francesco Mario Berti for a last-stand defense. British preparations were made for a further advance into Libya as the main Italian forces retreated toward Tobruk some 70 miles from Bardia.

Within three weeks Marshal Graziani's army had lost in killed, wounded, and captives nearly one-third of its forces. Immense quantities of war material fell into British hands. Tanks, trucks, guns, and ammunition captured from the Italians promised to supply the Greek army with much-needed equipment. With very light losses General Wavell's army had captured more Italians than there were Britishers in the striking force. The British victories of December showed that the lessons of Norway and Flanders were at last being applied by the British. They demonstrated that the Italian army in Africa was weaker than widely believed. Italian morale was distinctly lower than British, though the troops at Bardia fought stubbornly. Marshal Graziani in an unusually frank telegram to Mussolini on December 22 attributed the Italian disaster at Sidi Barrani to shortages of modern tanks and planes. With little prospect of receiving reinforcements in these weapons from Italy, the fate of Graziani's main forces in Libya seemed clear. Libyan tribesmen and Ethiopian warriors made ready to exploit the Italian disasters in north Africa. By the end of the year Britain's life line seemed securely anchored in the Middle East.

#### THE ITALO-GREEK WAR

After the collapse of France, Axis diplomacy was active in the Balkans. On September 27 Japan joined the German-Italian military alliance. Nazi diplomatic pressure on Rumania (q.v.) followed the partition of that country by Russia, Hungary, and Bulgaria. On October 8 German troops were "invited" to occupy certain areas in Rumania and "instruct" the Rumanian army. Prime Minister Antonescu brought Rumania into the Axis after a bloody coup d'état by the pro-Nazi Iron Guard. Hungary and Slovakia followed Rumania into the Axis camp. These steps indicated diplomatic preparations for a possible Axis stroke in the middle east. The peaceful penetration of the Balkans seemed in line with Germany's policy of keeping the Balkans at peace in order to exploit its economic resources to the full. The peace which had survived many Balkan crises was broken on October 28 by the Italian invasion of Greece.

**Italian Ultimatum.** Italian-Greek relations had been strained since Aug. 14, 1940, when what was unmistakably an Italian submarine deliberately sank the Greek minelayer *Helle* in a Greek harbor. There were frequent threats in Italian newspapers against the use of Greek bases by the British. Taking advantage of a "frontier incident" alleged to have occurred on October 26, the Italian government issued a three-hour ultimatum to Greece at 3 a.m. on October 28.

The ultimatum was similar in form and content to the German demands on Holland, Belgium, Norway, and Denmark. It accused the Greek government of allowing British use of Greek bases and demanded the surrender of strategic areas as tokens of future good behavior. Before the govern-

ment of Premier John Metaxas had time to reply, Italian troops moved into Greek territory at 5:30 a.m. on the morning of October 28. Although Fascist circles had hoped for an easy victory and the rise of a fifth column within pro-Axis circles in Greece, a united nation and a surprisingly strong army rallied behind Metaxas. See GREECE under *History*.

**The Opposing Forces.** On paper the odds against the Greeks seemed as desperate as those against the Finns just a year before. The Greek army was composed of 13 infantry divisions but only 10 of these were fully equipped. Gen. Alexander Papagos had a reserve of 600,000 troops which had been given 18 months of military training. The army possessed no modern mechanized equipment and very little heavy artillery. Her mountain batteries, however, were well adapted to the terrain. Greek troops had been well trained in mountain warfare and were physically tough and hardy. The air force of some 200 obsolete planes was based on two main army fields and seven auxiliary fields. If German methods had been followed this air force and its landing fields would have been destroyed on the first day of attack.

The Greek navy consisted of 1 old cruiser, 10 destroyers, 13 torpedo boats, and 6 submarines. It could not be expected to defend Greek waters against the large and modern Italian navy. Other factors seemed to be against the Greeks. The strongest part of the Metaxas line faced Bulgaria and not Albania. Her mutual assistance pacts (see BALKAN ENTENTE) did not protect her against an invasion by Italy. The Greek-Turkish pact called for Turkish aid only if Bulgaria invaded Greece. The Greek-Yugoslav pact was operative only if Turkey was also assisting Greece. The only aid available was what hard-pressed Britain could offer.

The Italian army in Albania which undertook the invasion of Greece on October 28 consisted of 10 divisions commanded by Gen. Sebastian Viscconti Prasca. The force was strong in mechanized equipment, but the Fiat light tanks were of the type found wanting in the Spanish Civil War. Labor battalions and engineers brought General Prasca's force to about 200,000 men. These forces received supplies from Italy from three main Albanian ports: Porto Edda, Valona, and Durazzo. From the coast four main supply routes followed the rivers or the coastal plain to the Greek-Albanian frontier. Advanced Italian bases were at Porto Edda, Argyrokastron and Koritsa.

**Italian Invasion Plan.** The Italian invasion was prepared by Italian air attacks on Greek cities and ports, but they lacked German thoroughness. The raids did not destroy the Greek air force nor render her airports useless. British R.A.F. planes soon appeared on the Greek front. Italy failed to gain mastery of the air at the outset and much of her later failure can be traced to this cause.

The actual invasion of Greece was carried out by five Italian columns. One force advanced from Porto Edda toward Philiates; another advanced from the same base toward Ioannina (Janina). A strong column based on Argyrokastron advanced toward Konitsa. Two columns in the north menaced Kastoria and Florina. These operations threatened, if successful, to cut the main railway communications between Athens and Salonika. The northern advance aimed at the vital port of Salonika. For three days the Italian advance continued, but Greek tactics soon brought the offensive to a halt.

#### FRENCH WARSHIP ABLAZE AND SINKING IN THE BATTLE OF ORAN BAY

**Invaders Turned Back.** Skillfully utilizing the mountain heights, Greek mountain troops with mule pack artillery allowed the Italian mechanized columns to advance up the valleys. When the columns were strung-out and vulnerable, Greek troops imitated the successful Finnish tactics of pinning them to the ground by artillery fire and closing with bombs and bayonets. There was no opportunity for the Italian mechanized equipment to operate effectively. The time chosen for the campaign and the terrain were utterly unsuited to mechanized warfare. The weather soon brought additional difficulties to the Italian high command. Heavy rains turned to snow. Italian engineer units were not equal to the task of maintaining communications, and the Italian air force, operating at great altitudes, was unable to disrupt Greek communications. General Papagos took advantage of the failure of the first Italian advance to launch a series of counter attacks which soon drove the invaders out of Greek territory.

**The Greek Offensive.** On November 9 the early Italian failures in the attack on Greece resulted in the replacement of General Prasca by Gen. Ubaldo Soddu. The former Fascist War Minister found the army in Albania bogged down on all fronts and suffering from failing morale. Koritsa, the main Italian base in northern Albania, fell into Greek hands on November 22 with many prisoners and considerable military equipment. With the fall of Koritsa the Italian northern front crumbled rapidly. Pogradec on the shores of Lake Ochrida was captured after heavy fighting on November 28. From this point the Greek advance along the Shkumbi and Devol rivers threatened the inland base of Elbasan.

Simultaneously with these operations in the north, the Greek high command launched a three-pronged attack against Porto Edda, Agyrocastron, and Tepeleni. Porto Edda fell on December 6, and Agyrocastron was taken after heavy fighting on December 9. An advance along the coastal road brought Khimara into Greek hands on December 23. The Greek offensive up the Drina and Viosa rivers met with determined resistance, but Tepeleni, the objective of the drive, was under Greek attack on December 27. Slow Greek advances continued until the year ended with more than one-fifth of Albanian territory in Greek hands.

**Italy's Critical Position.** The astonishing military reverses in Albania which came simultaneously with naval losses and with Marshal Graziani's defeat in Egypt had a profound effect on Italian morale. A drastic shakeup in Italian military and naval circles followed. On December 5 Marshal Pietro Badoglio, chief of staff and famed for his conquest of Ethiopia, who had opposed the Albanian venture, was brusquely replaced by Gen. Ugo Cavallero. Gen. Cesare de Vecchi, Governor-General of the Dodecanese Islands, was replaced by Gen. Ettore Bastico. Adm. Domenico Cavagnari was replaced by Adm. Arturo Riccardi. Ettore Mutti, the hard-bitten head of the *desperata* squadron of the Italian air force, and Achille Starace, chief of the Fascist militia, were sent to Albania to build up army morale. Fascist newspapers spoke frankly about Italy's great dangers. Prime Minister Churchill appealed to the Italian people to overthrow their leader and make peace with the British empire.

Italian failures in Albania and north Africa profoundly affected the future of the war in the Mediterranean. Crete was occupied by the British and

provided bases from which British bombers could attack southern Italy. British naval control of the eastern Mediterranean became almost absolute. Unless Axis naval or military action could reverse the situation, the Italian armies in Ethiopia and Libya seemed destined for slow strangulation by British blockade if not destroyed by military action. As the year ended German military aid seemed necessary to save Italy from further reverses even if this aid involved other Balkan countries in the war. See ITALY under *History*.

## SUMMARY FOR 1940

The military events of 1940 saw the end of the stalemate in the West. Nazi Germany over-ran Norway, Holland, Belgium, Denmark, Luxembourg, and France by a series of military operations dis-

## NAVAL LOSSES ADMITTED BY THE BRITISH, 1940

Name	Type	Gross tonnage
<i>Glorious</i> , aircraft carrier		22,500
<i>Curlew</i> , anti-aircraft cruiser		4,290
<i>Calypso</i> , anti-aircraft cruiser		4,180
<i>Effingham</i> , cruiser		6,000
<i>Scotsdown</i> , armed merchantman		17,046
<i>Andonia</i> , armed merchantman		13,950
<i>Vandyck</i> , armed merchantman		11,000
<i>Dunvegan Castle</i> , armed merchantman		15,000
<i>Carinthia</i> , armed merchantman		20,227
<i>Transylvania</i> , armed merchantman		16,923
<i>Laurentic</i> , armed merchantman		19,000
<i>Highland Patriot</i> , armed merchantman		14,000
<i>Jervis Bay</i> , armed merchantman		14,164
<i>Grenville</i> , destroyer		1,485
<i>Esmouth</i> , destroyer		1,475
<i>Daring</i> , destroyer		1,380
<i>Hunter</i> , destroyer		1,340
<i>Hardy</i> , destroyer		1,340
<i>Gloucester</i> , destroyer		1,505
<i>Ghurka</i> , destroyer		1,870
<i>Afridi</i> , destroyer		1,485
<i>Whitley</i> , destroyer		1,340
<i>Acacia</i> , destroyer		1,485
<i>Ardent</i> , destroyer		1,485
<i>Whirlwind</i> , destroyer		1,340
<i>Brasen</i> , destroyer		1,340
<i>Wren</i> , destroyer		1,485
<i>Hostile</i> , destroyer		1,340
<i>Isankoe</i> , destroyer		1,485
<i>Esh</i> , destroyer		1,485
<i>Wessex</i> , destroyer		1,100
<i>Venetta</i> , destroyer		1,340
<i>Acheron</i> , destroyer		1,350
<i>Fraser</i> , destroyer (Canadian)		1,350
12 destroyers (not listed by names)		(?)
<i>Seahorse</i> , submarine		640
<i>Undine</i> , submarine		540
<i>Starfish</i> , submarine		640
<i>Thistle</i> , submarine		1,575
<i>Salmon</i> , submarine		640
<i>Orswald</i> , submarine		1,575
<i>Seal</i> , submarine		2,500
<i>Ozley</i> , submarine		1,354
<i>Tarpon</i> , submarine		640
<i>Sterlet</i> , submarine		640
<i>Orpheus</i> , submarine		1,475
<i>Odin</i> , submarine		1,475
<i>Triad</i> , submarine		640
8 submarines (not listed by names)		(?)

## NAVAL LOSSES ADMITTED BY GERMANY, 1940

Name	Type	Gross tonnage
<i>Bluscher</i> , heavy cruiser		10,000
<i>Emden</i> , light cruiser		5,400
<i>Karlsmueller</i> , light cruiser		6,000
10 destroyers (not listed by names)		(?)
8 submarines (not listed by names)		(?)

## NAVAL LOSSES ADMITTED BY ITALY, 1940

Name	Type	Gross tonnage
<i>Barotommaso Colonna</i> , heavy cruiser		10,000
<i>Artigliere</i> , destroyer leader		1,620
<i>Francesco Nullo</i> , destroyer		1,300

tinguished for their total planning, ruthless execution, and astonishing co-ordination of all air, land, and sea forces. Britain lost four allies by military action during the year and faced the year 1941 with only the active military assistance of the Greeks. The Axis powers gained four new allies (Japan, Rumania, Hungary, and Slovakia) and dominated the continent of Europe from a military standpoint. German economic conditions, menaced by the British blockade in the first year of the war, were relieved by the conquests of 1940. The mines and factories of Europe were at the disposal of the Axis armed forces. The conquered areas of Europe might go hungry, but the Reich could not be starved into submission.

German air and submarine attacks on Britain had curtailed British supplies, but the fleet was still intact and the R.A.F. continued to grow. The ultimate survival of Britain seemed to depend on the maintenance of her great chain of naval bases and on keeping the Atlantic channels open to trade. President Roosevelt took occasion on December 29 to condemn the Axis aggressors in unmeasured terms and promised all-out aid to Britain and other victims of aggression. Herr Hitler's message of the day to his troops on New Year's Eve spoke of the final defeat of the democratic powers in 1941. With most of the world at war and with those nations still at peace frantically arming, it appeared that the war would spread to new theaters in 1941. No mere account of the military operations of the war can include an estimate of the social and political impact of the events described above on the world order. The war was more than a military contest in 1940; it was one stage of a world revolution. For the political, economic, and social repercussions of the conflict, see the separate articles on all of the belligerent and non-belligerent countries and territories of the world, especially the sections under *History*.

See AERONAUTICS, MILITARY PROGRESS; NAVAL PROGRESS; REFUGEES. For developments in treatment of the wounded, see MEDICINE AND SURGERY. For the effect of the war on other activities, see ART; BUSINESS REVIEW under *World Business Trends*; EDUCATION; INSURANCE; INTERNATIONAL BANKING AND FINANCE; LABOR CONDITIONS; LIVING COSTS AND STANDARDS; NEWSPAPERS AND MAGAZINES; PHOTOGRAPHY; articles on literature etc. See also WAR RELIEF.

**Bibliography.** Among the useful books on the war are: *I Saw It Happen in Norway*, by Carl J. Hambro (New York, 1940); *Chronology of Failure: The Last Days of the French Republic*, by Hamilton Fish Armstrong (New York, 1940); *The War: First Year*, by Edgar McInnis (New York, 1940); *I Saw France Fall: Will She Rise Again?*, by René de Chambrun (New York, 1940).

H. A. DEWEERD.

**EVANGELICAL AND REFORMED CHURCH.** The. A denomination formed by the merger in Cleveland, Ohio, on June 26, 1934, of the Evangelical Synod of North America and the Reformed Church in the United States. The former was founded in 1840, by representatives of the Evangelical Churches of Germany and Switzerland. The latter traced its origin chiefly to the German, Swiss, and French Protestants, who settled in America early in the 18th century. Both churches, in doctrine and polity, were akin to the Reformed bodies.

The highest judicatory of the Evangelical and Reformed Church is the General Synod, which meets biennially. A new Constitution was declared

in effect at the meeting of the General Synod, held at Lancaster, Pa., in 1940. The officers of the Evangelical and Reformed Church are: President, Rev. Dr. L. W. Goebel, 77 W. Washington St., Chicago, Ill.; First Vice-President, Rev. Dr. George W. Richards; Second Vice-President, Hon. D. J. Snyder; Secretary, Rev. Dr. William E. Lampe, 1505 Race St., Philadelphia, Pa.; Treasurer, Mr. F. A. Keck.

In its combined statistics for the year 1939, the Evangelical and Reformed Church reports a membership of 658,571 in 2861 congregations. Total expenditures for congregational purposes amounted to \$8,146,129, and total benevolences to \$1,378,019. The Sunday School enrollment is 522,153.

The denomination supports missionary work in six fields: Japan, China, India, Iraq, Honduras, and Africa. In the home field it supports more than 300 home mission churches and six special projects, among foreign-language groups, underprivileged, Japanese in California, and the Indians in Wisconsin. It has 13 educational institutions. The various sections of the Church support 9 hospitals, 10 orphanages, 13 old folks' homes, and 2 homes for epileptics.

The official publications of the denomination are: *The Messenger* of the Evangelical and Reformed Church, a weekly, and the *Year Book and Almanac*. The German constituency is served by *Der Friedensbote* and the *Kirchenzeitung*, both weeklies. *The Outlook of Missions* is a monthly magazine devoted to the home and foreign mission work of the Church.

**EVANGELICAL CHURCH.** A religious body organized along Methodist lines by Jacob Albright (1759-1808) in Pennsylvania. Headquarters, 1900 Superior Avenue, Cleveland, Ohio, and Harrisburg, Pa. See RELIGIOUS ORGANIZATIONS.

**EVER-NORMAL GRANARY.** See AGRICULTURAL ADJUSTMENT ADMINISTRATION.

**EXCESS PROFITS TAX.** See TAXATION.

**EXCHANGE CONTROL.** See CUSTOMS, BUREAU OF; INTERNATIONAL BANKING AND FINANCE; ARGENTINA, BOLIVIA, BRAZIL, CANADA, CHILE, COLOMBIA, IRELAND, MEXICO, NEW ZEALAND, PERU, URUGUAY, VENEZUELA, and other countries under *History*.

**EXPEDITIONS.** See EXPLORATION; POLAR RESEARCH. For expeditionary forces, see EUROPEAN WAR.

**EXPENDITURES.** See PUBLIC FINANCE; articles on all foreign countries under *Finance*. For family expenditures, see LIVING COSTS.

**EXPERIMENT AND EXTENSION WORK.** See AGRICULTURE.

**EXPLORATION.** For the account of exploration of the polar regions in 1940, see POLAR RESEARCH. Anthropological and archaeological explorations are treated in the articles on ETHNOLOGY and ARCHAEOLOGY.

**Australasia.** Dr. and Mrs. Douglas L. Oliver of Harvard's Peabody Museum, after spending nearly two years on the volcanic island of Bougainville in the Solomon Islands, returned to the United States with important geographic and other scientific data concerning that part of the world. The couple lived in a jungle inhabited by the Siwai tribe, an ancient aboriginal people who practiced head-hunting until their island was acquired by the British under mandate in 1920. Making their headquarters 30 miles in the interior, and therefore at a point totally unaffected by white civilization, Dr. and Mrs. Peabody mastered the language

of the inhabitants and acquired valuable information concerning them and their surroundings.

**North America.** The American Museum of Natural History and the National Geographic Society each sent expeditions to collect fossils and make archaeological excavations in the Big Badlands of South Dakota. The former was headed by Dr. Walter Granger, curator of paleontology of the museum. The latter—which was organized in conjunction with the South Dakota School of Mines—was under the direction of Dr. Joseph P. Connolly and James D. Bump. The two parties unearthed many fossil specimens including very rare birds and the three-toed horse and tapir.

Bradford Washburn, who has headed exploring parties in Alaska over a period of some years, returned to that area in 1940 and succeeded in scaling the summit of Mount Bertha in the Fairweather Range. He was accompanied by his wife, Barbara Washburn, also a noted mountain climber; Maynard Miller of Tacoma, Wash.; Michl Feuersinger, Sugar Bowl, Calif.; and Thomas Winship of Boston. Theodore A. McGraw of Grosse Pointe, Mich., explored the Wrangell Mountains of Alaska, in search of specimens of mammals for the American Museum of Natural History.

In north Labrador, the disappearance of two American explorers nine years ago was believed solved with the discovery by Labrador Indians of a human skeleton some 170 miles from the Hudson Bay Company's outpost at Davis Inlet. It was found approximately 20 miles from the site where another unidentified skeleton was discovered eight years ago. The two explorers—Herman J. Koehler, 60, of Orange, N.J., and Fred R. Connell, Jr., of Glen Ridge, N.J.—sailed from Montreal July 14, 1931, and eventually paddled a canoe up the Koksoak River from Fort Chimo on Ungava Bay to explore and chart new territory which until that time had been seen only by Indians.

**Central America.** In southern Honduras, in a jungle region known as the Mosquitia territory, a party of American scientists announced the discovery of the long-rumored "Lost City of the Monkey God" in an almost inaccessible area between the Paulaya and the Plantano Rivers. The expedition, headed by Theodore A. Morde and under the auspices of the Museum of the American Indian, Heye Foundation, spent four months in the territory, living under native conditions, and traveling mostly by pitpans (40-ft. wooden canoes) with the help of Suma guides.

Evidences were found of a once-thriving but now extinct civilization, that of the Chorotegans, which flourished at about the time of the Mayan culture. Many examples of Chorotegan art and industry were found including sculptured religious idols, stone household utensils, a six-tone flute, and primitive razor blades.

**South America.** Discovery of two lost cities of the Incas adjoining the ruins of Machu Picchu in Southern Peru was announced by Paul Fejos, Hungarian scientist and head of an expedition sponsored by the Swedish industrialist, Axel Wenner-Gren. Situated at an altitude of 12,000 ft. and known as fortress towns, the two cities were called Phuyu Pata Marka (City Above the Clouds) and Sayaq Marka (Inaccessible City), and comprised 21,000 and 3600 square yards respectively. Largely an appropriation of natural cave conditions to human use, the cities included great granite towers, signal stations, temples, houses, terraces, baths, water courses, roads, and stairways.

The expedition started westward up the Rio Madre de Dios from Puerto Maldonado, in eastern Peru, on May 18 with 67 men, including 21 soldiers. Its paraphernalia consisted of six outboard motorboats, a Diesel motor barge, three months' food provisions and a Peruvian naval hydroplane.

A group of British mountain climbers led by A. E. Gunther of the Alpine Club made the first ascent of Pico Bonpland and the Columna South Peak in Venezuela. Pico Bonpland, jutting 16,300 ft. into the sky, was the last of the big unscalped peaks of the Andes.

**EXPLOSIVES.** See CHEMISTRY, INDUSTRIAL; MINES, BUREAU OF.

**EXPORT CONTROL, Administrator of.** See NATIONAL DEFENSE ADVISORY COMMISSION.

**EXPORT-IMPORT BANK OF WASHINGTON (EIB).** The Export-Import Bank of Washington, an agency of the United States, was established on Feb. 12, 1934, for the sole purpose of financing and facilitating trade relations between the United States, its territories, insular possessions, and foreign countries. By an act of Congress approved Sept. 26, 1940, the Export-Import Bank continues as an agency of the United States until Jan. 22, 1947, or such earlier date as may be fixed by the President by Executive order. By this act it was also granted specific authority to make loans which will assist in the development of the resources, in the stabilization of the economies, and in the orderly marketing of the products of the countries of the Western Hemisphere.

The Bank has lending authority of \$700,000,000. Its present capital consists of \$1,000,000 of common stock and \$74,000,000 of preferred stock. All common stock except 11 shares standing in the respective names of the trustees is held jointly by the Secretaries of State and Commerce in their official capacities. All of the preferred stock has been purchased by the Reconstruction Finance Corporation. Its governing body is a board of eleven trustees representing the Departments of State, Treasury, Commerce and Agriculture, and the Reconstruction Finance Corporation.

The Bank's activities increased substantially during the calendar year 1940. Commitments authorized totaled \$371,173,006 against \$74,831,827 in 1939. South and Central American authorizations amounted to \$206,245,721 as compared with \$46,102,287 in 1939. Actual disbursements in 1940 amounted to \$95,298,476, and loans outstanding as of Dec. 31, 1940, totaled \$131,031,867. During the calendar year ended Dec. 31, 1940, net earnings amounted to \$3,501,592.

During the year 1940 the continuation of the European war caused serious economic problems for many countries largely dependent upon export markets for means with which to purchase essential goods from abroad. To alleviate this situation, caused by the loss of markets and increased demand for dollar exchange, and at the same time to maintain long established markets for United States exporters, the Export-Import Bank approved substantial credits to many central banks of South and Central America. In order further to assist such economies, loans were approved to finance the purchase of United States commodities and machinery required for the construction of public works projects and vitally needed highways. During the past year the Export-Import Bank extended substantial credit to various European countries and to China in order to maintain

our foreign commerce and to insure the adequate supplies of strategic products needed in our defense program.

**FAIRS, EXPOSITIONS, AND CELEBRATIONS.** The New York World's Fair was opened to the public for a second season, May 11 to Oct. 27, 1940. The "Forty Fair," as it was called, differed from its predecessor of 1939 (see the 1939 YEAR BOOK) chiefly in the effort made to add to its popular appeal. Admission was lowered from 75 to 50 cents. The amusement area was redesigned as the "Great White Way" with an intensified new lighting system and many totally new exhibits. The elaborate ceremonies of the previous year were greatly reduced, and the Fair was advertised as "just a super-County Fair" with Elmer, a supposedly typical American, as official greeter.

In the exhibit area the most noticeable change was the decrease of foreign exhibitors from 58 to 43 as a result of war conditions abroad. Conspicuously absent was the building of the Soviet Union, which had been torn down and was replaced by the "American Common." The Netherlands, Turkey, Argentina, and Chile were others who failed to reopen their exhibits. The outstanding new attraction was "American Jubilee," an elaborate patriotic spectacle.

"American Jubilee" occasioned the only repetition of the numerous labor troubles which had marred the Fair's 1939 season. A threatened actors' strike was averted, however, before the opening date. The only other serious incident in 1940 was the explosion of a bomb taken from the British pavilion on July 4 and placed at the edge of the grounds. Two detectives were killed and others injured in trying to dismantle the bomb.

The New York Fair ended its two-year existence with all records broken for both cost and attendance. The cost was estimated at \$155,000,000. Attendance reached a grand total of 57,263,334, of which 45,008,385 were paid admissions. The paid attendance was 19,191,120 for 1940 as compared with 25,817,265 for 1939. The daily attendance record was broken on the final day with 537,952 tickets sold, the previous high having been 492,446 on Sept. 3, 1939.

The Fair entered its second season with outstanding bonds amounting to \$24,042,206. It was announced on October 31 that the more than 3000 bondholders would receive 39.2 cents on the dollar. Gross revenues were estimated at \$11,260,000 for 1940 as compared with \$20,177,059 for the 1939 season. Revenue prior to opening was \$10,302,495. Of the money-making attractions, "Aquacade" proved most profitable, reportedly grossing \$4,500,000 from more than 8,000,000 customers in the

2 seasons. "American Jubilee" sold 2,000,000 tickets and "Railroads on Parade" more than 1,000,000 in 1940.

When the Fair closed, demolition was begun at once on some 385 structures to make way for the new Flushing Meadow Park. According to plan, the New York City building, the New York State amphitheater, and Constitution Mall were preserved intact. In addition, the Park received offers of a number of other buildings, and it was announced that the Japanese Pavilion, the Turkish Fountain, the Polish Tower and Statue, the House of Jewels, and the Masterpieces of Art building would be preserved. The Park will have elaborate facilities for sports and recreation, and is scheduled for completion in 1942. See **ART**.

Continuing to parallel the case history of the New York Fair, the San Francisco Golden Gate Exposition reopened for a second season (May 25-September 29) with lowered prices and greater emphasis on entertainment value. The exhibits were more diversified, a greater amount of space was devoted to small shows, and the Gayway was almost entirely new. Color and lighting, which provided a striking feature of the 1939 Exposition, were revised to produce even more beautiful effects. A circular pool with a high fountain was sunk in the Court of Flowers. International Hall was remodelled to accommodate Billy Rose's "Aquacade," which proved to be, with "Water Follies" and "Cavalcade of a Nation," among the most popular entertainments. New or enlarged exhibits were sponsored by the Ford Motor Company, General Motors, and General Electric.

Attendance in 1940 was 6,545,796, bringing the two-year total to 17,041,999. The record gate of 211,020 was recorded, as in New York, on the final day, the previous high having been 187,750 on Oct. 8, 1940. It was estimated that creditors at the close of the 1940 season would receive about 85 per cent, as contrasted with the 15 per cent paid to creditors who withdrew when the Exposition went into bankruptcy in 1939. Conversion of Treasure Island into a municipal airport was immediately undertaken.

Although two "world's fairs" closed in 1940, plans and actual construction were under way for another, the World's Fair scheduled to be held in Rome in 1942. On June 3 the Italian government announced that the exposition had been indefinitely postponed, but in September it was announced that work would shortly be resumed. Political observers sought in these announcements an indication of official optimism or pessimism with regard to the war.

In the United States, the year 1940 marked the 400th anniversary of the first extensive exploration of the Southwest by members of the white race, the Spanish Conquistadores. The event was celebrated as the "Coronado Cuarto-Centennial" in three States—New Mexico, Arizona, and Texas. The program, which was supported by a Congressional fund, centered around a series of pageants and folk festivals presented throughout the three States during the summer and fall. The central pageant, the Coronado Cavalcade, depicted the story of Don Francisco Vasquez de Coronado's two-year expedition from Campostella, Mexico, to the Rio Grande, the Grand Canyon, and north into Kansas. The Casa de Coronado, a museum memorializing the meeting at this point of Spanish, Mexican, and Anglo-Saxon cultures, was dedicated near the camp site of Coronado's army at

Bernalillo, N.M. Various localities contributed their own stories in pageant form—that of Kit Carson at Taos and of General de Vargas at Santa Fe, for example. Folk festivals under the general direction of Sarah Gertrude Knott were held in many quaint villages.

The American Negro Exposition, acclaimed as the first real Negro world's fair in history, opened in the Chicago Coliseum on July 4. Supported by appropriations of \$75,000 each from Congress and the Illinois Legislature, the Exposition continued until September 2. Its 120 exhibits set forth the race's achievements in religion, music, sports, theater, art, science, and industry during the 75 years since the Emancipation Proclamation was signed by Abraham Lincoln. James W. Washington was the originator and president of the Exposition.

In Portugal the entire nation observed a six-months' celebration of the 800th anniversary of the founding of the Portuguese State and the 300th anniversary of the restoration of independence. All the former Portuguese dependencies participated. An "Exposition of the Portuguese World" was constructed near Lisbon at Belem, the marine suburb where Vasco da Gama set sail on his voyage to India. The central Pavilion of Exploration and Conquests was flanked by two buildings commemorating the medieval struggle toward nationhood and, on the other hand, the period of the restoration of independence. Modern Portugal was represented by typical village scenes. The stirring events of Portuguese history were recalled in pageant, dance, and patriotic gatherings at the sites where they occurred.

The observance was divided into three cycles. The spring cycle, devoted to the medieval period, was inaugurated with church services at which the Papal Bull recognizing the Portuguese Kingdom in 1140 was recited. Simultaneous sessions were held afterwards in every town hall and in the National Assembly. The flag of the first king was flown from many castles, bullfights were conducted, an exhibition of primitive art, and a naval review were held. The summer cycle commemorated the imperial epoch and featured a pageant of the life of 21 imperial provinces presented in procession through the streets of the capital. The Bragantine epoch, beginning with the restoration of independence in 1640, when Portugal was freed from Spain, was celebrated in the autumn with historical pilgrimages and restoration of a 17th century quarter of Lisbon.

The centenary of the landing of the first white settlers in New Zealand was observed on January 22 when Lord Galway, Governor-General of New Zealand, dedicated the Hall of Memories, built on the spot where the settlers landed (now the foreshore at Wellington). On February 6 there transpired a spectacular re-enactment of the landing of Captain Hobson at the Bay of Islands and the signing of the treaty of Waitangi, an agreement concluded Feb. 6, 1840, between the pioneer British settlers and the representatives of the Maori race.

Other national anniversaries of the year were the 400th anniversary of the founding of Santiago, Chile, and the 50th anniversary of the foundation of Rhodesia. In Rhodesia, on September 12, the ceremony of the hoisting of the British flag was repeated for the fiftieth time. The centenary of the introduction of the adhesive postage stamp was extensively celebrated in Great Britain, where the

event took place, and among philatelists all over the world.

**FALKLAND ISLANDS.** A British crown colony in the South Atlantic Area, 4618 square miles; population (Jan. 1, 1939), 2378. Capital, Stanley. Sheep farming is the chief occupation of the people. Trade (1938): Total imports, £113,522; total exports, £200,706. Finance (1938): Total revenue, £70,553; total expenditure, £70,673. The administration is under a governor, aided by an executive council and a legislative council. Governor and Commander-in-Chief, Sir Herbert Heniker-Heaton (appointed Jan. 3, 1935).

**Dependencies.** These include: South Georgia (1450 sq. mi.; pop., 750 in the summer and 250 in the winter), South Shetlands, South Orkneys, South Sandwich Islands, Graham Land, and various areas of land in the antarctic continent. Whaling is the chief occupation. Reindeer have been introduced and are thriving. Trade (1938): Total imports, £272,908; total exports (including re-exports of £211,361), £462,912. Finance (1938): Revenue and expenditure balanced at £11,547. The administrative authority is vested in the governor and the executive and legislative councils of the Falkland Islands.

**History.** The British Government announced on Mar. 6, 1940, that it would purchase the entire wool clip until one year after the war. A deficit of £8000 was shown in the 1940 budget estimates; about £21,000, equivalent to 30 per cent of the prewar revenue, was set aside for defense purposes; new taxation to provide additional revenue of £14,000 was imposed. The Falkland Islands Defense Force, composed of local volunteers, was organized.

**FARM CREDIT ADMINISTRATION (FCA).** Operating through 12 district offices, the Farm Credit Administration provides a complete and co-ordinated credit service for farmers and their co-operative business associations. Each district office is composed of four units—a Federal land bank, a Federal intermediate credit bank, a production credit corporation, and a bank for co-operatives.

The 12 Federal land banks make amortized long-term first mortgage loans to farmers through 3600 local national farm loan associations. Loans outstanding on Jan. 1, 1941, aggregated \$1,851,218,000 plus \$648,296,000 of Land Bank Commissioner loans made by the land banks as agents. The total capital of the Federal land banks was \$177,940,300 on Dec. 31, 1940. About 62 per cent of this amount

was owned by national farm loan associations and individual farmers borrowing directly from the banks. The remainder was provided and is owned by the United States Government.

The 525 production credit associations, organized, capitalized, and supervised by the 12 production credit corporations, made farm production loans totaling \$349,700,000 in 1940 compared with \$320,900,000 for the previous year. Capital stock owned by farmer members of production credit associations increased from \$15,312,915 to \$16,481,630 from Sept. 30, 1939, to Sept. 30, 1940. On the latter date 18.1 per cent of the total par value of stock outstanding was owned by farmer members and the remainder by the production credit corporations.

The 12 banks for co-operatives and a Central Bank for Co-operatives make facility, operating capital, and commodity loans to farmers' co-operatives. Loans made during the twelve months ended Sept. 30, 1940, aggregated \$93,269,000.

The 12 Federal intermediate credit banks operate as banks of discount. They are authorized to make loans to, and discount paper for production credit associations, banks for co-operatives, state and national banks, agricultural credit corporations, and livestock loan companies. Loans and discounts made during 1940 aggregated \$512,258,000. The capital of the 12 banks—amounting to \$60,000,000 on Dec. 31, 1940,—is owned by the United States Government.

Loan funds of the permanent institutions operating under the supervision of the Farm Credit Administration are obtained primarily from the sale of tax-exempt bonds and debentures to the investing public. These are not guaranteed by the United States Government. Farm loan bonds of the Federal land banks outstanding on Dec. 31, 1940, totaled \$1,755,151,540; Federal intermediate credit bank debentures aggregated \$200,475,000. Land Bank Commissioner loans are financed largely from the sale of Government-guaranteed bonds of the Federal Farm Mortgage Corporation.

The emergency crop and feed loan offices, also operating under the supervision of the Farm Credit Administration, loaned farmers \$19,470,625 in 1940. These loans are made from appropriated funds. The Farm Credit Administration is also responsible for the supervision of the 3782 active Federal credit unions.

Besides its activities which are primarily concerned with financing farmers and farmers' business co-operatives, the Farm Credit Administration carries on research. Headquarters of the 12 districts are located in Springfield, Massachusetts; Baltimore, Maryland; Columbia, South Carolina; Louisville, Kentucky; New Orleans, Louisiana; St. Louis, Missouri; St. Paul, Minnesota; Omaha, Nebraska; Wichita, Kansas; Houston, Texas; Berkeley, California; and Spokane, Washington. See UNITED STATES under *Administration*.

E. B. REID.

**FARM MACHINERY AND EQUIPMENT.** The sale of farm machinery and equipment in 1940, largely due to an increase in farm cash income over 1939 and the growing use of lightweight tractors and small harvesters, was quite satisfactory. Preliminary estimates by the Standard Statistics Co. placed the sale for the year at \$500,000,000, one of the best since 1929. During the latter part of the year the inauguration of the defense program materially changed the outlook

of the farm equipment industry as manufacturers in this field were likely to become, in part at least, producers of armament material and to be subject to the diversion of raw material through the priority claims of defense requirements.

Activities in the development, improvement, and use of farm machinery and equipment were continued by the industry, the U.S. Department of Agriculture, and the agricultural experiment stations. Work by the Department in which the stations co-operated in many instances related to farm structures, farm mechanical equipment, and rural electrification. The work on farm structures was directed largely toward farm-house design and remodeling, erection and arrangement of farm buildings including livestock shelters, construction of silos for grass silage, and the insulation and ventilation of farm storages. The Department reported the development of an anemometer for measuring low-velocity air movements in storage and transportation studies. In co-operation with the agricultural colleges the Department continued to provide farmers with plans for buildings and equipment suited to their purposes and localities.

Studies of farm mechanical equipment resulted in the improvement of a self-aligning disk-jointer and a trash-covering attachment to wheel plows, giving better coverage of corn stalks and trash respectively. Wheelharrow sprayers designed for borer control in sweet corn are already manufactured commercially. Grasshopper poison-bait distributors built according to plans furnished by the Department proved satisfactory. Studies of fertilizer machines and the placement of fertilizers in relation to the seed continued to show their effect on methods of applying fertilizers and on the design of fertilizer distributors. Disk furrow openers on sugar-beet planters proved preferable to shoe openers. The single-row, chain-feed, single-seed sugar-beet planter developed by the Department in 1937 has since been constructed on a multiple-row plan. Trials of an experimental snapping device for mechanical corn-pickers showed a marked reduction in losses of shelled corn, and a newly devised field harvester and chopper gave greater speed in ensiling grasses. Progress was reported also in studies of cotton picking, ginning and baling and flax pulling, retting and scutching equipment, as well as in the development of numerous devices and betterments such as egg coolers for maintaining quality during hot weather, poultry house equipment, and in the mechanical drying of hay.

The new and improved machines and devices placed on the market by the farm implement industry included tractors with wide-base rubber tires, tractor mowers, combined harvesters and threshers, silage crop harvesters and choppers, machine sprayers and dusters, soil conditioning implements, multiple row sugar-beet toppers and beet-field weeders, manure spreaders, and numerous devices and attachments for the better handling and operation of farm machines and implements. The use of the Diesel engine in farm tractors continued on the increase. Trade journals pointed out that while the production of all tractors in 1909 was estimated at 2000 the number manufactured in 1939 was 215,283, surpassed only in 1937. From the same source it was learned that in the number of tractors per 1000 farms, California was in the lead with 1282, followed by Illinois with 814, and Iowa with 714. In the smallest acreage of planted crops per tractor, Arizona

ranked first with 102 acres, California second with 105 acres and Indiana third with 120 acres.

During the last four years domestic business was said to have accounted for 88 per cent of all farm equipment sales, leaving only 12 per cent for export. In 1939 sales of combined harvesters and threshers, as reported, were nearly 20 per cent and sales of tractors about 23 per cent of all sales. Canada ranked first as a foreign buyer and Argentina second.

J. I. SCHULTE.

**FARMS AND FARMING.** See AGRICULTURE and the topics there referred to.

**FARM SECURITY ADMINISTRATION.** The Farm Security Administration was created by the Secretary of Agriculture on Sept. 1, 1937, as successor to the Resettlement Administration. Its purpose is to help farm families on, or near relief to become permanently self-supporting. Since 1935, when this type of assistance was first given under the authority of the Resettlement Administration, financial aid has been extended to more than 1,406,356 farm families. The work is divided into three phases.

**Rehabilitation Program.** Farmers unable to obtain adequate credit from any other source may receive small loans from the Farm Security Administration which will enable them to continue farming. These loans, based on sound farm and home plans, averaged \$325 each during the past fiscal year. They usually are just large enough to enable the farmer to buy seed, tools, livestock, fertilizer, and the other equipment he needs to making a living. The loans drew 5 per cent interest. At the close of the year, the number of active rehabilitation loan cases totaled 430,991.

A survey made at the end of the 1939 crop year showed that standard rehabilitation borrowers had increased their net income by an average of \$163, or 43 per cent, since coming on the program. Between 1935 and the end of the 1940 fiscal year, 127,713 debt-burdened farmers had been able to work out amicable adjustments with their creditors through the help of voluntary committees of local citizens appointed by the Farm Security Administration. Debts were scaled down about 22.9 per cent.

Community service loans often are made to groups of farmers in the same neighborhood to enable them to buy equipment or services no one of them could afford alone. As of June 30, 1940, 16,000 of these services, aiding 270,000 families, had been established.

As of June 30, 1940, county or district plans for group medical care for more than 80,000 needy farm families were in operation in 31 states.

In areas stricken by drought, flood, or hurricane, the Farm Security Administration makes subsistence grants to destitute farm families. These average about \$21 per month per family. During the past year the total cash grant disbursement to individual families amounted to about \$20,000,000.

**Tenant Purchase Program.** The tenant purchase program, authorized by the Bankhead-Jones Farm Tenant Act in 1937, enables a limited number of farm tenants and laborers to obtain loans to buy farms of their own. Congress appropriated \$40,000,000 for this purpose for the 1940 fiscal year, and 6172 loans were approved in approximately 1300 counties. These loans included money for building 3007 new dwellings, costing an average of \$1373. In addition, repairs were made on

3068 tenant-purchase farm dwellings; and barns and outbuildings were constructed or repaired on more than 7600 farms. Repayment of tenant-purchase loans extends over a period of 40 years at 3 per cent interest. An appropriation of \$50,000,000 was made for this program during the fiscal year. It was expected to provide for more than 9000 loans.

**Homestead Projects.** The Farm Security Administration administers 164 homestead projects which were turned over to it by the Resettlement Administration and other predecessor agencies. They are scattered throughout the country and vary in type; some having small individual farms, others having co-operative enterprises, and a few having industrial plants to supplement farm income. These projects provide homes for more than 15,000 families.

**Migrant Camps.** The FSA has established 40 permanent and 16 mobile camps to provide sanitary living conditions for a small part of the army of migratory agricultural workers. At the end of the fiscal year, the Administration had either completed or under construction 11,476 shelters and tent platforms, and 1729 labor homes. When the present program is completed, the camp facilities will serve 13,205 families at one time. See ARCHITECTURE. For subsistence payments, see RELIEF.

C. B. BALDWIN.

**FAROE ISLANDS.** A group of 21 islands (the chief being Bordö, Kalsö, Osterö, Sandö, Strömö, Suderö, Vaagö, and Viderö) north of Scotland, forming a county of Denmark. Total area, 540 square miles; population, 25,744. Capital, Thorshavn (on Stromö), 3200 inhabitants. The chief exports consist of fish, whale oil, woolen goods, lambskins, and feathers. A Danish governor heads the administration. The local parliament (Lagting) of 25 members elects a member to the Danish Landsting (upper house), and the people elect, by vote, a member to the Danish Folketing (lower house).

**History.** On Apr. 12, 1940, officials of the British Government called on the Danish governor and the president of the Lagting and told them that Great Britain would land troops and apply censorship to the radio station. The next day British troops were landed to prevent the islands from falling under the control of Germany. Assurances were given that the troops would be withdrawn at the end of the war, but the Lagting adopted a resolution of protest. See DENMARK under History.

**FASCISM.** Spurred on by the great German military victories in April, May, and June, fascism continued its triumphal march in Europe and many other parts of the world during 1940. Denmark, Norway, the Netherlands, and Belgium were conquered and their small native Nazi minority groups, supported by the German occupationary officials, were given the task of eradicating democratic institutions and converting the pro-democratic masses, by combined force and persuasion, to Nazi principles and Hitler's "new order" in Europe.

Luxemburg and Alsace-Lorraine were brought under direct Nazi rule through annexation to Germany. The democratic French Republic collapsed in defeat and was replaced by a Fascist State under Marshal Pétain. King Carol's quasi-Fascist regime in Rumania was replaced by an outright Fascist and totalitarian system controlled from Berlin. Japan formally adopted the Fascist political system

and Hungary, Slovakia, Rumania, and Japan were brought into the Rome-Berlin military alliance. Increasing internal and external pressure—political, military, and economic—was brought upon Bulgaria and Yugoslavia to accept full-fledged fascism and throw in their lot with Nazi Germany. Similar pressures were brought upon Sweden and Switzerland to abolish democratic liberties and conform to Berlin's economic and political program.

Finland held to its democracy, but like Rumania was forced by the threat of further Russian aggression into closer political and military relations with Hitler's Germany. The Fascist-type dictatorship established by Premier Metaxas in Greece was strengthened by its successful resistance to Italian aggression. But on the other hand the Fascist regime in Italy was badly discredited by the reverses to its arms in Greece, North Africa, and the Mediterranean. Likewise the sturdy, effective resistance offered by democratic Britain to the Nazi-Fascist march of aggression strengthened the morale and prestige of the world's remaining democracies. The rearmament of the United States and its extension of more aid to Britain and China had a similar effect.

**Nazism as an Instrument of Warfare.** Chancellor Hitler's successful use of propaganda and of pro-Nazi native movements in winning his sensational military victories over Norway, the Netherlands, Belgium, and France directed world-wide attention to this new technique of warfare. An analysis of the Nazi methods, prepared by Col. William J. Donovan and Edgar Mowrer, was published by Secretary of the Navy Knox at Washington in August as part of the national defense program. According to this statement, Nazi Germany was spending \$200,000,000 annually on organizational and propaganda activities in foreign countries in pursuit of its objective of world domination.

To pave the way for subsequent military conquest, the statement asserted, Nazi efforts were concentrated first of all upon the organization under Nazi leadership of persons of German birth or descent living in foreign countries. This work was carried on by the Organization Abroad, an agency of the German Nazi party with headquarters at Stuttgart. It was headed by Ernest Wilhelm Bohle, "State secretary" in the German Foreign Office, who was aided by some 800 assistants. This organization was said to have nearly 4,000,000 members, organized in more than 600 local groups or "supporting points" in some 45 countries. Each local group was organized along the same lines, with its Hitler Youth, Storm Troop, Labor Front, Hitler Sport, and other subsidiary organizations. All were directed from Stuttgart in methods of convincing non-Germans of the necessity of German victory and in preparations for supporting the Reich by violent action when the military stage was reached.

The Donovan-Mowrer statement went on to describe seven other agencies, in addition to the Organization Abroad, that were working for Hitler outside of the Reich. These were listed as the German political police or Gestapo, Dr. Joseph Goebbels' Propaganda Ministry, the German Labor Front, the intelligence services of the German army, navy, and air force, and finally the embassies, legations, and consulates of the German Foreign Office all over the world. It was pointed out that the German Government normally had four or five times as many "accredited" diplomatic and con-

sular representatives in each post as any other government.

The press attachés of the German diplomatic and consular posts were said to play a particularly important role in supplying propaganda and other material to some 1700 German-language newspapers outside Germany, checking on the effectiveness of German radio programs, winning over the native press to a pro-Nazi policy, and combating anti-Hitler newspapers and periodicals. Free news, picture, and publicity services, replete with Nazi propaganda, were provided the world over to non-German publications willing to use them. Native pro-Fascist organizations in the United States and elsewhere were plentifully supplied with propaganda leaflets, pamphlets, and films prepared in the languages of the respective countries. A "fifth column" of native traitors and other subversive elements was organized to co-operate with the German Nazi organizations in each foreign country. See FIFTH COLUMN.

"In the United States," the Donovan-Mowrer statement continued, "an organization of Nazis is being trained in arms. As matters now stand, it is conceivable that the United States possesses the finest Nazi-schooled fifth column in the world, one which, in case of war with Germany, could be our undoing."

**Revolutionary Propaganda.** In their efforts to create dissension and confusion in the democratic countries, the Fascist regimes in Germany, Italy, and Japan made increasing use of Communist revolutionary slogans and appeals. The *New York Times* correspondent in Berlin on February 13 reported that the Nazis were expanding their "propagandistic campaign against plutocracies, capitalism, and the rule of gold." He quoted excerpts from a long appeal to the workers of the world by Dr. Robert Ley, head of the German Labor Front. Ley called upon the "workers of all lands, including English and French workers" to unite against "your common enemy . . . English-Jewish-democratic high finance."

This appeal was taken up by the Italian and Japanese press and by pro-Fascist organs in democratic countries. Communist propaganda in the democracies took the same line. In some countries there was open collaboration between Fascists and Communists in their efforts to undermine democracy. The bitter hostility that characterized Communist-Fascist relations previous to the Hitler-Stalin accord of Aug. 24, 1939, was notably absent throughout 1940 except in some Balkan countries where immediate Russian and German interests clashed (see COMMUNISM). French Communists and Fascists joined forces in paving the way for France's collapse through defeatist and anti-war propaganda and through physical sabotage of French military preparations. But once the conquest of France had been achieved, the Communists received short shrift from both the German authorities in occupied France and from Marshal Pétain's Fascist regime in unoccupied France.

In Great Britain, Sir Oswald Mosley's Fascist Union made common cause with the British Communist party in demanding acceptance of Hitler's peace terms. The Churchill Government jailed Mosley and most of his adherents in May and June, when they actively assisted German preparations for an invasion of the British Isles.

**Fascism in United States.** Like the Communists, the various Fascist organizations and movements in the United States during 1940 concen-

trated upon efforts to keep the country neutral in the European War, to prevent further American aid to Britain and her Allies, and to obstruct the Federal Government's rearmament and defense programs. As in other parts of the world, the Fascist groups were spurred into increased activity and boldness by the German military victories in Europe during April, May, and June. However the effectiveness of their propagandist and other activities waned during the latter part of the year as a result of the failure of the Axis offensives in Britain, Greece, and Egypt, and the mobilization of pro-democratic sentiment in America.

**Dies Committee Revelations.** Revelations by the Dies Committee (q.v.) and other agencies and individuals shed more light on the activities of the German Nazi, Italian Fascist, and native Fascist movements in the United States during the year. The Dies Committee's full report to Congress, published Jan. 3, 1940, asserted that the Hitler-Stalin pact had weakened the dominant appeal of Nazi-Fascist groups, organized to fight communism. Evidence concerning the German-American Bund's activities gathered by the committee was recapitulated at length. The report declared the evidence "establishes conclusively" that the Bund received its inspiration, program, and direction from the Nazi Government.

As to the native "Nazi-Fascist" movements, the committee reported that all had two primary aims—a radical change in the American form of government and the collection of dues from misguided citizens. Leaders of these groups were accused of "a form of racketeering." It was charged that "when money ceases to flow into the coffers of one organization, they abandon it and start another one. These groups . . . make their appeal to the basest forms of religious and racial hatred."

On November 16 Chairman Dies announced that evidence accumulated by his committee "confirms that Germany, Italy, Japan, and Russia are working very closely in the United States, are exchanging information and actively co-operating in many ways." He said their immediate objectives were "to prevent this country from quickly preparing its defense and . . . to prevent our extending aid to Britain." The committee had proof, he said, that agents of the four powers were "entrenched in industries vital to national defense." He said there was little doubt that explosions in plants engaged in defense contracts were due to sabotage.

Evidence linking German diplomatic, consular and other agents in the United States with Nazi propaganda and espionage activities and with penetration of the economic structures of the United States and some Latin American countries was published by the Dies Committee in the form of a "White Paper" on November 21. The White Paper stated that Dr. Ferdinand A. Kertess of the Chemical Marketing Co. of New York, a German-born American citizen, had jurisdiction over trade arrangements between Germany and the United States and Germany and South America; that Manfred Zapp, head of the Transocean News Service in New York, was the agent for German propaganda in the United States and helped direct German propaganda efforts in South America; that Dr. Zapp had sought to promote ill feeling between the United States and Japan in order to keep America neutral in the European War; and that the American Fellowship Forum, the German Library of Information and the German Railroads Information Office (all with offices in New York) were

instruments of German propaganda. Correspondence between these agencies and the German Embassy in Washington supporting these charges were among the hundreds of exhibits included in the "White Paper."

Meanwhile Dies Committee agents on November 18 raided offices of "Italian and German organizations" in Chicago, New York, and other cities and seized their files, documents, and ledgers. On the West Coast they took into custody Heinrich Peter Fassbender, of Duesseldorf, Germany, who said he had been employed by the German secret police since 1935. After questioning officials of 10 German and Italian organizations in Chicago, Chairman Dies announced on November 19 that he had obtained sufficient evidence of fifth column activities in Chicago to warrant indictments and prosecutions. Primarily as a result of the Dies Committee investigations, Congress during 1940 passed legislation designed to curb the activities of Fascist, Nazi, and Communist groups under foreign control (see COMMUNISM).

**Activities of the Bund.** The Dies Committee's revelations concerning the German-American Bund were supplemented by inquiries into its activities by other Federal and local agencies. On July 4 the three chief leaders of the Bund were arrested in advance of an Independence Day celebration at Camp Nordland, N.J., recreation center of the Bund's New Jersey unit. They were G. Wilhelm Kunze, acting leader since the imprisonment of Fritz Kuhn in 1939 (see YEAR BOOK, 1939, p. 258); August Klapprott, Eastern leader of the Bund and manager of Camp Nordland, and Mathias Kohler, State treasurer of the Bund. They were charged with violating the State law prohibiting the wearing of uniforms and the display of emblems of a foreign nation and the circulation of literature inciting race or religious hatred. On October 10 a Sussex County grand jury voted indictments against the three men and five other Bund members.

Further attention was attracted to Bund activities in New Jersey on August 18 when 700 of its members joined with several hundred members of the Ku Klux Klan in an "Americanism" rally at Camp Nordland. On December 19 agents of the Federal Bureau of Investigation raided the Chicago office of the Bund and seized membership lists. An investigator of the State's Attorney's office reported that these records indicated that from 1500 to 2000 Bund members were in the U.S. military, naval, and air forces. On December 20 Attorney General Jackson at Washington ordered an investigation to determine whether the Bund membership list had been bolstered by newly naturalized citizens. It was suspected that Nazi agents and sympathizers had secured citizenship papers to shield their true reason for being in the United States and to gain privileges denied to foreigners.

**The Westrick Case.** German efforts to win American business leaders over to the idea of collaboration with Hitler's Reich received publicity in connection with the activities of Dr. Gerhard Alois Westrick, who arrived in New York in March, 1940, to become Trade Counselor of the German Embassy at Washington. Setting up a New York office, with Baroness Irmgard von Wagenheim as receptionist, he established contacts with many prominent business and professional men with the ostensible aim of promoting German-American business.

An investigation of his activities by the *New York Herald Tribune* and other newspapers re-

vealed that he had given false information to obtain an automobile driver's license, registration certificate, and license plates. It was then discovered that the automobile had been purchased for Dr. Westrick with funds of the Texas Corporation at the order of Capt. Torkild Rieber, chairman of the board of directors. Although Captain Rieber insisted that his relations with Dr. Westrick had "no political significance," his resignation as president of the Texas Corporation's board was accepted on August 13. At the same time Dr. Westrick and his family secretly left New York and on August 19 sailed from Los Angeles on a Japanese ship.

**Italian Fascists in America.** Goffredo Pantaleoni, who resigned as head of the Italian Tourist Information Office in New York in protest against Mussolini's co-operation with Hitler, asserted in a statement issued June 8, 1940, that Fascist agents, controlling some 2000 Italian Fascist party workers in the United States, were working to force or persuade five million Americans of Italian origin to do the work of the Rome-Berlin Axis.

On June 13 Police Commissioner Valentine of New York City made public the results of a lengthy investigation into the activities of Italian Fascists in New York and elsewhere. The statement asserted that documentary evidence had been gathered demonstrating that officials of the Italian Consulate General in New York, under cover of diplomatic immunity, were directing the organization of Fascist groups and actively disseminating Fascist propaganda.

The noted anti-Fascist historian, Prof. Gaetano Salvemini, in a study of Italian Fascist activities in the United States issued by the American Council on Public Affairs on October 12, asserted that only 5 per cent of the Italian-American residents of the United States were outright Fascists but that they had influenced about 35 per cent of the Italian-Americans. The mentality of the 35 per cent, he said, "has not yet clearly become Fascist and anti-democratic but . . . might crystallize at the first emergency." He estimated that 10 per cent of Italian-Americans were definitely anti-Fascist, while the other 50 per cent were in no way concerned with politics. He charged that the staffs of the Italian embassy and consulates were busily engaged in Fascist propaganda on the radio, in newspapers, and in schools, churches, and clubs.

**The Christian Front.** Of the numerous American pro-Fascist movements, all of relatively minor importance, the Christian Front received the greatest attention during 1940 as a result of the trial of 14 of its members in a Brooklyn, N.Y., Federal Court on charges of conspiring to overthrow the government and to steal government property (see *New York under New York City*).

**Latin America.** The German military successes in May and June and the collapse of one democratic government after another in Europe were a marked incentive to Fascist movements in Latin America. Anticipating the early defeat of Britain, the pro-Fascist groups in some Latin American republics shed their veil of secrecy and boldly made preparations for bringing South America under Axis domination. Early in June the Uruguayan Government uncovered a plot by the Uruguayan branch of the German Nazi party to seize control of the republic with the aid of Nazi units in Argentina and Brazil and convert it into an agricultural colony of the Reich. Despite the material and moral support given Uruguay by Brazil and the

United States, the fear of future German reprisals led the government to release 12 Germans arrested for subversive activity, while Congress voted down a motion to make the findings of the inquiry into the plot available to the other American governments.

According to John W. White, Buenos Aires correspondent of the *New York Times*, the investigation revealed that "efficient Nazi organizations in several South American countries are plotting to help local 'outs' to overthrow existing governments and set up regimes favorably disposed toward totalitarian ideology." Efforts of this kind were apparent in Argentina, Brazil, Chile, Ecuador, and Mexico, and to a lesser extent in every other Latin American country. At the same time Nazi-Fascist organizations throughout Latin America intensified their efforts to undermine existing pro-democratic institutions and governments by propaganda, spying, terrorism, the boycott, and other forms of economic and financial pressure.

The frank revelation of Axis ambitions aroused the governments and pro-democratic elements throughout Latin America to their danger and spurred them to more active counter-measures. Such measures were taken at the Havana Conference and other Pan American meetings (see *PAN AMERICANISM*), by various governments, and by newly organized private associations for the defense of democracy (see the individual countries under *History*).

During the last months of the year the attention of the Spanish American countries was concentrated upon the activities of the Spanish Falangist (*Falange Española*) movement. In November pro-democratic newspapers, such as *Crítica* in Buenos Aires, charged that Hitler was using the Falange branches throughout Latin America as a more effective instrument of peaceful penetration than the Nazi organizations. Falangist activities similar to those engaged in by the German Nazis and Italian Fascists aroused violent controversy in Argentina, Cuba, Mexico, and Uruguay.

See **COMMUNISM; DIES COMMITTEE; FIFTH COLUMN; NORTH CAROLINA; and ARGENTINA, AUSTRALIA, BOHEMIA AND MORAVIA, BOLIVIA, BRAZIL, BULGARIA, CANADA, CHILE, COLOMBIA, COSTA RICA, CUBA, DENMARK, ECUADOR, FINLAND, FRANCE, GERMANY, GREAT BRITAIN, GREECE, HUNGARY, ITALY, JAPAN, MEXICO, NETHERLANDS, NORWAY, PANAMA, PARAGUAY, PORTUGAL, RUMANIA, SLOVAKIA, SOUTH AFRICA, SPAIN, SWEDEN, SWITZERLAND, URUGUAY and YUGOSLAVIA**, under *History*. See also **FRENCH LITERATURE, GERMAN LITERATURE, ITALIAN LITERATURE, SCANDINAVIAN LITERATURE**, etc.

**FASHION EVENTS.** The year marked the beginning of a new era in American Fashions. On June 14 Paris, the source of creative fashion, was cut off. For the first time the American manufacturer and designer was forced to stand alone. Whether they will march forward or will sink into banal mediocrity is in question. The opportunity is now here.

In fairness, we must state that there were favorable forces working for the creative genius of Paris which do not exist in America today. For centuries that city has had raw materials, low wages, and a wealthy audience constantly coming and going. There existed a close co-operation between artist, designer, and social leader. Skilled help was available, and textile manufacturers and creative craftsmen were not only willing but eager

to back up designers even to the point of weaving materials in experimental quantities and placing them on consignment. Even the government was helpful in financing needy and worthy firms and in punishing style pirates with imprisonment. Such conditions are ideal for creative effort and are the result of centuries of development.

America, however, has not got a couture trade, though it has a flourishing ready-to-wear industry which, with its subsidiary businesses, represents a larger volume in dollars than does the automobile industry. Fashion in America is mechanized; in France it was a handicraft and it is hands and minds that create, not machines. In America the wages paid to workers are approximately eight times that paid to the needle trades in Paris. Employment practices are governed by labor laws which regiment production and thereby put a premium on initiative. Manufacturer and designer are not adequately protected, nor are government loans available on mental and artistic collateral. Textile mills are set up for large scale production and cannot, therefore, afford to carry out experimental ideas—though some progressive firms are establishing this needed service; the Botany Mills and those of S. Stroock are co-operating with designers in an altruistic effort to further creative effort through newly organized experimental departments. And in addition to these, there is evolving in New York a colony where the designer, artist, sculptor, actor, and social leader are mingling and creative genius is being stimulated. It is doubtful, however, that New York can ever become the artist's home as was Paris. Living costs are too high.

Despite these handicaps a résumé of suppliers reveals that American manufacturers are producing goods on a par with, or better, than were made in Europe in cottons, woollens, silks, rayons, and leather, with the exception of hand-loomed and hand-blocked fabrics. Labor charges and living costs will never permit these luxury materials to be produced in America on the low-cost European basis.

Meanwhile the hope for America's fashion future rests primarily in the hands of a few designers and couturiers—Hattie Carnegie, Valentina, Nettie Rosenstein, Sally Victor, Germaine Montiel, Louise Barnes Gallagher, Clarepotter, Anthony Blotta, John Fredericks, Lilli Dache, Florence Riechman—in the East. In the West, with such creative designers as Alice Evans, Joyce, and Adrian. In addition, certain retail outlets, cut off from Paris resources, are building with increased enthusiasm their special order departments. Among them are Bergdorf Goodman and Saks Fifth Avenue in New York, Neiman Marcus in the South, and I. Magnin in California. To them the manufacturers will look for inspiration and their scouts will continue to frequent and to report from the places where smartly dressed women congregate—the Colony, Ritz, Belmont, Meadowbrook.

New retail buying trends are developing. To Seventh Avenue in New York City (known in the trade as "the market") retail stores send their merchandise managers and buyers several times a year. However, fashion manufacturers are spreading through the Middle West and are becoming increasingly successful on the West Coast. It has been estimated that 75 leading stores are now buying 10 per cent of their merchandise in Chicago while buyers in cities of 15,000 and less, finding the trip to New York too expensive, are concen-

trating their buying in five cities, namely Chicago, St. Louis, Dallas, San Francisco, and Los Angeles. Many leading stores throughout the country continue to be guided by the mailed reports of Tobé, a fashion advisor, who covers the New York market and whose keen analyses and predictions have proven their worth since the establishment of her business some 15 years ago.

Fashion Press. Three periodicals that have been important in the promotion of Paris fashions—*Vogue*, edited by Edna Woolman Chase; *Harper's Bazaar*, edited by Carmel Snow, and *Women's Wear*, edited by Winifred Ovitte—have increased their efforts to promote American fashions and have done so in a sensible, eclectic, non-flag-waving manner. Formerly the editors of these magazines attended the showings of the designers' collections in Paris and selected from the several thousand styles shown some 50 or 60 to be featured on their pages. This was a source of inspiration and authority to retailers, manufacturers, and the consumer. Now their attention is limited by the war to the American fashion picture which they are reporting with honesty and imagination.

Fashion information is also disseminated to an important degree by women's magazines of large circulation—*Good Housekeeping*, *McCall's*, *Woman's Home Companion*, *Ladies Home Journal*. An outstanding success in this highly competitive field has recently been achieved by *Mademoiselle*, edited by Mrs. Betsy Blackwell, which features youthful medium priced merchandise.

Important to the fashion trade are the daily articles written for the women's pages of newspapers by syndicate editors living in New York or in leading cities.

Fashion Organizations. The Fashion Group, a non-commercial organization of professional women, organized in New York now has eight regional groups located in principal cities throughout the United States and a total membership of 980. Julia Coburn is its president. Luncheon meetings are held monthly at which various phases of fashion are discussed by prominent speakers. The purpose of the Fashion Group is to "advance the principles of applied art in industry and to foster good taste in fashion; to encourage the co-operation of those engaged in conceiving, designing, and executing fashions; and, through proper education and the dissemination of useful information, to inspire a keener interest in fashions to the end that those engaged in the field of fashion may better serve themselves and the public at large."

Fashion Developments. Fashion progressed on an even keel throughout the year. It was notable for a spirit of frankness and youthfulness, with a lack of absurdities and conceits. This was probably due to the sobering influence of the war abroad. The last Paris collections arrived at mid-season via clipper, and from that time on all inspiration from abroad was ended.

At the beginning of the year New York saw a magnificent exhibition of Persian art owned by American collectors and, just as similar exhibitions in Paris had their effect upon fashion, so this exhibit ushered into the higher style group, Persian colors and designs in costumes and in jewelry.

In the spring new colors came to the fore, Cocoa brown, Elephant gray, with a brighter-than-Navy Blue, and a Soldier Blue in the lead. Skirts were shorter, the natural waistline was accentuated and simple costumes were dramatized by over-size pockets, buttons, bags. Off-the-face hats

were popular for daytime wear and for evening the shawl entered importantly.

During the summer and early spring travellers, who formerly visited the Riviera, cruised to South America and as the year progressed there was a rising interest in South American costumes adapted from the clothes of the natives, and colors such as yellow reds, yellow, brilliant pinks, purple, beige were worn in brilliant combinations. Later a growing spirit of patriotism found everyone wearing jewelry and accessories emblazoned with national emblems, flags, shields, crests, and the wording of national anthems. This led to tri-color costumes, red, white, and blue. To mate with these fashions cosmetics rose to clear, brilliant reds and bore such names as Cockade Red, Flag Red, Military Red, and Navy Red.

College fashions showed an increased inclination toward mannish trends. Preferred fabrics were wools, tweeds, and corduroy. Skirts became a bit longer. Sweaters and skirts held their own with a longer fitted jacket for the formal suit. Jumpers, pinafores, jerkins, "beanie" and stocking caps topped every costume. Obvious innovations for evening wear were the reefer and the Polo coat with enormous golden buttons. Evening dresses were notable for extreme modesty. Fur coats of sheared beaver, mink, and the brown and beige furs became leaders in both the skirt length and the thirty-two inch length Bulky short jackets held the popularity they have enjoyed for several seasons. The outstanding fashion event was a chemical achievement—the introduction of Nylon hosiery. At the end of 1940, demand exceeded supply and the sale of Nylon represented only about 10 per cent of hosiery sales. See GARMENT INDUSTRY; SHOE INDUSTRY.

Without a doubt, 1940 will go down as an important year in American fashion history. The course ahead is replete with natural and economic obstacles. Wisdom, ingenuity, and co-operation can surmount them in time. The unhysterical, thoughtful, but honestly patriotic attitude of fashion leaders of the manufacturing press and retail fields, united with our natural inventiveness, is a hopeful guerdon of a bright future with wider, finer opportunity than there has ever been before.

CATHARINE OGLESBY.

**FBI.** See FEDERAL BUREAU OF INVESTIGATION.

**FCA.** See FARM CREDIT ADMINISTRATION.

**FCC.** See FEDERAL COMMUNICATIONS COMMISSION.

**FEDERAL ALCOHOL ADMINISTRATION (FAA).** Formerly an agency of the U.S. Department of the Treasury, abolished June 30, 1940, when its functions were transferred to the Alcohol Tax Unit of the Bureau of Internal Revenue. See ALCOHOLIC LIQUORS.

**FEDERAL BUREAU OF INVESTIGATION (FBI).** Although confronted with a greater volume of work and more responsibilities than in any other period of its history, from the standpoint of accomplishments, the Federal Bureau of Investigation during the fiscal year 1940 achieved its greatest success.

A changing world required emphasis on matters relating to the internal security of the United States. Shortly before the fiscal year opened, the President of the United States directed the Federal Bureau of Investigation to take charge of investigative work relating to espionage, counter-espionage, sabotage, and related matters. With the

outbreak of war in Europe this type of work increased materially. A total of 16,885 national defense matters were handled during the year which required investigative activity as compared with 1651 in 1939.

On Sept. 6, 1939, the Chief Executive, realizing that investigations of national defense matters must be conducted in a comprehensive and effective manner on a national scale, requested all law enforcement agencies to co-operate with the FBI in this vital work. Through a series of more than 500 conferences with FBI officials, attended by representatives of some 8000 state, county, and municipal law enforcement agencies, the entire law enforcement profession was mobilized to combat subversive activities and meet any emergency which might arise. To further amplify the co-operative procedures of the FBI with law enforcement agencies, regular quarterly conferences with the various local law enforcement representatives were arranged by the Bureau. In addition arrangements were perfected whereby the Special Agents in Charge of the 53 field divisions of the FBI can forward to the heads of local law enforcement organizations general intelligence matters for appropriate attention.

As an integral part of its national defense work, the FBI inaugurated in September, 1939, in accordance with the request of the War and Navy Departments, a program to survey the protective facilities of manufacturing establishments having large contracts to provide the Government with defense materials. A priority list of over 1500 factories for survey was furnished the FBI by the armed services. Over 1200 of these were surveyed during 1940. The sole purpose of the surveys is to submit recommendations to bolster the physical protective facilities of the manufacturing plants for the prevention of sabotage and espionage activities. Supplementing these surveys the FBI has prepared and issued a manual of suggestions for the protection of industrial facilities which is distributed to executive officials of industrial plants producing national defense materials.

To prevent hysteria and improperly supervised activity in the field relating to internal security, the FBI cautioned well-meaning citizens and patriotic groups against investigative activity on their part, and requested that they turn over all information relating to national defense to the nearest office of the FBI. The citizens' part in the FBI's defense program is one of observation.

The increase in work as a result of the emergency conditions necessitated the addition of Agents to the investigative force and the establishment of new field offices at Albany, New York; Baltimore, Maryland; Grand Rapids, Michigan; Houston, Texas; New Haven, Connecticut; Phoenix, Arizona; San Diego, California; Savannah, Georgia; Honolulu, Hawaii; Juneau, Alaska; and San Juan, Puerto Rico.

Newly appointed Special Agents, who are required to be between the ages of 23 and 35, graduates of accredited law schools or graduates of recognized accounting schools with three years' experience in commercial accounting or auditing, must successfully complete an intensive training course prior to their entry into the field to do investigative work.

During the past year, 2393 Federal fugitives from justice were located and apprehended by the FBI. In addition, 7809 fugitives were located for State, county, and municipal law enforcement agen-

cies through the Fingerprint Division of the FBI, making a total of 10,198 fugitives from justice located during 1940.

Convictions secured in Federal Courts in cases investigated by Special Agents of the FBI numbered 5605, as compared with 5162 convictions secured in the fiscal year 1939; 158 convictions were also secured during the year in cases under the national defense classification. Convictions were secured in more than 96 per cent of the cases investigated by the FBI and prosecuted in Court. During the year, sentences imposed in cases investigated totaled 10 life, 17,833 years, 4 months, and 28 days, while during the fiscal year 1939 sentences imposed totaled 12 life, 16,948 years, 6 months, and 5 days.

The total savings, fines imposed, and recoveries effected in the miscellaneous types of cases investigated by the FBI during the year amounted to \$58,390,180.64. The regular appropriation of the FBI for the period totaled \$7,300,000. For every dollar spent in connection with the regular operations of the Bureau for the year, \$8 were saved or returned to the Government or individual citizens in stolen property recovered, fines imposed and savings effected.

Since the passage of the Federal Kidnaping Act on June 22, 1932, 191 cases of kidnaping and conspiracy to kidnap have been investigated by the FBI, and all but two have been solved. These two cases are currently under investigation and in one case alone more than 22,000 suspects have been checked and eliminated. In the 189 solved cases, there were 376 convictions in Federal and State Courts with the imposition of sentences totaling 12 death, 42 life, 4363 years, 7 months, and 13 days. Eight kidnapers committed suicide, 8 were killed resisting arrest, 7 died by murder at the hands of their gang members, and 2 were lynched. During the past fiscal year, only 14 kidnaping cases occurred, all of which were solved.

The Federal Bank Robbery Statute was originally approved by the President on May 18, 1934. As a result of investigative activities of Special Agents of the FBI into this type of crime in co-operation with State and local police agencies, bank robbery has declined approximately 80 per cent since its peak year of 1932. During the past year, a total of 178 convictions were secured, with the imposition of two life sentences and other sentences totaling 2189 years and 28 days, with fines totaling \$52,601.

Investigations of violations of the White Slave Traffic Act during 1940 resulted in 476 Federal convictions with sentences totaling 1242 years, 8 months, and 28 days.

On Dec. 1, 1940, there was a total of 14,701,647 sets of fingerprint records on file in the Identification Division of the Federal Bureau of Investigation. Sets received during the year totaled 2,572,812, and identifications were effected in 60.4 per cent of the criminal fingerprints received.

In the crime laboratory, a total of 7097 examinations were made by FBI scientists in 1940, as compared with 5559 such examinations during the fiscal year 1939. Of the 7097 examinations made in the laboratory, assistance was rendered to other Federal agencies in 369 instances and to State, county, and municipal law enforcement agencies in 2065 instances. These scientific examinations involved 39,500 different specimens of evidence.

Throughout the year concentrated research work was carried on in the laboratory to devise ways

and means to meet the many problems that have arisen in connection with the widespread activities of the FBI in coping with sabotage, espionage, counterespionage, and other matters related to national defense. See FASCISM; FIRE PROTECTION.  
J. EDGAR HOOVER.

**FEDERAL COMMUNICATIONS COMMISSION.** The past year, besides commemorating the 20th anniversary of broadcasting is recorded by the Federal Communications Commission as making notable contributions to the development of radio in general.

Particularly outstanding was inauguration of a new type of broadcast popularly known as "FM." Regular use of frequency modulation will offer public demonstration of its claimed clarity and staticless qualities. Also, by using a different part of the radio spectrum (the high frequencies), FM promises to relieve the situation in the long congested standard broadcast band. The new service requires new equipment, sets, and servicing and should likewise have a stimulating effect on programming. By early February, 1941, the Commission had authorized 32 FM stations to go on a full commercial basis.

Television development received considerable impetus during the year. The Commission enabled about half a hundred stations in many sections of the country to experiment with various types of transmission with a view to reaching early accord on uniform standards which will enable television to move forward on a full commercial basis. Interested persons had budgeted a total of \$8,000,000 for this experimental work. The Commission's purpose was aided by exhaustive study of the situation by a National Television Systems Committee, representing the best minds in the industry, which was initiated by the joint efforts of the Radio Manufacturers Association and the Commission. The rapid evolution of television was attested during the year by developments in color reproduction, large-screen projection, and practical service demonstrations.

In the field of standard broadcasting, the coming year should see a marked improvement in service by reason of the North American Regional Broadcasting Agreement, which becomes effective Mar. 29, 1941. This compact between Canada, Cuba, the Dominican Republic, Haiti, Mexico, and the United States will tend to eliminate or minimize many interference problems in North America.

At the close of the last fiscal year, 846 standard broadcast stations were operating or under construction. Seventy-six new stations were authorized during the year and 10 deleted. For the 1939 calendar year, 705 standard broadcast stations (including networks), reported time sales approaching \$130,000,000, and expenses of slightly more than \$100,000,000. These stations employed 24,605 persons with a payroll of \$51,620,000.

Broadcast service to South America was improved by reason of the Commission requiring a minimum power of 50 kilowatts for international program service. A dozen international broadcast stations were in operation during 1940.

Increased use of radio for miscellaneous services was noted. Police licenses increased to 6300, the aviation service to over 2000, and more than 1000 stations were employed for forest conservation purposes. During the year the Commission clarified its rules with respect to the 452 special emergency stations, which are particularly useful in establish-

ing radio communication in time of flood, earthquake, hurricane, and other disaster when wire facilities are disrupted. The Commission rendered its final report on a special study of radio requirements to further insure safety to shipping on the Great Lakes and inland waters of the United States, and gathered information with respect to communications needs on the Mississippi River System.

A two-year investigation of chain broadcasting resulted in a special committee of the Commission, in June, recommending regulation of network practices to eliminate certain features while retaining the advantages of this type of service. This 1300-page report, together with briefs subsequently submitted by interested parties, was the subject of oral argument early in December in connection with consideration of the subject by the full Commission.

Commission regulation of interstate and foreign communication facilities brought added duties during the year as a result of national defense precautions. It was necessary for the Commission to augment its field force and monitoring facilities for more effective surveillance. In June it imposed a ban on amateur communication with foreign countries, supplementing this with an absolute prohibition on the use of portable long-distance transmitters. At the same time it warned ship radio operators to refrain from unnecessary conversation on the air. Subsequently, it ordered about 100,000 radio operators—commercial as well as amateur—to furnish proof of citizenship. The private wire and cable companies co-operated in compiling similar identification data with respect to employees engaged in handling international messages.

The year's record reveals 56,300 amateur stations in operation, as well as nearly 200 standard broadcast stations offering part-time programs in 30 foreign languages. Some 40,000 commercial operator licenses were issued during the year. As a convenience to those operators drafted or otherwise called to military service, certain renewal routine was waived temporarily. Due to war conditions, many disruptions of foreign cable and radiotelephone and radiotelegraph circuits were reported.

The role of all branches of communications in the preparedness program is to be co-ordinated by a Defense Communications Board, created by Executive Order in September. This Board comprises officials of the State, Treasury, War, and Navy departments and the Commission, with the various industries and other governmental departments concerned represented on advisory committees. It is a planning agency without operating or procurement functions. The Chairman of the Commission is also Board Chairman.

As a remedy for many ills in the highly competitive telegraph industry, the Commission early last year recommended merger of the domestic telegraph companies. It further urged consolidation of American international communication carriers serving the United States in the interests of defense and other national needs.

The Commission reported aggregate savings of \$10,000,000 to telephone users by reason of tariff revisions during the year, affecting all sections of the country. Common carriers filed a total of 23,330 tariff schedules affecting telephone and telegraph. In October the Commission approved a revised uniform system of accounts for telegraph and cable carriers, to become operative in 1942. The new system conforms to Government accounting

principles and will supplant one in use since 1914.

The present members of the Commission are James Lawrence Fly, Chairman; Paul A. Walker, Norman S. Case, T. A. M. Craven, George Henry Payne, and Frederick I. Thompson.

See RADIO; TELEVISION; UNITED STATES under Administration.

#### FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1940 it included most of the major Protestant denominations of the United States.

The total number of communicant members included in the Council's constituency in 1940 was slightly in excess of 22,000,000, counting only those 13 years of age and over.

Of the Council's eight departments, the following made a significant contribution during 1940. The department of social service conducted a series of conferences on preparation for marriage and family life; the department of evangelism directed the National Christian Mission in eleven major centers of population in the interest of a spiritual awakening. The department of international justice and good will held an interdenominational conference, February 27-29, in Philadelphia on the relation of the churches to the international crisis; it also carried on relief appeals in the churches for war sufferers in China and for German refugees. The radio department sponsored 10 religious programs on the air each week. The department of relations with churches abroad gave further leadership in the development of plans for a World Council of Churches. The department of research and education issued reports on "The Status of Women in Protestant Churches," "The Churches and the Social Security Act," "The Church and Cooperatives," "Civil Liberties in Industrial Disputes," "The War, the United States, and the Christian Churches," and "Sharecroppers and Migrant Workers." A commission for the study of Christian unity continued a plan for the unification of American interdenominational agencies and completed a study of unity in foreign missionary work. The department of race relations inaugurated a plan for improving the service of Negro rural churches in the South. The commission on army and navy chaplains enlarged its work to include a supervision of religious ministrations for the men called to training camps under the Selective Service Act. The *Federal Council Bulletin*, a monthly, continued to be issued as the official organ.

Officers during 1940 were: President, the Rev. George A. Buttrick; vice-president, Dr. John R. Mott; treasurer, Frank H. Mann; and general secretary, the Rev. Samuel McCrea Cavert. National offices are at 297 Fourth Avenue, New York City. An office is also maintained in the Woodward Building, Washington, D.C.

#### FEDERAL CROP INSURANCE CORPORATION (FCIC).

The Federal Crop Insurance Corporation, established as an agency of and within the U.S. Department of Agriculture under the Federal Crop Insurance Act, which was Title V of the Agricultural Adjustment Act of 1938, as approved Feb. 16, 1938, was authorized to insure growing wheat against all unavoidable hazards commencing with the crop planted for harvest in 1939. Almost 166,000 wheat growers in 31 States paid premiums for "all-risk" insurance on their 1939 crop; indemnities had been paid to 55,-

912 of these growers amounting to 10,163,127 bu. of wheat. In 1940, 379,420 wheat growers insured their crop paying 13,846,115 bu. of wheat or the cash equivalent for this protection. At the end of the year about 112,000 claims for indemnities had been paid with about 22,500,000 bu. of wheat or the cash equivalent. Acreage abandonment, which, in two of the largest wheat producing States in the nation, reached approximately 40 per cent, accounted for a big part of these indemnities. The fact such large acreages were abandoned in all-wheat country is evidence that a crop insurance program is vital to the wheat growing industry if its farmers are to have economic stability.

Recognition of this is found in the number of contracts written on the crop seeded in 1940 for harvest in 1941. On Nov. 30, 1940, about 380,000 contracts had been written on the 1941 crop, for which growers paid 12,721,511 bu. in premiums. These include winter wheat almost entirely. When all spring wheat contracts were tabulated after the final day of acceptance, Feb. 28, 1941, close to half a million contracts were written.

Crop insurance premiums and indemnities are computed entirely in terms of wheat, not dollars. For the sake of convenience, wheat growers may pay their premium with a warehouse receipt or cash equivalent representing the number of bu. as computed for the premium payment for the farm. Or the grower may charge the amount of the premium against future payments to be earned under the agricultural conservation program. Premiums paid in by growers are maintained by the Corporation in the form of actual wheat in storage. Indemnities are paid in wheat in the form of a warehouse receipt or in the cash equivalent thereof. The insured may indicate in his claim for indemnity whether he wishes the indemnity to be paid in wheat or in cash, but the Corporation reserves the right to make payment in a form other than that indicated by the insured.

Growers may insure 50 or 75 per cent of the past average yield for their farms. Premium rates and insurable yields are based on the actual or appraised loss and yield data for each individual farm over an established base period, adjusted to the average loss and yield data for the county in which the farm is located. Each year the yield and rate data of the second preceding year is worked into the rate structure so that yields and rates reflect actual productivity of the individual farms. Thus individual premiums and yields vary from year to year depending on production.

The crop insurance program is administered within States and counties by farmer committees, which permits direct contact with the wheat producer. Because the program contributes materially to the general welfare of the nation, the costs of administration, including costs of wheat-reserve storage and of research with a view to applying "all-risk" insurance to other crops, are paid from an annual Federal appropriation. For the crop year 1939 these costs amounted to \$4,800,000. The Corporation has an authorized capital stock of \$100,000,000 of which \$40,000,000 has been appropriated by the U.S. Government to operate as a revolving fund to meet losses in years of sub-normal wheat production when indemnities paid out may exceed premiums collected. It is expected that the amount drawn from its revolving fund during poor crop years will be recovered by the Corporation during years of good crops.

LEROY K. SMITH.

**FEDERAL FARM MORTGAGE CORPORATION.** See FARM CREDIT ADMINISTRATION.

**FEDERAL HOME LOAN BANK BOARD (FHLBB).** The Federal Home Loan Bank Board administers the following three agencies: (1) The Federal Home Loan Bank System, (2) The Federal Savings and Loan Insurance Corporation, (3) The Home Owners' Loan Corporation.

The Federal Home Loan Bank System, created in 1932, is composed of 12 regional Banks constituting a central reserve credit system for their member institutions. While the major portion of the membership in the System consists of institutions of the savings and loan type, a number of insurance companies and mutual savings banks are also members.

The Banks have obtained their funds, which may be advanced to member institutions on a long and short-term basis, from investments in their stock by their members and the U.S. Government, by deposits of member institutions, and through the sale of consolidated debentures. During the calendar year 1940, members increased their paid-in capital stock holdings in the Federal Home Loan Banks by \$3,562,700 to a total of \$44,540,650, which, with \$124,741,000 subscribed and paid-in by the U.S. Government prior to 1938, resulted in a total paid-in capital stock of \$169,281,650 on Dec. 31, 1940. There were \$90,500,000 of consolidated Federal Home Loan Bank debentures outstanding on Dec. 31, 1940, a 5- and a 17-month issue having been marketed in November, 1940, in amounts of \$15,000,000 and \$52,000,000 respectively, and \$25,000,000 retired at maturity on Dec. 1, 1940. Members' deposits declined \$2,695,293 during the year to a total of \$26,921,392.

Advances outstanding increased \$20,178,974 during 1940 to an all-time high of \$201,491,964 as of Dec. 31, 1940. Total advances made since the beginning of operations aggregated \$716,134,626. The Federal Home Loan Bank Board is authorized by law to charter Federal Savings and Loan Associations, of which the Banks' membership reflects a net increase of 39 during the year. As of Dec. 31, 1940, there were 1437 Federal associations and 2427 State-chartered institutions for a total membership of 3864 institutions, having estimated assets in excess of five billion dollars.

The Federal Savings and Loan Insurance Corporation, established in 1934 as an instrumentality of the United States, was, on Dec. 31, 1940, insuring the safety of investment to a maximum of \$5000 for each of 2,772,400 investors in 1438 Federal savings and loan associations with assets of \$1,872,691,000, and in 838 State-chartered institutions with assets of \$1,059,090,000. Each insured institution is required to pay an annual premium of one-eighth of 1 per cent of the total amount of all accounts of its insured members, plus its creditor obligations. On December 31 Corporation assets, consisting primarily of cash and obligations of, or guaranteed by, the United States, totaled \$128,014,722.54; surplus and reserves of \$26,449,196.18 had been added to the paid-in capital of \$100,000,000 provided for by the Congress.

The Corporation has authority to prevent the default of an insured institution and to restore an insured institution in default to normal operation by means of a loan or contribution to, or purchase of assets of, the association in difficulty. Since the beginning of the insurance program, the Corporation has found it expedient to assist 14 associations,

and in addition three associations have been placed in liquidation.

The Home Owners' Loan Corporation (HOLC), is a Government agency, created by Congress in 1933 to cope with the crisis in the home-financing field by refinancing the mortgages of distressed home owners. With a capital stock of \$200,000,000, fully paid for by the Secretary of the Treasury, it was authorized to issue bonds in an aggregate amount not exceeding \$4,750,000,000. As of Dec. 31, 1940, excluding those bonds called for retirement, the HOLC had a total of \$2,609,758,750 in bonds outstanding, all guaranteed by the U.S. Government as to both principal and interest.

The Corporation's lending authority lasted three years, until June, 1936. During this period, it loaned \$3,093,000,000 to 1,018,000 home owners threatened with foreclosure and unable to obtain private credit. The HOLC now is principally engaged in the collection of its loans and the liquidation of the properties it has been forced to acquire. As of Dec. 31, 1940, some 90,782 loans, amounting to \$216,449,558, had been paid in full. Of the remaining active original loans, 658,996, or 89.4 per cent, were current or less than three months in arrears; 28,727 others were in a liquidating class, meaning that such borrowers were meeting current bills and making regular monthly payments on their arrearages; some 49,752 others were still active, but in various stages of delinquency. In all, HOLC borrowers had repaid \$863,716,531 on their principal indebtedness. The Corporation had acquired and sold 125,529 properties; 51,722 others still remained on its books, the great majority rented pending sale.

The average HOLC borrower, at the time of refinancing, was delinquent two years in principal and interest and between two and three years in arrears on taxes. Borrowers' loans were reduced approximately \$200,000,000 in the refinancing transactions and they since have saved an estimated \$400,000,000 on interest charges alone. Excluding accounts paid in full, the average HOLC borrower's debt had been reduced 27.4 per cent at the end of 1940. The Corporation's personnel has been reduced 59.0 per cent since its peak; annual expenditures have been curtailed 38.5 per cent.

JOHN H. FAHEY.

**FEDERAL HOUSING ADMINISTRATION (FHA).** The Federal Housing Administration, established in June, 1934, pursuant to the terms of the National Housing Act, insures qualified lending institutions against loss on home mortgage or property improvement loans which conform to FHA requirements. The purpose of the FHA program, as defined by Congress, is "to encourage improvement in housing standards and conditions" and "to provide a system of mutual mortgage insurance."

During 1940, the activities of the FHA in the housing field attained the largest volume in its history. Loan insurance of all types written during the year totaled \$1,025,500,000 as compared with \$953,824,000 in 1939, the previous record year. By Dec. 31, 1940, the total amount of insurance written by the FHA since its formation was \$4,076,265,000. All of these funds were advanced by private lending institutions since the FHA itself lends no money.

About two-thirds of the FHA's operations involve the insurance of long-term mortgage loans on small homes. In 1940, applications for FHA in-

surance on home mortgages aggregated \$1,271,983,776 as compared with \$1,123,792,380 in 1939. Insurance was issued during the year on 168,300 small-home mortgages amounting to \$736,500,000, as compared with 153,747 mortgages aggregating \$660,416,000 in 1939. By Dec. 31, 1940, the FHA had insured 634,023 home mortgages totaling \$2,706,350,000.

In 1940, 78 per cent of the small-home mortgages selected for appraisal by the FHA involved new homes to be built under its inspection, as against 70 per cent in 1939 and 58 per cent in 1938. Construction was started or completed during 1940 under FHA inspection on slightly more than 164,000 new small homes. In 1939, 131,000 new homes were started under the FHA program. About 40 per cent of the new single-family homes built in 1940 were constructed under FHA inspection. The FHA program thus played an important role in the expansion in total residential construction to the highest levels since 1928.

Under Title I of the National Housing Act, the FHA insures short-term modernization and repair loans. A total of 662,948 loans of this type were insured during 1940 compared with 513,091 in 1939. In amount, last year's loans totaled \$276,500,000 compared with \$233,067,349 in 1939. Since the start of the FHA program, a total of 3,009,000 loans aggregating \$1,243,000,000 have been insured under Title I. Included in last year's total were about 9000 loans, not exceeding \$2500 each, to finance construction of new small homes in the lowest price brackets.

The FHA also insures mortgages on large-scale rental housing projects which conform to FHA requirements. In 1940, 48 such mortgages totaling \$12,481,000 were insured. Since the start of its program, the FHA has insured 317 rental housing mortgages in the amount of \$126,952,675.

The Federal Housing Administration's activities are carried on without cost to the Federal government. Its income, derived from insurance premiums, inspection fees, and other sources, substantially exceeds its operating expenses and insurance losses under Title II and results in large additions each year to its reserves against possible future losses. In 1940-41, the FHA's income will exceed its operating expenses and realized losses by about \$9,000,000. Charges against the FHA's insurance funds for losses realized on foreclosed homes turned over to the FHA have amounted thus far to only one-thirtieth of 1 per cent of the total mortgage insurance written. See ARCHITECTURE.

**FEDERAL LAND BANKS.** See FARM CREDIT ADMINISTRATION.

**FEDERAL LOAN AGENCY.** An agency of the United States government under which are grouped those agencies established for the purpose of stimulating and stabilizing the financial, commercial, and industrial enterprises of the nation. The component agencies are: Disaster Loan Corporation (q.v.); Electric Home and Farm Authority (see ELECTRIC LIGHT AND POWER); Export-Import Bank of Washington (q.v.); Federal Home Loan Bank Board (q.v.); Federal Housing Administration (q.v.); Federal National Mortgage Association; Reconstruction Finance Corporation (q.v.). Administrator in 1940: Jesse H. Jones.

**FEDERAL PRISON INDUSTRIES, INC.** See PRISONS, PAROLE, AND CRIME.

**FEDERAL RESERVE SYSTEM.** See **BANKS AND BANKING.**

**FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION.** See **FEDERAL HOME LOAN BANK BOARD.**

**FEDERAL SECURITY AGENCY.** An agency of the United States government under which are grouped those agencies whose major purposes are to promote social and economic security, educational opportunity, and the health of the citizens. The component agencies are discussed in the following separate articles: **CIVILIAN CONSERVATION CORPS; EDUCATION, OFFICE OF; FOOD AND DRUG ADMINISTRATION; NATIONAL YOUTH ADMINISTRATION; PUBLIC HEALTH SERVICE; SOCIAL SECURITY BOARD.** Administrator in 1940: Paul V. McNutt.

**FEDERAL SURPLUS COMMODITIES CORPORATION (FSCC).** See **SURPLUS MARKETING ADMINISTRATION;** also, **DISASTER LOAN CORPORATION.**

**FEDERAL TRADE COMMISSION (FTC).** The Federal Trade Commission was created in 1914 by an Act of Congress, as a result of general public demand for legislation to curb monopolistic and other unfair trade practices. In promoting the basic public policies of the laws which it administers, the functions of the Commission can be divided into two general classes. One is remedial or corrective, and the other may be described as fact-finding and advisory in character. In connection with its corrective or remedial functions, the Commission is invested with quasi-judicial powers to prohibit parties from using unfair methods of competition and unfair and deceptive acts and practices in interstate commerce, and also, under carefully specified conditions, from using certain other practices, including price discrimination, exclusive dealing arrangements, and acquisition of stock in competing corporations.

Corrective proceedings by the Commission may be either initiated by the Commission on its own motion or by a complaint by a member of the public. The identity of complainants is kept confidential by the Commission. Radio and periodical advertising is subject to constant review by members of the Commission's staff. For illustration, during the calendar year of 1940 the Commission's Radio and Periodical Division examined 759,218 commercial radio continuities and 367,041 advertisements in newspapers, magazines, etc. In order that corrective proceedings by the Commission may be conducted efficiently, the Commission's investigatory powers are implemented by the power of subpoena. The formal procedure of the Commission embodies the general principles of adversary litigation and also of appellate court review. The Supreme Court has accepted the Commission procedure as being fully in accord with the constitutional functioning of administrative agencies.

The formal corrective action by the Commission consists in the issuance of a complaint after an investigation has been made and the Commission has found that a proceeding in the matter would be in the public interest. If the evidence taken in the case sustains the allegations of the complaint, the Commission issues its findings as to the facts and order to cease and desist. The respondent may, within sixty days after service of the order, appeal therefrom to a United States Circuit Court of Appeals. If a respondent violates an order issued under the Federal Trade Commission Act, after such order has become final, he is subject to a civil pen-

alty of not more than \$5000 for each violation. The Commission may also obtain temporary court injunctions, pending completion of formal proceedings by the Commission, against sellers who falsely advertise foods, drugs, cosmetics, or devices. The Commission during the calendar year of 1940 issued 460 complaints and 292 orders to cease and desist. As an illustration of the constantly expanding case work of the Commission, 300 complaints were issued during the calendar year of 1939.

In addition to its formal remedial procedure, the Commission has two important informal methods of promoting its statutory remedial objectives. Certain types of cases, mainly involving false and misleading advertising, may be disposed of by stipulation. Under this procedure, if the advertiser admits that certain representations are incorrect, he is given the opportunity to sign a stipulation in which he agrees to discontinue using such misrepresentations. The privilege of stipulation is not extended in cases involving fraud, dangerous drugs, or other unusual conditions. During the calendar year of 1940 the Commission accepted 594 stipulations to cease and desist as compared to 470 accepted during the calendar year of 1939.

Another informal method used by the Commission in furtherance of its statutory remedial objectives is the trade practice conference. Under the supervision of the Commission and after notice of public hearing, and subject to final approval or acceptance by the Commission, members of industry may voluntarily adopt trade practice rules condemning unfair practices and promoting ethical practices.

The Commission is authorized and directed under the Wool Products Labeling Act of 1939 to issue rules and regulations for the information and guidance of members of industry, consumers, and the general public as to the minimum requirements for labeling wool products.

The functions of the Commission which are fact finding and advisory are designed to place at the service of Congress, the President, the courts, and the general public the expert knowledge and skill acquired by the Commission and its staff in ascertaining and analyzing the facts regarding industry and in recommending remedies for evils disclosed. During the calendar year of 1940 reports were released as to the corporations producing and selling the following articles: cigarettes and tobacco, aircraft, bread and bakery products, biscuits and crackers, food specialties, beet and cane sugar, corn products, agricultural machinery and tractors, automobile parts and accessories, glass and glassware, rubber products, motor vehicles, railroad equipment, lead and zinc products, coke-oven products, steel castings, machine tools, clay products, heating and cooking apparatus, domestic laundry equipment, and rayon and allied products. These reports covered 159 different corporations, the total annual sales of which amounted to approximately 8½ billion dollars.

The Commission is represented on the Temporary National Economic Committee, which was created by Congressional resolution. The Commission was originally assigned the basic tasks of studying monopolistic practices in American industry. Among the data submitted to the Committee by the Commission in connection with its studies are reports on the following subjects: Relative Efficiency of Large, Medium-sized and Small Business, History of the Pennsylvania-Dixie Cement Merger, History of the Bethlehem Steel

**Merger, Natural Gas and Natural Gas Pipe Lines in the United States, Operation of the Export Trade Act 1918-40 (Webb-Pomerene Law), Rates of Return on Invested Capital in the Rayon, Tobacco, Iron and Steel, Cement, and Farm Machinery Industries, Trade Practice Conference work of the Commission, Practices in the Agricultural Implement and Farm Machinery Industries, Monopolistic Practices in Industries, Monopoly and Competition in Steel, Concentration of Control Over Sales and Distribution of Milk and Dairy Products, and A Survey of Controversial Marketing Practices in the Petroleum Products Industry.** See BIRTH CONTROL.

EWIN L. DAVIS.

**FEDERAL WORKS AGENCY.** An agency of the United States government under which are grouped those agencies dealing with public works and administering Federal grants and loans for the purposes of construction. The component agencies are: Federal Fire Council; Public Buildings Administration (q.v.); Federal Real Estate Board; Public Roads Administration; Public Works Administration (q.v.); Housing Authority, U.S. (q.v.); and Work Projects Administration (q.v.). Administrator in 1940: John M. Carmody.

**FEDERATED CHURCHES.** A name given to churches made up of two or more denominational organizations united for local purposes only. See RELIGIOUS ORGANIZATIONS.

**FEDERATED MALAY STATES.** See BRITISH MALAYA.

**FEEDS.** See DAIRYING; LIVESTOCK; POULTRY; VETERINARY MEDICINE under *Toxicology*.

**FENCING.** The art of sticking your fellow human being with the point of a sword was refined by some degrees during 1940, and though there were frequent eliminations of adversaries, none of them were permanently dispatched. The veterans had the field more or less to themselves, with Fred Seibert of the Lake Shore A. C. in Chicago comprising the lone successful newcomer in the ranks of the champions. He grabbed the national épée title by defeating Alfred Skrobisch of the Fencers Club, 3 to 1, in a fence-off after each had won six of eight tests in the regular round-robin.

The national foil tourney saw Dernel Every of the New York A. C. regain the laurels he had won in 1938. He found it comparatively easy to dethrone Norman Lewis, the Salle Santelli youngster who surprised the fencing world in 1939 by winning the crown. But Lewis did not yield without a desperate fight.

The national saber title continued in the hands of Norman Armitage of the Fencers Club. It was the sixth time since 1930 that Armitage won the crown.

In the national three-weapon tournament, John C. Huffman of the New York A. C. took first honors.

The champion team in both the national épée and foil events was the Salle Santelli, with José de Capriles, Diaz Cetrulo, Lewis, and Albert Axelrod, a substitute, capturing the foil title for the club for the third straight time. José de Capriles, his brother Miguel, and Lewis made up the victorious épée combination.

In the realm of swordswomen, Miss Helena Mroczkowska, former intercollegiate foil queen, succeeded to the national championship in the absence of Miss Helene Mayer, the winner in 1939. The Salle Santelli put an end to the 10-year reign

of the Salle d'Armes Vince as foil team titleholder.

With one of the strongest squads in its history, New York University carried off five of the seven titles at the major men's tourney. Silvio Giolito was supreme in foil, Frank Scharfstein in saber and Arthur Tauber in épée. Army won the saber and Princeton the épée crowns.

Hunter College dominated the women's intercollegiates, with Miss Maria Cerra taking the individual honor.

**FERNANDO PO.** See SPAIN under *Colonial Empire*.

**FERTILIZERS.** The Bureau of Plant Industry of the U.S. Department of Agriculture has as its principal functions the investigations of soils, fertilizers, and plants. In its reports for the year 1939-40 the Bureau summarized the outstanding results of fertilizer research in part as follows.

**Source of Magnesium.** Magnesium is required by plants for their normal development, in quantities only slightly less than the requirements for nitrogen, phosphorus, and potassium. Heretofore calcined kieserite has been imported from Germany and incorporated in mixed fertilizers to supply them with water-soluble magnesium. At the outbreak of the present war in Europe importations ceased and the finding of a substitute became highly desirable. Investigation showed that some domestically produced magnesium oxide, although water-insoluble, was largely converted in mixed fertilizers into water-soluble forms and, with simple precautions, undesirable reactions that diminished the plant food content of nitrogen and phosphorus could be avoided. The use of magnesium oxide in mixed fertilizers also improved the physical condition of the fertilizers.

**Granulation of Superphosphate.** Though the advantages obtained by granulating a fertilizer material are fewer than those accruing from similar treatment of a mixed fertilizer, the decrease in tendency to cake, the improvement of the drilling qualities, and the prevention of losses as dust during application to the soil on windy days make the production of granulated superphosphate desirable. Experiments under conditions similar to those in the factory showed that fresh superphosphate as taken from the dens used in its manufacture can be granulated by regulation of the temperature of the material in the granulator rather than by the addition of water during granulation. By this procedure the troublesome tendency of the superphosphate to adhere to the granulator walls is greatly reduced, the expense of removal of added water is eliminated, and a uniform product of any desired size, density, and hardness of granules is obtained.

**The Caking Tendency.** An annoyance often experienced by manufacturers and consumers of fertilizers is that of finding that the material in a pile or bag has consolidated into a large, compact, hard mass or cake, which, before it can be used, must be crushed or ground. The formation of these cakes is most frequent and most pronounced with certain fertilizer materials, such as urea, ammonium nitrate, and calcium nitrate, that are prone to absorb moisture from the air. Studies have shown that treatment of these materials with ammonia under moderate pressure in the presence of a small quantity of inert mineral matter or organic powder renders them highly resistant to caking even when stored under conditions of high atmospheric humidity.

**Soil Fertility Investigations.** In experiments on strawberry soils, standard analysis fertilizer

(5-8-6) compounded with inorganic and insoluble organic nitrogen gave no better plant growth or yield of strawberries than when equivalent amounts of plant food per acre were applied in a higher analysis fertilizer (7.5-12-9) containing the same nitrogen materials. The higher analysis fertilizer is advantageous to handle on the farm, and less labor is required for its application to crops. Equivalent amounts of plant food in the higher analysis fertilizer cost about 12 per cent less than in the standard analysis fertilizer. Application of fertilizer to strawberries in the fall and early winter results in better plant growth and more abundant fruiting than late winter.

The practice of neutralizing fertilizers with dolomitic limestone for crops in the southeastern truck-crop belt has proved advantageous. The inclusion of dolomitic limestone assures adequate amounts of nutrient calcium and magnesium and prevents soil deterioration by increased acidity. It also increases efficiency of low-cost ammonia sources of nitrogen and has made possible their substitution for the more expensive organic materials. In recent years cotton fertilizers have been formulated neutral by including substantial quantities of dolomitic limestone in the mixture. In experiments begun in 1937 in the Southeastern States, data on many soil types indicate that neutralizing the fertilizer with dolomitic limestone does not affect the response of the crop or the soil requirement for potash fertilization. Neutralizing the fertilizer in this way produced essentially the same increase in yield regardless of the potash content of the fertilizer.

Chemical analyses of the leaves and root bark of cotton plants showed highly significant differences in composition due to fertilizer application to the soil. The higher the nitrogen content of the root bark of the cotton plants grown under conditions of high-nitrogen fertilizers, the less cotton was killed from root rot, indicating that some organic-nitrogen compound in the root bark is inhibitive to the development of the root rot fungus.

Studies of a prolific variety of pecan trees over a four-year period showed that most soils used for pecan growing in the Southeastern States and in many of the South Central States respond to fertilizer application in pecan production. Experiments with sugar beets in the Platte River valley of Nebraska have shown an increase of as much as 5 tons of beets per acre from the use of 40 lb. of nitrogen as sulfate of ammonia, while 12 tons of manure gave only about 3.5 tons per acre increase over the unfertilized sugar beets. Domestic muriate of potash was found to be as satisfactory as the higher-priced sulfate shipped in from abroad. Such findings should tend to allay any apprehension concerning the use of potash produced in the United States.

See CO-OPERATIVE MOVEMENT; FARM MACHINERY AND EQUIPMENT; MAGNESIUM; POTASH; TENNESSEE VALLEY AUTHORITY.

**FESTIVALS.** See MUSIC.

**FHA.** See FEDERAL HOUSING ADMINISTRATION.

**FHLBB.** See FEDERAL HOME LOAN BANK BOARD.

**FIFTH COLUMN.** A term for elements within a nation or group who sympathize with and aid an enemy nation or group. The term originated during the Spanish civil war when Gen. Emilio Mola, marching with four Nationalist columns against the Loyalist Government in Madrid in 1936, was asked which column would capture

the city. He replied "the fifth column," meaning the Nationalist sympathizers in the capital.

The designation gained wide currency during 1940 as a result of the effective aid rendered German armed forces by pro-Nazi elements in Denmark, Norway, the Netherlands, Belgium, Luxembourg, and France when Hitler invaded each of those countries. Pro-German "fifth columns" were active also in supporting the German Fuehrer diplomatically, economically, and otherwise and in demoralizing his opponents in most of the other countries of the world, especially Sweden, Hungary, Rumania, Yugoslavia, Switzerland, Great Britain, the United States, and many of the Latin American countries. See each of these countries under *History*.

The British Labor party, in an official pamphlet published in 1940, referred to the Communist Party in Great Britain as the "sixth column operating abroad on behalf of the Soviet imperialism and power politics." In the United States, the term "sixth column" was frequently used to designate an organization or group formed to fight "fifth column" elements.

Along with "fifth column" activities, Hitler employed a modern variety of the Trojan horse stratagem described in Homer's poems, particularly in the surprise attack upon Norway. German soldiers with full military equipment were hidden in the holds of ore vessels and other merchant ships and sent into the chief Norwegian ports to await the signal for the attack.

**FIJI.** A British crown colony in the southwestern Pacific, comprising some 250 islands (80 inhabited) and its dependency—the islands of Rotuma. Total area, 7083 square miles; total population (Jan. 1, 1939), 210,518. Capital, Suva. Sugar, copra, bananas, pineapples, native food-stuffs, and gold constitute the chief products. Various timbers are produced from the forests. Trade (1939): imports, £1,625,054; exports, £2,746,207 (sugar, £1,425,704; gold, £928,128). Finance (1938): revenue, £889,514; expenditure, £966,957; public debt (December 31), £1,574,692. The governor is assisted by an executive council. There is a legislative council consisting of 32 members including the governor as president. Governor of Fiji and High Commissioner for the Western Pacific, Sir Harry Charles Luke (appointed June 26, 1938).

**History.** The Native Lands Trust Bill was passed by the legislative council during the first half of 1940. This measure underlines the position of the government as trustees of the land for the Fijian people; improves the position of the native owners and ensures the equal development of all the land and not merely of favored sections; and makes proper provision for permanent native reserves. Compulsory military training for all men of European descent between the ages of 18 and 36 was introduced during the year. The Defense Force had Fijian and Indian units in which volunteers were enrolled.

**FINANCIAL REVIEW.** Finance, both within the United States and abroad, was profoundly influenced by the spectacular military events in Europe during the spring of 1940, the outcome of

which was the establishment of the hegemony of Germany over most of the continent of Europe. International financial dealings were greatly contracted as a result of this development, while the consequent intensive armament program in the United States and the establishment of a virtual military alliance between the United States and the British Empire had important financial repercussions within this country.

Several of the major financial developments of the year constituted merely an intensification of trends that had been fully apparent previously. Imports of gold into the United States reached a new high level, as continental European countries sought to shift their hoards of yellow metal across the Atlantic before the arrival of the invader and British Empire countries sold gold freely to pay for their large wartime purchases of goods from the United States. Ever mounting gold reserves produced a further expansion of bank deposits, and a decline in interest rates in the United States to new low record levels. Activity on American financial markets contracted, in view of the new profound uncertainties created by the European situation. The turnover on the New York Stock Exchange during 1940 was the lowest for any year since 1921.

At the same time, a number of new financial problems came to the fore. The occupation of a number of countries in western Europe by Germany led to the issuance of Treasury orders freezing assets owned by nationals of occupied countries, in order to assure that such resources would not be taken over by force for the benefit of the invader. Cash and other assets covered by these freezing orders could be obtained by their owners only through application to the Treasury and the issue of licenses. Serious thought was being given toward the end of the year to a more inclusive freezing order that would tie up German and Italian balances also, as part of the program of co-operating with Great Britain. In fact, imposition of a fully developed foreign exchange control system to implement the aid to Britain program was discussed in official circles.

The gradual exhaustion of Great Britain's dollar resources created a far more serious financial problem, but its solution was deferred for the new Congress which convened Jan. 3, 1941.

**Security Markets.** Stock prices fluctuated within a narrow range during the first four months of the year, when business activity was declining in this country from the high level of the early war months and the conflict on the western front appeared to be a complete stalemate. Germany's successful invasion of Norway made for nervousness in the markets, but the sweep across the Low Countries and the collapse of France caused a very sharp decline during May and June, which carried share prices down to the lowest level since the depression of 1938. The imminent end of the war with a British defeat was widely awaited in the early summer. The end of the war in itself was expected to usher in a period of reduced business activity and lower commodity prices, but a victory for Germany promised to produce a number of new problems, economic and financial, that held out serious threats to American export trade and even the military safety of the western hemisphere. When it became apparent that the British Empire was going to carry on the war alone with some chance of success, however, and that the United States was going to embark forthwith upon a huge

armament program of its own, security prices recovered and by the end of August approximately one-half of the losses in the decline of May and June had been regained. Apart from a flurry of strength in public utility stocks, followed by a subsequent severe decline, the Presidential elections in November did not affect the markets materially. The re-election of President Roosevelt was not followed by any such extended advance as occurred after the 1936 election, since inflation fears because of heavy Treasury spending had failed to materialize on earlier occasions. Stock prices during the final four months of the year again remained within a narrow range, about midway between that of the beginning of the year and the June lows.

The rapid rise in industrial activity during the final months of the year was not reflected to any material extent in the movement of stock prices. One reason for this was the gravity of the European situation, and the caution among investors about bidding prices up at a time when military developments might precipitate a repetition of what happened in May and June, 1940. The enactment of two major revenue acts raising taxes on corporate incomes and establishing an excess profits tax was another influence which neutralized the very favorable business reports. Furthermore, Government resistance to commodity price increases promised to narrow profit margins for many concerns, since taxes and to a lesser extent wages were tending upward.

The highs and lows of the *New York Times* stock price averages during each month of 1940 were as follows:

NEW YORK TIMES STOCK MARKET AVERAGE, 1940  
[50 Stocks—25 Rails and 25 Industrials]

Month	High	Low	Last
January	111 78	104 69	106 44
February	109 22	105 40	107 24
March	109 01	106 22	108 46
April	111 18	107 19	108 59
May	108 60	82 87	86 59
June	92 11	82 32	90 20
July	93 26	88 99	92 69
August	94 65	89 23	94 40
September	98 93	93 43	97 53
October	100 19	94 95	98 02
November	99 69	92 48	93 66
December	95 22	91 68	93 82

While the general level of stock prices did not fluctuate widely during the final months of the year, there were substantial price movements in diverse directions among major groups of issues. Aircraft, steel, and other groups that directly reflected the armament boom were firm to strong. On the other hand, issues of consumer-goods manufacturing concerns were adversely affected by the fact that, while the volume of their business was not greatly influenced by national defense, their taxes rose sharply. Food and tobacco manufacturing concerns and the public utilities were examples of issues that were regarded as being adversely affected on balance by national defense. Railroad securities were among the strongest groups because, while enjoying an increase in traffic due to national defense, the railway companies fared better than others from the tax viewpoint owing to their heavy fixed charges and their extensive capital investment, which gave a high base from which excess profits could be figured.

The high, low, and closing prices of the more active stocks listed on the New York Exchange, during 1940, were as follows:

## PRICES OF THE MOST ACTIVE STOCKS, 1940

Stock	High	Low	Close
U.S. Steel....	76½ Nov. 9	42 May 21	69½
Loft.....	39¼ Apr. 8	15½ May 21	17½
Curtiss-Wright	11¼ Mar. 8	6½ July 25	9½
General Motors	56½ Apr. 8	37½ May 28	48
Republic Steel	24½ Nov. 9	14 May 21	22½
International Paper			
& Power	21¼ May 3	10½ May 21	14½
N.Y. Central	18¼ Jan. 3	9½ May 21	13½
Anaconda	32 Apr. 9	18 May 21	26½
Bethlehem Steel	93¼ Nov. 9	63½ May 23	86½
Lockheed	41¼ Apr. 15	22½ July 3	27½
General Electric	41 Jan. 2	26½ May 21	33½
United Air Lines	23½ Apr. 4	12 May 21	16

The turnover on the New York Stock Exchange during 1940 aggregated 207,599,749 shares, which compared with 262,029,599 shares in 1939. Sales of bonds on the Exchange also declined to the lowest level in more than twenty years, aggregating \$1,669,438,000 which compared with \$2,046,083,000 in 1939. The total value of all listed stocks on Dec. 30, 1940, was \$41,890,646,959, which compared with \$46,467,613,372 the year before.

High grade bond prices were reactionary in May and June, when stocks declined sharply, but the recession in bond quotations was relatively mild. In the closing months of the year, with excess reserves at new high levels and the supply of new bonds quite limited, a brisk advance occurred which brought yields of gilt-edge obligations down to the lowest recorded level. Government and other tax-exempt bonds were especially strong because of the proposal of Secretary of the Treasury Morgenthau that Congress enact legislation to make future issues of such obligations taxable. The Treasury Department reported that the average yield of all Federal obligations with maturity or call dates twelve years or more away was 1.89 per cent in December, 1940, as compared with 2.35 per cent in December, 1939. The yield on five high grade corporate bonds fell within this period from 2.86 per cent to 2.59 per cent. The greatly widened spread between yields of Treasury and corporate obligations reflected the prospective diminution of the supply of tax-exempts through legislation.

Middle grade and speculative bonds fluctuated with stock prices, but showed greater strength later in the year than stocks. The reason for this was chiefly the more favorable position of lower grade bonds under the tax laws, since earnings used to pay bond interest are not subject to income and excess profits taxation.

The course of corporate bond prices, as measured by indices of the Standard Statistics Company, was as follows:

## AVERAGES OF BOND PRICES

	Total	Corporate	Railroad	Utility
Number of issues	60	20	20	20
1940—January	82.4	87.3	58.2	101.8
February	82.2	87.3	57.8	101.6
March	82.1	87.3	57.2	101.8
April	82.5	87.5	58.2	101.7
May	79.4	85.3	53.5	99.3
June	78.5	84.7	52.0	98.7
July	81.2	86.3	57.1	100.2
August	81.5	86.8	57.5	100.2
September	82.7	87.8	59.7	100.6
October	81.6	89.2	61.0	100.6
November	83.9	90.3	60.9	100.5
December	84.0	90.2	61.1	100.7

**Financial Regulation.** The Securities and Exchange Commission pursued without remission its

policy of extending and tightening Federal regulation of finance. The most important new legislation in this field during the year was the Investment Company Act of 1940 requiring investment trusts of most types to register with the Securities and Exchange Commission, which thus acquired broad regulatory control over such concerns. Registration of investment trusts was effected by the end of the year, and the SEC issued a number of regulations under its new powers. Title II of the Investment Company Act, known as the Investment Advisers Act of 1940, gave the SEC authority to supervise investment counsel and investment management organizations. Registration of concerns and individuals engaged in this field was also effected.

The SEC proceeded more vigorously to enforce the integration and simplification provisions of the Public Utility Holding Company Act of 1935. A number of hearings were held in the course of the year on orders issued by the Commission designed to compel many of the public utility holding companies to dispose of non-integrated properties and to simplify their capital and corporate structures. The staff of the SEC proposed late in the year that registered public utility holding companies and their subsidiaries be required to sell new bond issues through competitive bidding, rather than by negotiation with regular investment banker connections. This was proposed in order to carry out the injunction contained in the law that "arms-length bargaining" be enforced as between the issuer and the underwriter, where registered public utilities undertook new financing. The SEC itself, however, did not adopt this proposal immediately, but called for hearings to begin in 1941.

Another indication of the expansion of the scope of financial regulation was the action of the SEC in calling upon the New York Stock Exchange not to enforce its rule barring "multiple trading," or the making of markets on other stock exchanges for securities listed on the New York Stock Exchange by member firms of the latter. Where New York Stock Exchange members acted as odd-lot dealers or specialists on exchanges in other cities, it was felt that business was being diverted from New York at a time when the turnover had already shrunk to alarmingly small proportions.

In one respect, however, financial regulation was relaxed. Congress amended the Securities Act of 1933 to permit the SEC to waive the 20-day compulsory waiting period before registration statements for new security issues could become effective. As a result, a number of high grade issues were sold within a few days after registration statements for them had been filed with the SEC. Conferences were held between members of the SEC staff and representatives of the stock exchanges, the Investment Bankers' Association and the National Association of Securities Dealers, with a view to the improvement of regulatory legislation and methods. These conferences had failed to produce any results, however, by the end of the year, and there were evidences of wide divergences of opinion as to desirable changes in the securities laws and regulatory policies.

**New Financing.** The bulk of new financing during 1940 was once again for refunding purposes, the decline in interest rates causing many corporations to replace outstanding bond issues with new lower-coupon obligations. Public financing to raise new capital was still relatively small in amount, as may be seen from the following table:

## NEW PUBLIC FINANCING, 1940

[Thousands of dollars]

Month	Total	New Capital	Refunding
January .....	173,465	35,470	137,995
February .....	257,346	46,004	211,342
March .....	134,327	30,527	103,799

December .....	389,343	61,132	328,212

Source: *The Commercial and Financial Chronicle*.

The Federal Government in 1940 raised \$1,212,000,000 through the sale of bond and note issues, and sold \$1,722,000,000 of its obligations for refunding purposes. Of the securities sold to raise new money, \$531,000,000 issued on December 18 represented the initial sale of notes for national defense, authorized by special legislation, which may have a maturity up to five years. These notes

As in the previous year, a large proportion of new securities sales consisted of private placements with one or a few insurance companies or banks. Investment bankers charged that the ability of the issuer to escape the registration requirements was the chief reason for the sustained popularity of these private sales, which tended to eliminate the investment banking profession from its basic role of raising capital for industry. SEC spokesmen ascribed the favor for private placements to the great surplus of capital seeking investment in institutional hands. A number of banks made term loans to corporations which used such funds to pay for bond issues held by the public. Owing to the thin markets on the New York Stock Exchange, there were also a number of public offerings by groups of dealers of blocks of already outstanding stocks at fixed prices, constituting so-called "secondary distributions." Many of these were for British account, representing holdings of British investors taken over and liquidated by the Government there to realize foreign exchange. Others were for the account of large domestic holders.

## SUMMARY OF NEW FINANCING

[In millions of dollars]

Year	Total (New and refunding)	Total new capital	Total domestic	New Capital State and municipal	Federal agencies	Corporate Bonds & notes	Stocks	Foreign*	Total refunding
1928 .....	9,992	8,114	6,789	1,379	64	2,385	2,961	1,325	1,877

\* Includes issues of noncontiguous U.S. Territories and Possessions. \* Includes publicly offered issues of Federal land banks, Federal intermediate credit banks, Federal Farm Mortgage Corporation, and Home Owners' Loan Corporation; excludes direct obligations of U.S. Treasury. \* Figures do not include funds obtained by States and municipalities from any agency of the Federal government.

bore a coupon of  $\frac{3}{4}$  of 1 per cent. The Federal Government also raised \$985,000,000 during the calendar year through the sale of United States savings bonds. Government credit agencies did little financing during the year, the Commodity Credit Corporation (q.v.) selling \$289,000,000 of short term notes for cash to finance the increasing volume of crop loans which it made for the Government, while the United States Housing Authority (q.v.) sold \$112,000,000 of one-year notes with a coupon of  $\frac{3}{4}$  of 1 per cent, to finance the construction of slum clearance projects, the cost of which was to be financed later through the sale of long term bonds on the completion of these developments.

**International Capital Movements.** The war in Europe accelerated the flow of funds from other countries to the United States, and gold imports for the year amounted to \$4,745,000,000, the highest figure ever attained. This total is larger than the entire monetary gold stock of the United States before 1933. Enormous shipments of gold during the spring and summer, in part via Canada, largely exhausted European monetary gold stocks, and by the close of the year such shipments tapered off, and henceforth will have to conform more closely to the amount of new gold production. The chief sources of gold imported by the United States during 1940, and comparisons with preceding years, were as follows:

## GOLD MOVEMENT TO AND FROM THE UNITED STATES

[In million dollars at \$35 per ounce]

Calendar year	Total net imports or net exports (—)	United Kingdom	France	Netherlands	Switzerland	Canada	Japan	Belgium	British India	Australia	All Other

• Inflow less than \$50,000.

A substantial portion of the gold imported during the year was held here earmarked for foreign account, particularly for France, Holland, Belgium, and other countries occupied by Germany, the metal being frozen under the Treasury's orders and subject to release only under license. Earmarked

## DRAIN ON GOLD AND DOLLAR RESOURCES OF BRITISH EMPIRE, EXCLUDING CANADA AND NEWFOUNDLAND

[From Sept. 1, 1939, to Dec. 31, 1940]

Gold and Dollar Expenditures (In Millions of U.S. Dollars)			
A. Payments to the United States by United Kingdom.			
1 On British Government orders in the United States		\$1,380	
Goods delivered . . . . .	\$660		
Advanced payments . . . . .	570		
Capital assistance . . . . .	150		
2 For other merchandise imports from the United States		705	
3 For shipping, interest, etc . . . . .		197	\$2,282
B Payments to the United States by Empire countries, excluding U.K. and Canada			
1 For commodity imports . . . . .		435	
2 For shipping, interest, etc. . . . .		48	483
C Payments by Empire countries, excluding Canada, to areas outside the U.S. requiring gold or dollars			
1 Payments by Empire countries (chiefly U.K.) to areas outside the U.S. and Canada requiring gold or dollars . . . . .		550	
2 Gold payments by Empire countries to Canada and Newfoundland (net) . . . . .		225	775
D. Withdrawal of Capital			
1 By American and others, through sale of free sterling to American importers . . . . .		300	
2 By repayment of outstanding export credits as required by our Neutrality Act . . . . .		200	
3 By liquidation of forward exchange position in dollars . . . . .		235	735
E. Residual—Miscellaneous items and errors of estimation . . . . .			
			71
Total gold and dollar requirements for all transactions . . . . .		\$4,346	

Gold and Dollar Receipts			
A. Receipts from United States by United Kingdom.			
1 From merchandise exports . . . . .	\$ 205		
2 From interest, shipping, etc. . . . .	140	345	
B. Receipts from United States by Empire countries, excluding U.K. and Canada			
1 From merchandise exports . . . . .	640		
2 From tourist travel, remittances, etc. (net) . . . . .	30	670	
C. Dollar receipts by Empire countries, excluding Canada, from areas outside the U.S. . . . .			
			50
D. Receipts from sale of Empire gold (new production and disbanding) . . . . .			
			965
Total gold and dollar receipts by Empire countries, excluding Canada . . . . .		\$2,030	
Total drain on gold and dollar resources of British Empire, excluding Canada and Newfoundland, Sept. 1, 1939 to Dec. 31, 1940 . . . . .		\$2,316	

gold in this country at the end of 1940 aggregated some \$1,800,000,000. These stocks of the yellow metal are not included with the monetary gold stock of the country, which aggregated \$21,994,500,000 at the end of 1940. See MONEY.

The Treasury's statistics of capital movements into the United States reflected the gradual liquidation of British holdings of American securities during the year, but showed increases in the resources held here for the account of nationals of France and a number of other European countries, due to the last-minute transfer of funds to the United States before these nations were occupied. Capital movements during the first ten months of 1940, and comparable statistics for the preceding five years, are tabulated at the top of this page.

These Treasury statistics, however, failed to reflect fully the extent to which Great Britain liquidated her dollar resources in order to pay for imports from the United States and to make advance payments to American manufacturers on contracts calling for the production and delivery of huge amounts of aircraft and other war materials. More precise data on the extent of British liquidation of gold and dollar resources were disclosed shortly after the turn of the year by Secretary of the Treasury Morgenthau, who made public data (see column 1) received from the British Treasury.

These figures indicate the extent to which the dollar resources built up in this country by the persistent transfer of capital to the United States by European nationals before and after the outbreak of the present war is being used up to pay for wartime purchases of armaments. As during the World War, the United States in wartime finds it easy to redeem large investments made in this country by Europeans under peacetime conditions. On balance, therefore, this country will be a creditor nation to a much larger extent after the war than before, wholly apart from loans and leases of war materials to Great Britain and her allies. **FINE ARTS.** See ART; DRAMA; LITERATURE; MUSIC; PAINTING; PRINTS; SCULPTURE.

**FINGERPRINTS.** See COURTS under *Admissibility*; FEDERAL BUREAU OF INVESTIGATION; IMMIGRATION, EMIGRATION, AND NATURALIZATION.

**FINLAND.** A republic of Northern Europe. Capital, Helsinki (Helsingfors).

**Area and Population.** Finland had an area of 147,811 square miles at the beginning of 1940, which was reduced to 134,253 square miles by the cession of 13,558 square miles to the Soviet Union under the Treaty of Moscow of Mar. 12, 1940. The population on Jan. 1, 1939, was estimated at

3,659,000. The cession of land to Soviet Russia did not involve a concomitant decrease in the population of Finland, for the great bulk of the inhabitants in the disputed territory were evacuated to Finland before the Russian occupation. About 90 per cent of the people speak Finnish, and most of the remainder speak Swedish. Living births in 1938 numbered 76,695 (21.0 per 1000); deaths, 47,901 (13.1 per 1000). Estimated populations of the chief cities in 1937 were: Helsinki (Helsingfors), 293,237; Viipuri (Viborg), ceded to Russia, 73,917; Turku (Åbo), 72,918; Tampere (Tammerfors), 74,736; Vaasa (Vasa), 32,108. Swedish place names are given above in parentheses.

**Education and Religion.** School attendance in 1938-39 was: Elementary, 403,403; secondary, 50,580; university and schools for higher education, 8752; vocational and technical, 20,583. Less than 1 per cent of the adult population was illiterate in 1930. War damage to educational institutions in 1939-40 was estimated at 333,000,000 marks. The Technical University of Helsinki, where damage totaled 20,000,000 marks, was repaired and reopened by Oct. 1, 1940. The population on Jan. 1, 1938, included 3,680,237 Lutherans, 70,887 Greek Catholics, 9840 Baptists and other Evangelical church members, 1551 Roman Catholics, 1755 Jews, and 360 Moslems.

**Production.** About 6,368,000 acres (7.5 per cent of the total area) were under cultivation in 1939. (Agriculture engaged 60 per cent and industry 16.8 per cent of the working population at the 1930 census.) Chief products in 1939 in metric tons were: Wheat, 227,000; barley, 192,000; rye, 331,000; oats, 798,000; potatoes, 1,556,000; beet sugar, 11,700; fish, 22,400 (1938); butter, 33,200 (1938); wool, 1100 (1938); wood pulp, 2,100,000 (1938); pyrites, 352,000 (1938); pig iron and ferroalloys, 36,000 (1938); steel, 77,000 (1938); silver, 1800 (1938); and copper, 13,400 (1938). Livestock losses during the Russo-Finnish war were estimated at 169,950 cattle (9.2 per cent of the total), 153,000 sheep (14.9 per cent), 75,500 swine (15.7 per cent), and 13,000 reindeer (6 per cent). The number of chickens declined from 2,700,000 in 1939 to 1,500,000 in October, 1940.

Forests are a source of great wealth. Growing stock timber in 1939 was estimated at 57,214,000,000 cu. ft.; merchantable timber, 1,557,000,000 trees (60.7 per cent pine, 28.1 per cent spruce; remainder deciduous, mostly birch); annual increment, about 1,568,000,000 board ft.; annual felling, about 1,413,000,000 board ft.

**Foreign Trade.** General imports in 1939 totaled 7,566,300,000 Finnish marks (8,612,300,000 in 1938) and general exports were 7,696,200,000 marks (8,431,000,000 in 1938). The decrease was attributed to the Russo-Finnish war. For distribution of trade see YEAR BOOK, 1939, p. 273.

**Finance.** The budget estimates for 1941 placed revenue and expenditures at 18,000,000,000 marks, more than three times the 1940 budget and the largest in the history of the country. The 1940 ordinary and supplementary budgets provided for total receipts of 5,845,000,000 marks and expenditures of 7,052,000,000. The 1941 budget allocated 8,000,000,000 marks for compensation under the War-Damage Compensation Law and 2,000,000,000 for national defense. The Finnish mark averaged \$0.0216 in 1938, \$0.0199 in 1939, \$0.0187 in 1940.

**Transportation.** The railway mileage in 1939 was 5107 (mostly operated by the State). A new 60-mile railway from Varkaus to Veinayvi was

opened officially on Oct. 23, 1940. Net earnings of the Finnish State Railways in 1939 totaled 210,600,000 marks. For details of the railway agreement with the U.S.S.R., see *History* below. Highways and roads aggregated 39,631 miles in 1939. Construction of a motor road from Rovaniemi to Petsamo was begun in 1940, with 2000 men engaged in the work. In 1939 there were three civil air services covering 741 route miles. A thrice-weekly service between Helsinki and Petsamo was inaugurated July 16, 1940. On Jan. 1, 1940, the Finnish merchant marine consisted of 492 vessels of 635,165 tons.

**Government.** The Constitution of July 17, 1919, vested executive power in a President elected for six years by 300 electors, chosen in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The cabinet is appointed by the President but is responsible to the Diet. President, Risto Ryti (National Progressive), who succeeded Kyösti Kallio (Agrarian) as Acting President on Nov. 28, 1940, and was elected President December 19. For the standing of the parties in the Diet, see YEAR BOOK, 1939, p. 276.

## HISTORY

**Russo-Finnish War Ends.** After three and a half months of severe fighting to check the Soviet invasion launched Nov. 30, 1939 (see YEAR BOOK, 1939, p. 273 f.), the Finnish army and government was forced to sue for peace. Finnish cities were in ruins from repeated Soviet bombing raids. Despite conspicuous successes won on other fronts, the army defending the Mannerheim Line was exhausted by continuous attacks from the numerically superior invaders. Its munitions supply was low. Volunteers and supplies reaching Finland from abroad were insufficient to offset the war's drain upon Finnish manpower and munitions. For a full description of the fighting, see EUROPEAN WAR under *Russo-Finnish War*.

Consequently the Helsinki Government accepted the Soviet offer to resume peace negotiations which had been transmitted through the Swedish Government on January 29. (The British Government on January 22 had refused to transmit a similar Soviet offer.) While fighting continued with the greatest intensity, a Finnish delegation proceeded to Moscow. Negotiations were opened on March 7 and on March 12 a peace treaty was concluded under which fighting ended at noon of the following day. The treaty was ratified by the Finnish Diet on March 15 by a vote of 145 to 3.

**Peace Terms.** The peace terms imposed upon the Finns were considerably more severe than the Soviet demands made in October, 1939 (see 1939 YEAR BOOK, p. 274). The text of the principal articles of the treaty follows:

II. The national boundary between the Union of Soviet Socialist Republics and the Finnish Republic shall be established along a new line in accordance with which the entire Karelian isthmus with the city of Viborg (Viipuri) and Viborg bay with its islands; the western and northern shores of Lake Ladoga with the cities of Kexholm, Sortavala, and Suojärvi; a number of islands in the Gulf of Finland; territory to the east of Merikjärvi with the city of Kuolajärvi; and part of the Rybachii and Sredny peninsulas—in accordance with the map attached to the present Treaty—shall be included within the territory of the Union of Soviet Socialist Republics.

A more detailed delineation of the boundary line shall be established by a mixed commission of representatives of the Contracting Parties, and such a commission must

be appointed within ten days from the date of signature of the present Treaty.

III. The two Contracting Parties undertake to refrain mutually from any attack upon each other, and not to conclude any alliance or participate in coalitions directed against one of the Contracting Parties.

IV. The Finnish Republic agrees to rent to the Soviet Union for a period of 30 years, with the annual payment of eight million finmarks by the Soviet Union, Hangö peninsula and its surrounding waters within a radius of 5 miles to the south and east and of 3 miles to the west and north of the peninsula, as well as a number of islands adjacent to the peninsula (indicated upon an attached map) for the establishment of a naval base there capable of defending the entrance to the Gulf of Finland from aggression, and the Soviet Union shall be granted the right to maintain the requisite number of land and air armed forces there at its own expense for the purpose of defending the naval base.

Within 10 days from the moment that the present Treaty shall enter into effect, the Finnish Government shall withdraw all of its troops from Hangö peninsula, and Hangö peninsula with the adjacent islands shall be transferred to the administration of the Union of Soviet Socialist Republics, in accordance with the present article of the Treaty.

V. The Union of Soviet Socialist Republics undertakes to withdraw its troops from Petsamo province, which the Soviet State voluntarily ceded to Finland according to the Peace Treaty of 1920.

Finland undertakes—as was provided in the Treaty of 1920—not to maintain warships and other armed ships in the waters along the Finnish coast of the Arctic Ocean, with the exception of armed ships of less than 100 tons displacement, of which Finland shall have the right to maintain an unlimited number, as well as to maintain not more than 15 warships and other armed ships the tonnage of which may not exceed 400 tons each.

Finland undertakes—as was provided by the same Treaty—not to maintain submarines and armed aircraft in the said waters.

Likewise Finland undertakes—as was provided by the same Treaty—not to construct naval ports, bases for a naval fleet or naval repair shops on this coast on a larger scale than is required for the above-mentioned ships and their armaments.

VI. The Soviet Union and its citizens—as was provided by the Treaty of 1920—shall be granted the right of unrestricted transit through Petsamo province to Norway and return, and the Soviet Union shall be granted the right to establish a consulate in Petsamo province.

Freight, which is transported through Petsamo province from the Union of Soviet Socialist Republics to Norway, as well as freight which is transported from Norway to the Union of Soviet Socialist Republics through the same province, shall not be subject to inspection and control, with the exception of that control which is necessary for regulation of transit communication, and shall be exempt from customs duties, transit, and other fees.

The above-mentioned control of freight in transit shall be permitted only in the manner observed in such cases by the established practices of international communication.

Citizens of the Union of Soviet Socialist Republics traveling to Norway or returning from Norway to the Union of Soviet Socialist Republics through Petsamo province, shall have the right of unrestricted travel on the basis of passports issued by the appropriate Soviet organs.

Upon observation of the general regulations in effect, Soviet unarmed aircraft shall have the right to aerial communication between the Union of Soviet Socialist Republics and Norway across Petsamo province.

VII. The Finnish Government shall grant to the Soviet Union the right of transit for freight between the Union of Soviet Socialist Republics and Sweden, and for the purpose of the development of this transit along the shortest railway route the Union of Soviet Socialist Republics and Finland consider it necessary for each Party to construct, if possible during 1940, on its own territory a railway uniting the city of Kandalaksha with the city of Kemijärvi.

VIII. Upon the entry of the present treaty into force, trade relations between the Contracting Parties shall be restored and for this purpose the Contracting Parties shall enter into negotiations for conclusion of a trade agreement.

A protocol to the peace treaty provided for the withdrawal of Finnish troops from the ceded areas, by stages, between March 15–26, while withdrawal of Soviet troops from the Petsamo region was to be completed by April 10. It called for the exchange of military prisoners on the basis of a special agreement and stipulated that all "towns, villages, military and economic structures" in the evacuated areas "shall be safeguarded against damage and destruction." These provisions were carried

out as stipulated, though not without some friction between Finnish and Soviet representatives.

The treaty gave the Soviet Union all of the Mannerheim Line fortifications in the Karelian isthmus, the Finnish shores of Lake Ladoga with the admirable system of railway and road communications radiating from Viborg, a substantial slice of territory in east central Finland bisected by the Arctic Circle, and small sections of the Finnish Arctic Coast giving the Russians strategic control of the Finnish warm-water port of Petsamo. Truncated Finland was more than ever vulnerable to Soviet invasion, even though its army remained intact. It was shorn of important agricultural and industrial resources as well as of its fortifications in the southeast. Its sea approaches were dominated by Soviet naval, land, and air forces installed at Hangö. The projected railway connecting the Finnish city of Kemijärvi with the Murmansk Railway at Kandalaksha on the White Sea afforded an easy route for a future Soviet drive across Finland's "waistline" to the head of the Gulf of Bothnia. There Finland's vital rail communications with Sweden, Norway, and the outside world could be cut.

However the peace treaty left Finland free and independent for the time being. According to Foreign Minister Tanner's speech of March 13, the Kremlin made no political demands upon the Finns during the negotiations. It also agreed to "thrust aside" the Terijoki "People's Government" led by the Finnish Communist, Otto Kuusinen, which Moscow had recognized on Dec 1, 1939, as the legal government of Finland (see 1939 YEAR BOOK, p. 275).

**Foreign Aid.** Substantial supplies reached Finland from abroad before the peace treaty was concluded. The British and French Governments announced the shipment of 285 planes, 590 cannon of all types, 100 anti-tank guns, 5000 machine guns, 200,000 hand grenades, 60,000,000 rounds of rifle ammunition, and other equipment. Apparently not all of this reached the Finnish front lines in time. Sweden sent several thousand volunteers as well as funds and large quantities of arms and supplies, valued at \$120,000,000 as of April, 1940. Food, clothing, and other non-military supplies came in quantity from Norway, Denmark, the United States, and other friendly countries. The United States Government on February 29 loaned Finland \$20,000,000 for the purchase of non-military supplies additional to the \$10,000,000 advanced on Dec. 10, 1939. Private relief funds reaching Finland from abroad up to Mar. 22, 1940, were reported at nearly 200,000,000 Finnish marks (roughly \$4,000,000), of which 84,000,000 marks were forwarded by the Hoover relief committee in the United States.

Foreign Minister Tanner's speech of March 13 attributed the Finnish capitulation to the lack of sufficient troop reinforcement from abroad to relieve the battle-weary Finnish soldiers. On March 12 Premier Daladier of France announced that as early as February 5 the Allied Governments had decided to aid the Finns and had assembled 50,000 troops for embarkation the moment the Finns officially requested help. After vainly requesting the Swedish and Norwegian Governments to send troops to their aid, the Finns asked Stockholm and Oslo to permit the transit of the Allied expeditionary force across their territories. Under pressure of German threats to intervene, the Swedish

and Norwegian Governments rejected both the Finnish plea and a similar Allied request of March 5. In view of this stand, the Finns made no formal request for Allied military aid, fearing that Germany's reaction might involve Finland in the major European War. Convinced that there was no hope of effective foreign aid or of winning better terms by continuing the war, the Finnish Government decided to accept the onerous Soviet peace terms.

The Soviet Government on March 18 formally assured Sweden that it had no further territorial demands to make in Northern Europe. Immediately after peace was concluded the Finns sounded out Sweden and Norway on a Scandinavian defensive military alliance. These discussions were abandoned in Stockholm late in March when the U.S.S.R. announced that it would regard such a pact as a violation of Article III of the Russo-Finnish treaty.

**Cost of the War.** According to a Finnish communiqué issued in June, 1940, the short 16-weeks' struggle cost them 19,263 killed and 43,500 wounded. Official Soviet estimates placed Finnish losses at over 70,000 killed in action, 15,000 mortally wounded, and 250,000 other wounded. The Finnish Government was burdened with the care of nearly 10,000 widows, 20,000 to 30,000 orphans, and 600,000 homeless persons, of whom about 470,000 were evacuees from the territory ceded to the U.S.S.R.

The ceded territory represented one-tenth of Finland's land area and one-twelfth of its tangible national wealth in the form of farms, factories and forests. It accounted for 11 per cent of the republic's forest resources, 16 per cent of the railway lines, and 10 per cent of the industrial output. Factories in the ceded Karelian isthmus and Lake Ladoga areas had accounted for 86 per cent of all Finnish exports. Viborg and Hangö had handled about one-third of the foreign trade. In addition to the territorial losses, 32 of Finland's 38 towns were wholly or partially destroyed by Russian air raids. Some 9000 buildings housing around 40,000 persons were demolished. Altogether the cost of the war was estimated about 30,000,000,000 Finnish marks (approximately \$600,000,000), or about one-fourth of Finland's total national wealth.

**Reconstruction Measures.** Finland had scarcely begun to face the huge task of reconstruction when the spread of the European War to Norway in April cut off a large part of the imports and relief funds reaching Finland from abroad. This multiplied the government's difficulties. Foreign trade during the first half of 1940 was about one-fourth that of the first six months of 1939. The production index for export industries (Base: 1935 = 100) was 42 for the second quarter of 1940 as compared with 102 for the same period of 1939. At the beginning of September there were 5100 unemployed registered in addition to 183,467 evacuees on relief.

The government adopted drastic measures to deal with this economic emergency. During the session of the Diet that ended August 3, an emergency settlement law was passed for placing the 470,000 evacuees from ceded territory on new land. A capital levy estimated to yield 4,000,000,000 marks over a four-year period was imposed upon all property subject to income and property taxes and upon scientific and philosophic institutions, private railways and savings banks. The rate of the levy ranged from 2½ per cent on property valued at 40,000 marks to 20 per cent on that

valued at 41,000,000 marks or more. Surtaxes ranged from 4½ to 20 per cent. This income was set aside to compensate individuals and corporations for war losses on a sliding scale from 100 per cent for property valued at less than 10,000 marks down to 5 per cent on property valued at 41,000,000 marks or more.

Refugees from the ceded territories were resettled on farms carved out of the larger private estates and government and church land holdings. Agricultural societies and banks subscribed 50,000,000 marks for a corporation (the Land Clearing Co.) to undertake large-scale land-clearing operations with modern machinery. At the same time a comprehensive program for the intensification of agricultural, mineral, and industrial production was inaugurated. A government committee drafted legislation for the replacement of essential industries lost to the Soviet Union.

To combat the rising cost of living, the Diet on June 7 fixed rents for houses, apartments, and other buildings at the level existing June 1, 1939. Another law established maximum prices for domestic cereals and authorized purchase of all domestic wheat, rye, and barley by the government grain store. Other powers conferred by the Diet enabled the government to regulate the distribution, consumption, and price of firewood. Rationing and price fixing for essential food supplies became more rigorous during the winter. A licensing board was established to regulate and encourage foreign trade. By agreement between workers and employers, wages were adjusted to the rising cost of living. Trade agreements were negotiated with Denmark, Germany, Hungary, Sweden, and the Soviet Union. Together with relief supplies brought in from the United States through Petsamo, the foodstuffs and other materials obtained through barter agreements enabled the Finns to emerge from the winter of 1940-41 without actual famine, although hardships were severe.

**Political Changes.** Premier Risto Ryti's government, representing a coalition of the five largest political parties (Social Democrats, Agrarians, National Coalition, Swedish People's party, and National Progressives), was reorganized on March 27, 1940, to carry out the reconstruction program. Dr. Ryti, a National Progressive, remained at the head of the cabinet, but replaced seven of the 14 Ministers.

The government's task was lightened by the unity of the moderate Left, Right, and Center political groups that had been cemented in the crucible of war. A formal declaration issued February 20 had healed the long antagonism between the Rightist Civic Guard and the powerful Social Democratic party. The Civic Guard announced that henceforth it would admit Social Democrats to its ranks, while the Social Democrats agreed to participate in this elite corps that played a leading part in winning Finnish independence from Soviet Russia in 1917-18. A radical faction of Social Democrats, critical of the party's moderate policies, was expelled on September 27 and formed a new party, called the Socialist Dissenters.

After the peace treaty was signed, some Finnish citizens and newspapers urged Field Marshal Baron Carl Gustav Mannerheim, commander of the Finnish armies, to assume "direction of the national fate." Majority sentiment strongly opposed a dictatorship and the democratic governmental system remained unimpaired. However a bill postponing parliamentary elections until 1942 went in-

to effect October 25. This move was attributed to the tense international situation (see below) and to the difficulty of fixing new electoral districts as a result of boundary changes.

President Kallio resigned on November 28 because of ill health and Premier Ryti succeeded him as Acting President until formally elected to the Presidency by the electoral college on December 19. The vote was 288 to 2. On the same day the retiring President collapsed and died at the conclusion of a great farewell demonstration by the people of Helsinki (see *NECROLOGY*). Sworn in before Parliament on December 21, President Ryti described the country's policy as one of remaining outside all wars, maintaining its existence and independence at all costs, developing "the best relations with our neighbors, especially the Soviet Union," and the strengthening of Finland's connections with Germany.

On the night of December 19, President Ryti appointed Minister of Defense Gen. Karl Rudolf Walden as Acting Premier. After vain efforts to form a party government, the national union government was continued under a new Premier, Johan Wilhelm Rangell, appointed Jan. 4, 1941. A non-party man and former head of the Bank of Finland, Rangell made only two changes in the former Cabinet line-up.

**Post-war Relations with U.S.S.R.** Diplomatic relations between Finland and the Soviet Union were resumed on April 7, with the appointment of Ministers to Moscow and Helsinki respectively. On April 12 the Petsamo district was returned to Finland in accordance with the peace treaty. A Finnish-Soviet trade and clearing agreement was concluded June 28. On September 6 another accord was signed in Moscow providing for direct passenger and freight traffic between the U.S.S.R. and Finland, transit traffic between the Soviet Union and Sweden across Finland, and between the U.S.S.R. and the leased base at Hangö. Construction of the Kemijärvi-Kandalaksha railway proceeded. At the demand of the Soviet Union, the Finns early in July were reported to have blown up the fortifications and gun emplacements they erected on the Aland Islands at the beginning of the Russo-Finnish war.

New Soviet demands were made upon Finland at frequent intervals, arousing Finnish fears that Moscow planned to establish complete domination by a step-by-step policy without resort to war. In late July the Soviet Government was reported to have insisted upon Finnish demobilization. At the same time the Moscow press became increasingly critical of the Finnish Government's internal policies. It attacked the legalization of the Fascist movement in Finland under Gen. Kurt Wallenius and bitterly assailed the police measures taken to curb pro-Russian demonstrations in Helsinki and other cities early in August. The Soviet Premier, Molotov, on August 1 assumed a protectorate over the outlawed Communist movement in Finland by asserting that "Russo-Finnish relations may suffer unless coercion of those classes that are striving to strengthen good relations between Finland and the Soviet Union is stopped."

The Finnish Government on August 9 issued a lengthy statement in response to persistent Russian demands for the release of ringleaders of the pro-Soviet demonstrations. It asserted that Finland had striven to establish good relations with the Soviet Union but that since a few trouble-makers were disturbing public order, further demonstrations

had been forbidden. Neutral sources in Helsinki reported that the demonstrators were almost without exception paid Russian agents, numbering about 200 in the capital and smaller groups in other cities. Nevertheless formidable Soviet pressure upon the Finns continued. It was held responsible for the resignation of Minister of Social Welfare Tanner from the cabinet in August, for the Soviet-Finnish railway accord in September, and for the Soviet-Finnish agreement of October 11 for permanent demilitarization of the Aland Islands. Finland agreed to maintain the demilitarization and not to place the islands at the disposal of any other power. Despite these concessions, the Soviet press campaign against "bourgeois democracy" in Finland continued throughout the year.

**Finnish-German Relations.** Russia's threatening attitude forced the Finns to seek closer relations with Germany in the hope of winning Hitler's military support if the Red Army again invaded Finland. A mission that visited Berlin for this purpose during the summer reportedly was advised to seek a reconciliation with Moscow. However an important Finnish-German trade accord was signed in Berlin June 29, under which Finland supplied the Reich with large quantities of cellulose, used in munitions-making.

On September 24 the Finnish Government announced that, following German demands upon Finland, it had agreed to permit the transport of German troops and supplies across northern Finland to Norway. German troops landed at Vasa the same night and a small number, estimated at less than 5000, remained quartered at transit points leading to northern Norway. After Foreign Commissar Molotov's visit to Berlin, it was reported in mid-November that the German troops were being withdrawn from Finland.

Speaking in Helsinki on November 19, Premier Ryti said that Finland would co-operate with German plans for the economic reconstruction of Europe, provided no violation or impairment of its political independence was involved. These developments were believed to indicate that Finland was prepared to throw in its lot with Germany if it had to choose between German and Soviet domination.

**Other Foreign Relations.** The British Government registered a vigorous protest against the Finnish decision to permit the transit of German troops. It threatened to bar passage of supplies to Finland through the blockade if the Helsinki Government committed "any further unneutral act."

Despite their own pressing needs and problems, the Finns sent Norway more than \$500,000 in cash and supplies in less than a month after the German invasion of Norway in April. This was to repay Norway for aid received by Finland during the Soviet-Finnish War. Swedish-Finnish diplomatic and economic collaboration remained close, and in June an agreement was concluded for joint use of the port of Petsamo.

The Finnish Government again paid its semi-annual installment due June 15, 1940, on its debt to the U.S. Government, but the December 15 installment was postponed in accordance with the joint resolution of the U.S. Senate and House of Representatives, approved by President Roosevelt June 15 (see *REPARATIONS AND WAR DEBTS*). The \$30,000,000 in relief loans advanced to Finland in 1939-40 by the Export-Import Bank of Washington was virtually exhausted by the end of 1940.

See COMMUNISM; LABOR CONDITIONS; LEAGUE OF NATIONS; REPARATIONS AND WAR DEBTS; and FRANCE, GERMANY, GREAT BRITAIN, NORWAY, SWEDEN and UNION OF SOVIET SOCIALIST REPUBLICS, under *History*. Also see MUSIC; WAR RELIEF.

**FINNISH CAMPAIGN.** See EUROPEAN WAR.  
**FIRE PROTECTION.** Estimates of the National Board of Fire Underwriters place the national fire loss during 1940 at \$306,469,520. This is a decrease of approximately \$7,000,000 from the corresponding estimate of the fire loss for 1939. This reduction is a reversal of the trend which has manifested itself during the past four or five years.

COMPARATIVE MONTHLY LOSS ESTIMATES

Month	1938	1939	1940
January . . .	\$27,676,337	\$27,615,116	\$36,260,650
February . . .	26,472,626	29,303,520	34,410,250
March . . .	29,050,968	30,682,168	29,788,800
April . . .	25,616,112	27,061,522	26,657,190
May . . .	22,917,577	27,031,700	23,446,590

Total	\$302,050,000	\$313,498,840	\$306,469,520

The year got off to a bad start when the Marlborough apartment hotel in Minneapolis was destroyed by fire on the morning of January 3, causing 19 deaths. Poor construction and inadequate exit facilities were largely responsible. The largest loss of life by fire occurred on April 23 at Natchez, Miss., when 207 Negroes were burned to death and 200 others injured in a fire which swept through a dance hall. Nearly every well-known principle of ordinary fire protection was violated in this instance.

According to the National Fire Protection Association, 38 fires occurred in the United States and Canada during 1940, each of which resulted in a loss estimated at not less than \$250,000. Of these, four occurred in Canada. This represents an increase of 11 fires over the number reported for 1939 and is 3 greater than the average for the past five years. A total of 71 lives were lost in these fires, 60 more than were lost in the corresponding fires of 1939 but only 10 more than in 1938.

The largest loss of the year was the conflagration of July 30 at Camden, N.J., which involved a plant engaged in manufacturing waxes, polishes, greases, and other flammable compounds. The fire destroyed a block of factory buildings and numerous nearby dwellings with a loss estimated close to \$2,000,000. Ten other fires caused losses exceeding \$500,000.

An analysis by the National Fire Protection Association classifying the national fire record by occupancies and causes attracted considerable attention. It showed that during 1939, the last year for which figures were available, there were an estimated 685,000 fires in the United States, of which 340,000 occurred in dwellings and 53,000 in hotels and apartment houses. The principal causes were shown to be smoking, sparks on roofs, defective or overheated chimneys and flues, and electrical fires.

Without question, the most important development in the fire field during 1940 was the utilization of fire as a deadly weapon by the warring countries by means of the incendiary bomb. To

meet this new situation, England alone increased its fire-fighting forces tenfold. Daily, the fire brigades, auxiliary fire forces, and the air-raid-precaution units in England have been making history.

This development has aroused widespread interest among the fire fighters of the United States and Canada. By the end of 1940 for the most part, specific plans for fire defense of American cities had not been crystallized. The indications were clear, however, that during 1941 a considerable movement to organize auxiliary fire forces and to develop civilian defense plans for fire emergencies would be undertaken. New York made an elaborate survey of its situation and of its facilities from the point of view of possible fire attack by air. In Boston, an auxiliary fire service was initiated and hundreds of civilian volunteers were trained in the elements of fire fighting. In the various Canadian cities, comprehensive plans for air-raid defense, including elaborate fire-protection procedures, were developed and were just getting under way at the close of the year.

The Federal Bureau of Investigation assumed responsibility for the protection of industries producing defense supplies from sabotage and fire. Many fire organizations throughout the country took special steps to investigate conditions in essential industries and to prepare for anticipated sabotage.

Already many steps are being taken by a wide variety of organizations and individuals to cope with the problems of fire defense. The War Department, Navy Department, FBI, National Defense Advisory Commission, State and local defense committees, State fire marshals, municipal fire chiefs, fire-insurance boards and bureaus, and safety and fire-protection engineers of industry are all concerned with various phases of this problem. It is probable that in 1941 more adequate co-ordination of these efforts will be developed so that mistakes, confusion, and overlapping may be avoided. The whole program of fire defense, as it develops, may have a lasting effect toward reduction of loss of life and property by fire under war-time or peace-time conditions.

The great strides in firemen's training which have been made in recent years continued during 1940. Seven States, Alabama, Florida, Indiana, Iowa, Nebraska, New Hampshire, and Vermont, offered firemen definite measured courses of instruction for the first time. This brings to 23 the number of States where comprehensive training is available. Nearly 13,000 firemen completed one or more units in such courses during the year. Annual short courses were held in 25 States and regional courses in 11 States. Field instructors gave training in 12 States. It is estimated that 80,000 firemen received some benefits from these training programs during the year. There are now only seven States which do not have some sort of State-wide training program, and three of them have programs to be initiated during the coming year.

An interesting development is the plan adopted in Cleveland, Ohio, for a board of strategy for the fire department under the supervision of the Director of Public Safety. The board is made up of the fire-department division and battalion chiefs and meets regularly. The board sponsors a contest between the various battalions of the fire department creating great interest in fire-prevention work. Cleveland won the award for excellence in Fire Prevention Week activity, competing with over 1000 other communities in the contest con-

ducted by the National Fire Protection Association. Cincinnati, Ohio, took first place in the Inter-Chamber Fire Waste Contest conducted by the National Fire Waste Council for excellence in all-around fire-prevention activity during the previous year.

The most significant technical developments in the field of fire protection during 1940 were the publication of a new edition of the National Electrical Code, perhaps the most widely adopted technical standard in the country, and the issuance of completely new standards for the installation of automatic sprinkler systems. Both of these were developed by technical committees of the National Fire Protection Association.

Few legislative items are gaining such widespread popularity as adequate State-wide control of fireworks. The State of New York adopted a fireworks law in 1940 prohibiting the promiscuous distribution of fireworks to the public, thus making a total of nine States which now restrict the use of fireworks to supervised public display. Bills of this character are scheduled for introduction in the legislatures of many States during the coming year.

See CIVILIAN CONSERVATION CORPS; FORESTRY; GENERAL LAND OFFICE, INSURANCE.

CHARLES S. MORGAN.

**FISCAL SERVICE.** The Fiscal Service of the Treasury Department was created by the President's Reorganization Plan No. III, dated Apr. 2, 1940, under the provisions of the Reorganization Act of 1939. This plan was made effective June 30, 1940, by joint resolution approved June 4, 1940. The Fiscal Service consists of the following bureaus and offices.

**Office of the Fiscal Assistant Secretary.** The Fiscal Assistant Secretary is a permanent career officer and shall be appointed by the Secretary of the Treasury in accordance with the Civil Service laws. The Fiscal Assistant Secretary, under the direction of the Secretary, performs all functions pertaining to (1) the administration of financing operations, (2) the supervision of the administration of the functions and activities of the units grouped under the Fiscal Service; (3) supervision of the administration of accounting functions and activities in the Treasury Department and all its bureaus and offices, through the Commissioner of Accounts.

**The Bureau of Accounts.** The Bureau of Accounts consists of the Office of the Commissioner of Accounts, the Division of Bookkeeping and Warrants, the Division of Disbursement, the Division of Deposits, the Section of Surety Bonds, the Section of Investments, and the Emergency Relief Accounting Organization.

Government Reorganization Plan No. III transferred to the Fiscal Assistant Secretary, to be exercised under the direction of the Secretary of the Treasury and through the Commissioner of Accounts, all functions vested in the Under Secretary and any Assistant Secretary of the Treasury pertaining to supervision of the administration of the accounting functions and activities in the Treasury Department and in all its bureaus, divisions, and offices, and all functions vested in any other officer or employee of the Treasury Department (except the Coast Guard) of authorizing the installation, maintenance, revision, and elimination of accounting records, reports, and procedure.

**The Bureau of the Public Debt.** The Bureau of the Public Debt, under the Commissioner of the

Public Debt, is charged with the conduct of transactions in public debt and paper currency issues of the United States. It also is charged with the procurement of distinctive paper required for printing currency and public debt securities of the United States. The Bureau also conducts transactions in the interest-bearing issues of the Philippine and Puerto Rican Governments, for which the Treasury Department acts as agent, and of the Home Owners' Loan Corporation, the Federal Farm Mortgage Corporation, the Federal Housing Administration, the Reconstruction Finance Corporation, the Commodity Credit Corporation, the United States Housing Authority; and in the consolidated issues of the Federal farm-loan banks. The Bureau organization consists of the Office of the Commissioner, the Division of Loans and Currency, the Office of the Register of the Treasury, the Division of Public Debt Accounts and Audit, the Division of Savings Bonds, and the Division of Paper Custody.

**Office of the Treasurer of the United States.** The Treasurer of the United States is charged with the receipt and disbursement of public moneys that may be deposited in the Treasury at Washington and in the other depositories authorized by the Secretary of the Treasury to receive deposits of Government funds for credit in the account of the Treasurer of the United States. There are in the Office of the Treasurer six divisions: Accounting Division, Cash Division, Currency Redemption Division, Division of Chief Clerk, Division of General Accounts, and Division of Securities.

D. W. BELL.

**FISH AND FISHERIES.** See ALASKA; FISH AND WILDLIFE SERVICE; ZOOLOGY.

**FISH AND WILDLIFE SERVICE.** The Federal Government's work in 1940 in connection with the country's resource of wild creatures was distinguished largely by improvements in organization and by attention to the relationship of wildlife conservation to the needs of national defense. Most of the year's activities were a continuation of programs already under way.

A year of organizational changes began on July 1, 1939, with the transfer of the Bureau of Biological Survey and the Bureau of Fisheries to the Department of the Interior, from the Departments of Agriculture and Commerce, respectively. Later the wildlife division of the National Park Service was transferred to the Bureau of Biological Survey, and the field work of that Bureau was reorganized into five regions, with headquarters at Portland, Ore.; Albuquerque, N.M.; Minneapolis, Minn.; Atlanta, Ga.; and Boston, Mass. On June 30, 1940, the Biological Survey and the Bureau of Fisheries were consolidated to form the Fish and Wildlife Service. Under the direction of Dr. Ira N. Gabrielson, former Chief of the Biological Survey, the new Service carries on its work through 13 divisions, as follows: Administration, Wildlife Research, Fishery Biology, Fishery Industries, Federal Aid in Wildlife Restoration, Land Acquisition, Wildlife Refuges, Construction and Civilian Conservation Corps Operations, Fish Culture, Game Management, Alaska Fisheries, Predator and Rodent Control, and Public Relations. W. C. Henderson, formerly Associate Chief of the Biological Survey, and Charles E. Jackson, last Deputy and Acting Commissioner of Fisheries, are Assistant Directors.

Wildlife conservation which helps to make a "country worth living in" plays an important part in national defense preparations by helping to build up individual and national morale. More tangible emergency contributions have also been pointed out. The value of the food resources in fishes, for example, has been emphasized in many ways, including the recent establishment of radio outlets in Boston, Chicago, Jacksonville, and New Orleans for the daily broadcast of market news reports to encourage the economic and profitable use of fishes as food. Fisheries personnel and material have been of assistance to the Navy, and the fishing fleet is regarded as a valuable reserve. The Service is prepared to meet emergency needs for controlling the numbers of birds and mammals that destroy crops and livestock and to co-operate in other ways in the defense program. The importance of maintaining conservation policies during the stress of emergencies, as well as at other times, and avoiding unwise exploitation has been emphasized.

Six new laboratories for fishery research were established, bringing the total to eleven, including a new floating laboratory for studies on the fisheries grounds. Research on birds and mammals continued in the field and in laboratories, including two new ones at the Patuxent Research Refuge, in Maryland.

Statistics compiled indicated that in 1938, the latest year for which complete data are available, the landings of United States fishing craft totaled more than 4,250,000,000 lb. The wholesale value of fishery products exceeded \$251,000,000. About 250,000 persons were employed in capturing, processing, and wholesaling the catch. Estimates compiled indicated that the big game population of the United States in 1939 was more than 5,800,000. The annual waterfowl inventory in January, 1940, resulted in an estimate of more than 65 million ducks and geese, representing the fifth consecutive annual increase as a result of the restoration program. Compilations of State reports indicated that in the 1938-39 seasons more than 7,858,275 persons paid a total of \$10,837,168 for fishing licenses and more than 7½ million paid a total of \$12,600,000 for hunting licenses. Sales of the Federal stamp required of all over 16 who hunt migratory waterfowl continued to increase, a total of 1,111,561 stamps having been sold in the 1939-40 year.

The Federal wildlife refuge system increased to a total of 263 refuges, with an acreage of 13,595,812. Output of fish and eggs at the 110 Federal hatcheries during the year ended June 30, 1940, approximated 7,400,000,000, a drop from the previous year's 8,042,000,000 attributed mainly to curtailment of cod, haddock, and flounder production; 24 out of the 45 species handled were distributed in increased numbers.

Regulations governing migratory-bird hunting in 1940 provided a 60-day hunting season in each of 3 zones, an increase over the previous 45-day season, but shortened seasons on woodcocks and reduced bag limits on geese, mourning doves, and white-winged doves.

The program for aiding the States in wildlife restoration became more extensive and more effective. In all, 237 projects were begun by the States with Federal aid during the year ended June 30, involving \$2,082,735, a great increase over the preceding year, first under the program, when 58 projects were begun at a cost of \$343,932. An increased Federal appropriation of \$2,300,000 became available on July 1 for this program, which

provides for Federal payment of 75 per cent of the cost of projects carried on by the States with Federal approval.

**FISHERIES, Bureau of.** Formerly bureau of the U.S. Department of the Interior, consolidated with the Bureau of Biological Survey on June 30, 1940, to form the Fish and Wildlife Service (q.v.).

**FLANDERS, Battle of.** See EUROPEAN WAR under *The Battle of Flanders*.

**FLAX.** Flaxseed production in the United States in 1940 was estimated by the U.S. Department of Agriculture to total 31,127,000 bu. from 3,228,000 acres as compared with 20,152,000 bu. from 2,250,000 acres in 1939 and almost three times as large as the 1929-38 average production of 10,846,000 bu. Increased production in 1940 was attributed to a greatly expanded acreage in response to AAA regulations favoring flax production and favorable prices for the 1938 and 1939 crops, and above average acre yields, 9.6 bu. versus 9.0 in 1939. Leading flax States were: Minnesota with 16,695,000 bu., North Dakota 3,888,000, California 2,814,000, Iowa 2,520,000, and South Dakota 1,904,000 bu. Flaxseed made a large yield on an increased acreage in the main producing states and production was increased in the new winter flax areas in the Southwest. The season average price per bu. (preliminary) received by farmers was \$1.341 and the value of production was estimated at \$41,746,000 in 1940 compared to \$1.463 and \$29,492,000 in 1939.

The 1940-41 crop of flaxseed in other countries reporting was for Canada 3,189,000 bu., Lithuania 1,294,000, India 18,680,000, and Hungary 266,000 bu.; and the 1939-40 crop of Argentina was 39,935,000 bu. and of Uruguay 4,693,000 bu. Flax fiber production reported in 1940 was in Hungary 7,180,000 lb., Rumania 12,163,000, Estonia 17,527,000, Lithuania 63,709,000, and Egypt 8,419,000 lb. The 1939 crop of Belgium was estimated at 130,053,000 lb. and of U.S.S.R. 1,388,917,000 lb.

**FLOOD CONTROL.** Works for flood control and the regulation and utilization of flood waters, together with the protection of land and property from damage and destruction by flood overflows, are in progress in nearly every part of the United States, even in semi-arid areas. Such works become of increasing necessity and importance with the development of the country and the phenomenon of increase in flood heights and flood volumes. Many projects of this kind, however, will be affected adversely by the momentous decision of the Supreme Court, in December, giving to the Federal government authority over practically all streams, instead of only over navigable streams. The tendency will be to leave such work to be planned by and paid for by the Federal government, with consequent delays. (See also ELECTRIC LIGHT AND POWER, under *Government*; SUPREME COURT.)

Dams form reservoirs to detain or store flood

waters that would otherwise pursue a devastating course. Levees confine flood flows within restricted channels and protect vast areas of adjacent low lands. Short cuts across long serpentine bends in the streams hasten the passage of flood waters. Few dams are for flood control exclusively, the stored water being utilized for power or irrigation, or discharged under regulation in order to maintain a uniform minimum flow in the stream. However, such dual use presents a problem in that such a reservoir should have ample capacity to receive and hold a sudden heavy flood flow, while for power purposes it needs to have a constant and uniform supply and discharge. A bill appropriating \$191,000,000 for flood control works passed the House of Representatives in May.

One of the greatest problems in flood control is the control of the Mississippi River, which involves reservoirs at the headwaters and along the courses of the main river and its tributaries as well as levees to confine the flood to definite channels through low-lying lands. An item in this work, to be begun in 1941, is the \$25,000,000 Norfolk dam in Arkansas, on a tributary of the White River.

The great Shasta dam, now being built on the Sacramento River, has its main purpose in flood protection for the lower part of the valley. The greatest flood on record for this river occurred in February, 1940, causing property loss estimated at \$10,000,000, which included the wrecking of the contractor's construction plant on the unfinished dam. A series of four dams on the Colorado River will provide much-needed protection for a stretch of 300 miles above its mouth. The reservoirs thus formed will serve for irrigation, power development and regulation of the flow in the river channel. Three of the dams (Buchanan, Inks, and Austin) are completed, and the Marshall Ford dam is under construction. Flood control along the Tennessee River and its tributaries is one of the many purposes of the Tennessee Valley Authority.

On the Ohio River, a series of locks and dams regulates the flow and maintains a uniform level, but many cities along the river need to provide protection for low-lying areas. At Cincinnati, a court decision has removed opposition to the issue of bonds for such protection for the Mill Creek industrial district. At Louisville, Ky., a bond issue has been authorized for a flood wall along the river front, but nothing can be done until the Federal government makes money available for its share of the work. In view of the present activities for "defense" projects, Federal funds normally available for such projects have been withdrawn, so that many such projects are halted indefinitely.

The city of Huntington, W. Va., has a flood protection wall and levees along the Ohio, and when the Ohio rose  $6\frac{1}{2}$  ft. above previous flood levels in April, 1940, the normal openings for traffic were closed by gates. Extensive flood works in the city and along the rivers has been needed at Pittsburgh, Pa., and as part of these works the State Water Power and Resources Board has approved the construction of a \$23,000,000 dam on the Conemaugh River, near Salzburg, about 30 miles above Pittsburgh. An unusual stipulation is that the stored water must not be used for power purposes. Thus the dam will be of the retention type, normally empty, and having openings allowing a restricted flow of the flood water. Of ten dams proposed to reduce flood flows in the Ohio and thus protect Pittsburgh, and to be built by the Federal govern-

ment, the sixth is to be started in 1941 on the Youghiogheny River, at Confluence, Pa.

A \$30,000,000 flood-control project for Harris County, Texas, and the city of Houston, approved in 1940, includes a dam and retention reservoir on Buffalo Bayou, 15 miles west of the city, and canals around both sides of the city to take care of possible excessive flood flows. At the opposite side of the country is Hartford, Conn., whose protection against such a flood as that of 1936 in the Connecticut River is being completed by the U.S. Engineers in the form of long levees.

One curious phase of flood-protection projects is that of towns removed from their original sites in order to escape from recurring floods. This is practicable only for small communities. Probably the largest is Shawneetown, Ill., on the Ohio River, which had a population of 2000, while the new town, on high ground three miles distant, is laid out for about 2500. River-front levees, periodically raised or rebuilt, were periodically overtopped or breached as successive floods rose to higher levels. Besides new dwellings and other facilities, a new water supply system and sewerage system, with treatment plants, had to be provided. Three small towns which have removed from sites subject to periodical flooding are Leavenworth, Ind. (450 population); Hill, N.H. (400); and Greenville, Mo.

See COAST GUARD, U.S.; CONNECTICUT under *History*; ENGINEERS, CORPS OF; FLOODS; SOIL CONSERVATION SERVICE; WATERWAYS, INLAND.

E. E. RUSSELL TRATMAN.

**FLOODS.** In general the floods which occur when natural streams of inland regions overflow their banks may be grouped into two classes. One is the local type over the land bordering a small stream; if the small stream flows through land which is not densely populated little damage is done but if the land is thickly settled great damage may be caused by a local flood. The other is the flood over land bordering a large stream. Both classes of floods are caused by heavy rains (occasionally supplemented by melting snow). While there is no sharp line of demarcation between the two types of floods, it may be said that: (1) the average intensity of the rainfall over the drainage area which causes a local flood must be considerably greater than that causing a flood in a large stream before much outside public interest is attracted to the local flood; (2) local floods are of short duration while floods in large streams may last weeks or months; (3) in the present state of meteorological and hydrological sciences it is impossible to predict the occurrence of local floods, while floods in large streams can usually be accurately predicted and most governments maintain services for this purpose. A seacoast sometimes experiences a flood of a third class; such floods are not due to rains but result from the so-called tidal waves caused by earthquakes or terrific windstorms.

There were several noteworthy floods in the United States during the year as well as about the usual number of minor floods.

There was a flood in the Sacramento river valley late in February which exceeded the flood in that valley of December, 1937, and in many respects surpassed any flood there since systematic records of floods have been kept. From Kennett, Calif., to the mouth of the Feather River new high water marks were established. The magnitude of this flood was by far the greatest of record in the upper

part of the basin. However, farther down the river, where the flood-control system with its by-passes and levee construction work has been constantly changing the natural conditions and present river gage heights are not comparable with those of earlier years and consequently are not a true index of the volume of water that is being discharged by the river. Before there was any flood control system in operation in the Sacramento Valley the overflow waters drained into natural reaches of unreclaimed lowlands on each side of the river. Under present conditions where the water is confined to leveed channels, not only are gage heights proportionately higher for the same volume of water but failures in levees are more disastrous because the reclaimed lands are affected. The extraordinary vigilance that was maintained by supervising engineers and reclamation officials throughout the valley both in safeguarding levees that were severely strained and in repairing hundreds of minor breaks was instrumental in preventing wholesale disaster in many areas. For example, the Sutter Basin with a 60-mile levee system was saved only by desperate efforts. Nevertheless the overflow due to the high water was extensive. The total acreage of agricultural lands flooded was slightly more than half a million. The total flood damage was nearly \$7,000,000.

There were extensive floods in the Ohio River and Valley in May but the flood waters did not reach especially high levels and hence these floods were not noteworthy.

On June 4 and 5 excessively heavy rains in northeast Nebraska caused disastrous local floods in small streams in that section of the State. The greatest damage was in the towns of Homer, Pender, and Winnebago; the area in which the heavy rain occurred is hilly so that the run-off was rapid, and it was sufficiently large to cause flood conditions in some of the larger streams such as Logan Creek and Elkhorn River. Five persons were drowned and the property damage was nearly \$2,000,000.

There was a damaging flood in the Tombigbee River system in July. Rains were heavy over the Black Warrior and Tombigbee basins on July 2 and 3 causing sharp rises on the latter of these days. Heavy showers occurred over the upper parts of both drainage areas every day except one from the third to the fifteenth; the Black Warrior at Tuscaloosa, Ala., had three flood crests and the upper Tombigbee had two flood crests during this period. In the lower portion of the Tombigbee River the flood continued until August 1. This flood caused over \$4,000,000 worth of damage most of which was to prospective crops.

In August there were severe floods in the rivers of North Carolina and in portions of Virginia, South Carolina, Georgia, and Tennessee. These floods resulted from excessive precipitation accompanying the passage of a tropical Hurricane (q.v.) near Savannah, Ga., on August 11. This Hurricane moved slowly westward to the Southern Appalachian Mountain region; it gradually turned clockwise and on the thirteenth it was moving northward and on the next day eastward, finally it passed out to sea again on August 17. All the rivers on the Atlantic Slope from the James River in Virginia to the Altamaha River in Georgia had floods as well as the New, French Broad, and Holston Rivers of the Ohio Valley. Previous high stages of record were exceeded at a number of places; at Weldon, N.C., on the Roanoke River a

stage of 58 feet was reached on August 18, exceeding the crest stage at that place during the great flood of 1877 by nearly 5 feet. See DISASTER LOAN CORPORATION; FLOOD CONTROL.

RICHMOND T. ZOCH.

**FLORIDA.** Area, 58,666 square miles, including (1930) 3805 square miles of water. Population, Apr. 1, 1940 (census), 1,897,414 (1,045,791 urban and 851,623 rural); 1930, 1,468,211. The figure for 1940 came within 40,000 of doubling that of 1920 (968,470). Chief cities (1940): Jacksonville, 173,065; Miami, 172,172; Tampa, 108,391; Tallahassee (State capital), 16,240.

**Agriculture.** Florida harvested, in 1940, 1,620,000 acres of the principal field crops; another great part of the agricultural return came from the orchards. The year's indicated crop of oranges, 29,800,000 boxes, was expected to bring the growers \$24,034,000; that of grapefruit, 21,000,000 boxes, \$11,994,000. Of the field crops, corn, on 821,000 acres, made 9,031,000 bu. (approximate value, \$5,870,000); potatoes, on 28,000 acres, 4,312,000 bu. (\$4,010,000); tobacco—mainly for cigars, 16,700 acres, 16,123,000 lb. (\$4,536,000); sugar cane, 30,400 acres, 1,216,000 tons (\$3,283,000), much exceeded the average of previous years; sweet potatoes, 18,000 acres, yielded 1,080,000 bu. (\$1,026,000). The great production of truck crops brought, for 1940, an estimated \$31,165,000.

**Mineral Production.** Phosphate rock furnished about two-thirds of Florida's total value of mineral production for 1938, which attained \$12,866,981 (Bureau of Mines' estimate published in 1940). Producers' sales of phosphate rock fell to 2,678,784 long tons for 1939, from 2,707,335 for 1938; in value, more sharply, to \$7,893,457, from \$8,773,680. The Federal Department of the Interior suspended, in 1939, sales of public lands in the State prior to the outcome of an investigation, then started, to find whether land in addition to the actual 66,000 acres should be put into the Federal Phosphate Reserve. An estimate of the geologist George R. Mansfield, published in 1940, put total reserves of phosphate rock in Florida above 5 billion tons: of this, over 2 billions known, 1¼ probable, and 1¼ possible.

**Education.** Florida's inhabitants of school age (from 6 years to 20) were reckoned at 468,755. For the academic year 1939-40, enrollments of pupils in public schools numbered 397,900. This comprised 912 in kindergarten, 249,354 in elementary studies through sixth grade, and 147,634 in the six higher grades. The year's current expenditure for public-school education amounted to \$18,910,624. The 13,629 teachers' and principals' salaries, taken together, averaged \$1009.14 for the year.

**History.** A severe and persistent cold spell, which afflicted the southern States from Louisiana to Virginia in the latter part of January, did much of its worst damage to crops in Florida. Freezing temperatures recurred every night in the greater part of the State, from January 19 to January 28; the lows ranged from 42 at Key West to 10 at Deland, and 24 was reported near Miami. The chief damage befell vegetables growing in Broward and Dade counties, where losses apparently ran to some \$15,000,000. Damage to oranges and grapefruit, while reported extensive, was limited by smudging.

The U.S. Supreme Court set aside (February 12) the conviction of four Negroes found guilty in a Florida court and sentenced to death for the murder of a white merchant in 1933; the decision

held that confession had been extorted from the accused after a week of questioning attended with brutality, and that they had thus been deprived of the Constitutional guarantee of due process of law and of guarantees in the Fourteenth Amendment.

Some of the cities of the State reportedly showed symptoms of the tendency toward corrupt or weak government familiar among communities of rapid growth. The Federal Bureau of Investigation worked with the State's Attorney General to break up gambling enterprises against which reformers, notably in Miami and Orlando, had exerted themselves in vain; gambling-houses, chiefly running lottery-like games known as cuba and bolito, were closed by use of injunction.

The disturbance of foreign trade by war abroad, rendering the nation's importation of rubber uncertain, renewed interest in experiments toward growing rubber in Florida. One of these, a rubber plantation at Miami, maintained by the Federal Government, had spent, according to the *Dallas News*, over \$1,000,000, through a number of years, and was successfully growing more than 2000 rubber trees introduced about 17 years before, after the rubber corner of 1922 Heels of rubber from this plantation were being tested in Washington. The trees had apparently not suffered severely from cold spells, but the problem how to raise rubber in competition with the cheaply produced East Indian article had still to be solved. In the Everglades, the scanty remnant of the Seminole tribe that had never formally submitted to the authority of the United States were visited by Federal agents in October and persuaded to register for the military draft. See **ROADS AND STREETS**.

**Elections.** Florida's elections of State candidates were virtually settled, in the absence of any formidable Republican vote, at the Democratic primaries in May. U.S. Senator Charles O. Andrews was chosen to retain his office for six years more, but it required a run-off primary to assure his re-nomination. Spessard L. Holland, nominated by the Democratic vote for Governor, was elected unopposed in November. Both Andrews and Holland prevailed in the primaries over opponents put up by the Townsend old-age-pension organization.

At the general election (November 5) the State cast a popular vote for Roosevelt (Dem.) as President, and against Willkie (Rep.) by about 3 to 1 and formally elected the State's Democratic nominees, as named above. Presidential vote: Dem., 360,407; Rep., 126,412. Except one railroad-commission seat, unopposed Democrats won all State offices.

The voters dealt on November 5 with six proposed amendments to the State constitution: they gave majorities in favor of five—to forbid the State's taxing property, save intangible, ad valorem; to let the Legislature create a system of parole; to allow any excess over the expected collection of the State's levy on pari-mutuels to go to the counties; to add a seventh member to the State Supreme Court; and to exempt \$500 of every widow's property from taxation; an amendment to let the Legislature create a system of electing county commissioners according to districts was defeated.

**Officers.** Florida's chief officers, serving in 1940, were: Governor, Fred P. Cone (Dem.); Secretary of State, R. A. Gray; Attorney General, George Couper Gibbs; Comptroller, J. M. Lee; Treasurer, W. V. Knott; Commissioner of Agriculture, Nathan Mayo; Superintendent of Public Instruction, Colin English.

**FOOD AND DRUG ADMINISTRATION.** Most of the legal actions taken by the Food and Drug Administration during the fiscal year 1939-40 were for violations of the Food, Drug, and Cosmetic Act of 1938, though this new consumer statute did not completely supersede the pioneer pure-food law of 1906 until July 1, 1940.

Enforcement of the new measure brought Federal regulation in several new fields, notably cosmetics, therapeutic devices, and containers. Numerous seizures of harmful beauty preparations in 1938-39 together with continuous surveillance of the industry quickly forced the few manufacturers who made such products to eliminate potentially dangerous ingredients from their formulas with the result that only one seizure of a dangerous cosmetic was necessary in 1940. It involved an eyelash and brow dye containing a poisonous coal-tar color.

On the other hand, more than 2,000,000 lb. of coal-tar colors were certified by the Administration as harmless and suitable for use in foods, drugs, and cosmetics.

Thirty-four shipments of devices bearing false and misleading curative claims were seized during the year. Most of them were therapeutic lamps, heat and light applicators, or other electrical gadgets offered as treatments for such serious disorders as kidney and heart disease, eczema, abscesses, gangrene, varicose veins, asthma, ulcers, rheumatism, Bright's disease, and diabetes. Next in number were vaporizers and inhalers for respiratory diseases, as well as other worthless or harmful contraptions.

Deceptive containers brought about the seizure of 145 shipments of tooth paste, cosmetic creams, face powders, cheese, spices, candy, ice cream, alimentary pastes, tea balls, cookies, nose drops, bandages, and adhesive tape.

Another project under the new law was the promulgation of legal standards for several foods, including tomato products, egg products, and various canned fruits and vegetables. Hearings were also held on the standards proposed for many other kinds of food. Eventually, of course, the entire food field will be covered.

Thanks to the increased power afforded by the new law to control sanitary conditions in the factory, the Administration was able to stop certain offensive practices carried on by a small minority, especially in the production of candy and shelled pecans.

The new requirements for more informative labeling brought about vast changes in the composition and labeling of drug products during the year. Dangerous drugs had virtually been driven from the market by the many seizures made the previous year. Work with new drugs, for which applications must be filed with the Government to establish that these products are safe for use, was continued in increased volume.

Marked changes for the better were noted in various branches of the food industry. As for the food-poisoning cases investigated by the Adminis-

tration, with one exception those due to botulism involved home-canned food. Seventeen cases of another type were caused by "tenderized" ham.

These activities, of course, represent but a few of the aspects of the Administration's work in protecting the consumer under the Food, Drug, and Cosmetic Act. As usual the Administration also enforced the Insecticide Act, the Caustic Poison Act, Import Milk and Filled Milk Acts, Tea Act, and the Naval Stores Act.

WALTER G. CAMPBELL.

**FOOD STAMP PLAN.** See SURPLUS MARKETING ADMINISTRATION; also DAIRYING.

**FOOTBALL.** The gridiron continued its unshakeable hold on the public mind in 1940 and the game showed no deterioration in the quality of the playing.

Huge crowds, exciting games, astounding reversals of form and ruling, and an unusual series of mistakes in score-keeping, all combined to keep the collective public pulse in high speed. On one occasion a post-mortem examination of a close play resulted in the reversal of the final score two days after the game had ended.

In one of the most colorful sporting spectacles in history, and on the golden anniversary of their first gridiron conflict, Navy defeated Army 14-0 at Philadelphia's Municipal Stadium before a crowd of 102,000 persons.

Another exciting contest was the Cornell-Pennsylvania smash-up before 80,000 spectators in Franklin Field, one of the most nerve-wracking sessions of the season, with Penn emerging victor after yielding 13 points in the first seven minutes of the game. The triumph made Pennsylvania the champion of the Ivy League.

Stanford was the surprise team of the year and qualified for Rose Bowl honors with a climactic victory over California at Berkeley. The triumph established Clark Shaughnessy as the miracle performer of the year. Coming from Chicago, he succeeded to the leadership of an aggregation that had won only a single game in 1939 and by some mysterious power and tactical equipment he piloted the team through a campaign in which it never met defeat. In that respect, Stanford shared honors with only four other major teams. The others were Minnesota, which was generally considered the top team of the year; Tennessee, which finished its third successive regular schedule without upset; Boston College, the No. 1 eleven of the East; and Lafayette.

Outstanding elevens of the season included Michigan and Northwestern in the Middle West, Pennsylvania and Cornell in the East, Washington on the Pacific Coast, and Texas, Rice, and S.M.U. in the South. Michigan had one of the finest aggregations of the year; and in Tom Harmon the Wolverines had one of the greatest backs in the history of football. In his final appearance of the season, he broke the 15-year-old record of the unforgettable Red Grange.

Cornell, unconquerable in 18 games, was finally vanquished by Dartmouth in one of the strangest

denouements in the memory of football fans. In the final play of the game, Cornell made an apparent touchdown and was acclaimed the victor. Motion pictures, however, showed that the pass had been made on an illegal fifth-down. The referee acknowledged the error two days later; and Cornell conceded its defeat by a score of 3-0.

Notre Dame, after a brilliant start, which included the defeat of Army, was beaten by Iowa and Northwestern. In its first upset in three years, Georgetown was downed by Boston College 19-18, after leading by 10 to 0. Penn State experienced the sensation of meeting its first defeat in the final game of the season, losing to Pittsburgh. Though vanquished several times, Harvard, Columbia, and Dartmouth had remarkably strong teams; and other creditable elevens were those of Navy, Temple, Pittsburgh, Princeton, Colgate, and Syracuse.

The post-season games played on New Year's Day 1940 resulted as follows: Rose Bowl (Pasadena, Calif.): Southern California 14, Tennessee 0; Sugar Bowl (New Orleans, La.): Texas A. and M. 14, Tulane 13; Orange Bowl (Miami, Fla.): Georgia Tech 21, Missouri 7; Sun Bowl (El Paso, Tex.): Catholic University 0, Arizona State of Tempe 0; Cotton Bowl (Dallas, Tex.): Clemson 6, Boston College 3.

The corresponding events played one year later, on New Year's Day 1941, produced the following results:

Rose Bowl: Stanford 21, Nebraska 13; Sugar Bowl: Boston College 19, Tennessee 13; Orange Bowl: Mississippi State 14, Georgetown 7; Sun Bowl: Western Reserve 26, Tempe (Ariz.) Teachers 13; Cotton Bowl: Texas A. and M. 13, Fordham 12.

Professional football continued to command the serious attention of the American public. One of the sensational events of the season was the massacre of the Washington Redskins by the Chicago Bears by the astronomical score of 73 to 0. In the early part of the season the Redskins won seven straight and seemed destined for championship honors. Their success was short-lived, however, and in November, after defeating the Bears 7-3, they were definitely headed downhill. They were humbled by the Brooklyn Dodgers and also by the New York Giants. Then the race tightened and the Redskins, by an effort born of sheer determination, managed to beat the Philadelphia Eagles 13 to 6 and capture the laurels of the eastern division.

In the west, the Chicago Bears and the Green Bay Packers ran neck and neck till the very end, the former taking final honors. The play-off between the Washington Redskins and the Chicago Bears, representing the eastern and western divisions respectively, occurred on December 8 in Griffith Stadium before a crowd of 36,034 persons who paid some \$102,280 to watch the slaughter.

**FOREIGN EXCHANGE.** See INTERNATIONAL BANKING AND FINANCE; the countries under *Finance*.

**FOREIGN RELATIONS.** See UNITED STATES under *Foreign Affairs* and the foreign countries under *History*; also, PAN AMERICANISM.

**FORESTRY.** Because of the sharp demand for lumber for construction of barracks and other uses incident to the defense program, there was a notable increase in lumber output in 1940 over that of the preceding year. As a result, lumber prices rose sharply, to the detriment of home building and other ordinary domestic uses. As emphasized

by Earle H. Clapp, Acting Chief of the Forest Service in his annual report to the Secretary of Agriculture, forests are unlike many of our natural resources. With planned management and protection, the forests can be continuously harvested. At present, the nation is not making adequate provision for the perpetuation of the forests. Approximately three-fourths of the commercial forest areas are in private ownership. The Forest Service stressed the need of public co-operation and aid to private owners and urged that private owners be encouraged to co-operate by effecting reasonable practices that would aim toward sustained production. At the present time, more than 85 per cent of the 202 million acres in private ownership lack forest management of any kind. Of some one million industrial and non-farm owners, only 215 are operating on a sustained yield basis and the properties so managed represent less than 11.5 million acres. Forests are so vital to the welfare of the nation, both in time of peace and war, that their constructive management is a matter of primary concern to the American people.

**Lumber Production.** Based on figures released by the National Lumber Manufacturers Association, Washington, D.C., there was a considerable increase in lumber production in the United States in the calendar year 1940 as compared with 1939. The data, in board feet, are shown in the accompanying table.

Month	1939 (Board feet)	1940 (Board feet)
January..	1,782,200,000	1,899,471,000
February..	1,637,400,000	1,823,576,000
March..	1,922,700,000	1,988,497,000
April..	1,968,300,000	2,151,887,000
May..	2,234,900,000	2,433,522,000
June..	2,251,600,000	2,217,113,000
July..	2,143,400,000	2,321,597,000
August..	2,400,800,000	2,489,724,000
September..	2,303,100,000	2,439,702,000
October..	2,362,500,000	2,743,397,000
November..	2,250,300,000	2,288,381,000
December..	2,001,800,000	2,169,820,000

**Lumber Trade.** An analysis of data in the October, 1940, Monthly Summary of Foreign Commerce of the United States, published by the U.S. Department of Commerce, shows a distinct upward trend in the values of both export and import items as compared with those of the preceding year. The total values for the 10 months ended October 31 were as follows: Imports: 1940, \$210,918,427; 1939, \$204,539,707. Exports: 1940, \$134,113,177; 1939, \$80,571,184. A breakdown for 1940 shows the following:

	Imports	Exports
Wood, Unmanufactured .....	\$ 6,877,059	\$ 2,249,107
Wood, Sawmill Products .....	19,274,512	31,244,315
Wood, Manufactures .....	9,537,285	16,904,011
Paper Base Stocks .....	65,117,330	27,809,308
Paper and Manufactures .....	110,112,241	55,906,436

The very important item of paper (q.v.) and manufactures is indicated and under imports includes the vast amount of news print obtained from Canadian sources.

**Public Forests.** According to the 1940 Report of the Chief of the U.S. Forest Service, there are 196 million acres of publicly owned forest land in the United States outside Alaska. Community forests owned by villages, towns, cities, and counties total about 8 million acres. State forests include approximately 19 million acres. The balance

of 169 million acres was in the National Forests. With forest lands outside continental United States included, the National Forests embraced on June 30, 1940, 176,567,095 acres owned or in process of acquisition as compared with 175,843,405 acres at the end of the preceding fiscal year. The great significance of nationally owned forests rests not only in their production of lumber on a sustained basis but also in their value for protection of water resources, their recreational facilities and the inclusion of vast grazing areas that are managed also on a sustained basis. Under systematic forest fire protection, the national forests have a fine record in keeping losses at a minimum, despite the fact that millions of citizens utilize these forests as a source of recreation and restful vacations.

**Forest Protection.** A most interesting development in forest fire control in 1940 was the greatly expanded use of airplanes and trained parachute jumpers for the suppression of fires in remote areas lacking in roads or accessible trails. Prompt attack on forest fires is a potent factor in reducing potential losses. Education through the facilities of the radio, motion pictures, and public press was actively pursued in an attempt to reduce man-caused fires. The Civilian Conservation Corps, with 322 camps on National forests, 176 on State forests, and 101 on privately owned forest land, again constituted a most important arm of defense in the reduction and suppression of forest fires. In addition to direct fire fighting, the CCC aided greatly by the construction of roads and trails, reservoirs, and the like. See CIVILIAN CONSERVATION CORPS; LAND UTILIZATION, OFFICE OF; SOIL CONSERVATION SERVICE.

Working through the Northeastern Timber Salvage Administration, the U.S. Forest Service aided in the disposal of timber and pulpwood resulting from the disastrous September, 1938, hurricane. Fire hazards in New England were reduced by the systematic disposal of limbs and brush.

In the Pacific Northwest, control of white pine blister rust was actively pursued by the destruction of wild currant and gooseberry bushes, on the leaves of which the disease passes an essential part of its life. The task is tremendous, with over a million and a half acres of western white or sugar pine lands from which the alternate host plants must be eradicated.

**Publications.** Through the public press and journals such as *American Forests*, conservationists continued to press actively the great need of preserving our American forests and of acquainting the public with forest species and their uses. The U.S. Forest Service published *Forest Outings*, a finely illustrated book of 311 pages devoted to outstanding features of the National Forests, particularly from the viewpoint of recreational possibilities.

J. W. WELLINGTON.

**FORMOSA (TAIWAN).** An island near the southeast coast of China, ceded to Japan by China in 1895. Total area, including the Pescadores, 13,889 square miles. Total population (1937 estimate), 5,609,000. Chief towns: Taihoku (the capital), 278,446 inhabitants in 1935; Tainan, 111,959; Keelung, 84,978; Takao, 83,735. The chief agricultural products are rice, sugar, tea, sweet potatoes, ramie, jute, and tumeric. Camphor is obtained from the forests under a government monopoly. Livestock (1937); 1,849,195 swine, 282,101 buffaloes, 76,341 cattle, and 70,384 goats. Gold,

silver, copper, and coal are the main mineral products. Trade (1938): Imports, Y366,659,000; exports, Y456,454,000 (yen averaged \$0.2845 for 1938; \$0.2596 for 1939). Budget (1939-40): Revenue and expenditure were estimated to balance at Y208,602,000. Governor General, Adm. Kiyoshi Hasegawa who succeeded Adm. Seizo Kobayashi on Nov. 26, 1940. See JAPAN under History.

**FOUNDATIONS.** Construction procedure on foundation work must often be changed as work progresses, due to unexpected conditions encountered. With good bearing material found only at a depth of 90 ft. under the site for the west pier of the new Black River bascule bridge at Lorain, Ohio, it was planned to sink cylinders of steel plate, 8 and 12 ft. in diameter, to this depth and fill them with concrete to form supporting piers. This was to be done within a cofferdam. But as conditions appeared to be favorable for pile driving, it was decided to make the cylinders by driving steel sheet piles. However, obstructions that had not been revealed by borings led to the use of steel piles instead of the shafts and piers. Curious behavior of some Mississippi River bridges seems to indicate that piers founded in the deep bed of soft clay and silt will rise and fall slightly with change in level of the water, but the records are not complete enough to be reliable.

Steel H-beam piles 194 ft. long, the longest ever driven, were used in the foundations for the concrete piers of the Potomac River bridge at Ludlow Ferry, Md., and also as combined foundation piles and trestle posts of the viaduct approaches. Some of those under the river piers were driven until their tops were 80 ft. below water. They were made in two pieces, one being 115 ft. long and the other making up the desired length, the two being connected by riveted splices. In the trestles, the part above ground is cased in concrete. Steel piles of Z-section have been used to build up hollow piers which are filled with concrete.

Wood piles 150 ft. long were used under the new Post Office building at San Francisco. The maximum length of single piles was 126 ft., requiring special construction of pile drivers to handle them. For greater lengths, two piles were put end to end, with steel dowels and barbed grids between them, the joint being spliced by an 18-in. length of 10-in. steel pipe. Of the 4000 piles used, about 2500 were spliced.

Foundations of large buildings have presented many interesting features and difficult problems. To provide against expected unequal settlement under different parts of the New England Mutual Life Insurance Building at Boston, Mass., due to varying character of soil materials, the foundations were made so stiff as to distribute the load over the softer spots. The concrete foundation walls were made as girders of reinforced concrete. Foundation design for the new building of the Aetna Casualty & Surety Company, in New York, was complicated by rapid-transit subways on two sides. As rock was too deep to be reached economically, spread footings on piles were used in the interior area. Along the sides adjacent to the subways, however, the foundations consist of steel pipes driven as piles to a depth below the subway level and then filled with concrete.

A troublesome foundation problem arising from the construction of the Chicago rapid-transit subways at a deep level in the clay formation, is the effect of the excavation of these tunnels upon many buildings which have shallow or spread founda-

tions. Movement of the clay and drainage of contained water is bound to occur and may endanger foundations built near the surface of the soil. In anticipation of such troubles, many buildings, large and small have been pulled down, as their value would not warrant the cost of building new foundations. Notable among these are the 23-story Capitol Building, and the 14-story Great Northern Hotel, the latter built in 1892 and pulled down in 1940. Some of the wrecked buildings have been replaced by two-story structures having rental value sufficient to pay their taxes. In other cases, the sites are utilized as parking areas for automobiles. The general effect is a marked change in the appearance of the business district, since some notable "skyscrapers" and many old buildings of moderate height have disappeared.

An exception to the policy of abandonment is the 17-story Monadnock Block, 66 × 400 ft. in plan and 216 ft. high. The old foundations were brick piers on grillage mats or footings consisting of six or seven layers of steel rails embedded in a deep slab of concrete, about 15 ft. below the street level. Its longer side fronts on Dearborn St., which is the route of a subway line. To establish a sure foundation on this side, the old footings of the columns were underpinned and held on jacks while shafts were sunk beneath them to rock at about 60 ft. below the street and 25 ft. below the floor of the subway. These shafts, 4 to 5½ ft. in diameter and belled out at the bottom to 9½ or 13½ ft., were filled with concrete to form piers supporting the old foundations.

In recent years much progress has been made in earthquake-resistant buildings and their foundations. A 1940 example is the Hoover Library of War and Peace at Stanford University, in California. This building, situated near an active geological "fault," consists mainly of a 16-story steel-frame tower 52½ ft. square and 280 ft. high, with reinforced concrete walls and containing several floors of book racks. Its foundation is a massive slab of reinforced concrete 61 ft. square and 5½ ft. thick. A two-story building around the base of the tower has independent footings for its columns, on the sand and gravel formation.

Pneumatic or compressed-air caissons are applied to an unusual purpose in forming the deep foundations for the cut-off or core wall in the Merriman earth dam for the Delaware River water supply of New York. There are 18 caissons in a row, mainly 45 × 12 ft. in plan, and the highest is 169 ft., penetrating 136 ft. below the bottom of the cut-off trench.

E. E. RUSSELL TRATMAN.

**FOUNDATIONS AND TRUSTS.** See **BENEFACTIONS.**

**FRACTURES,** Compound. See **MEDICINE AND SURGERY.**

**FRANCE.** A country of western Europe. As a result of the German invasion of 1940, the capital was transferred successively from Paris on June 10 to Tours, Bordeaux, Clermont-Ferrand, and Vichy. German and Italian troops remained in occupation of a large part of France from the commencement of the armistice on June 26 until the end of the year.

**Area and Population.** The area at the beginning of 1940 was 212,722 square miles. It was reduced during the year by 5605 square miles to approximately 207,117 square miles as a result of the annexation by Germany of the departments of

Bas-Rhin, Haut-Rhin, and Moselle, the former German provinces of Alsace and Lorraine. The population of France on Jan. 1, 1939, was estimated at 41,980,000. The population of Alsace-Lorraine in the 1936 census was 1,915,627. See *History* below. Live births in 1938 numbered 612,138 (14.6 per 1000); deaths, 646,879 (15.4 per 1000). Live births in the first six months of 1939 totaled 312,652 (14.9 per 1000); deaths, 350,369 (16.7 per 1000). Populations of the chief cities at the 1936 census were: Paris proper, 2,829,746; Marseille, 914,232; Lyon, 570,622; Bordeaux, 258,348; Nice, 241,916; Toulouse, 213,220; Lille, 200,575; Nantes, 195,185; Strasbourg, 193,119; Saint-Étienne, 190,236; Le Havre, 164,083; Toulon, 150,310; Rouen, 122,832; Nancy, 121,310; Reims, 116,687; Roubaix, 107,105; Clermont-Ferrand, 101,128.

**Colonial Empire.** The colonies, protectorates, dependencies, and mandated territories of France had a total area of some 4,617,579 square miles and a total estimated population of 70,000,000 in 1938. See the separate articles in this *YEAR BOOK* covering each of the following divisions: ALGERIA; CAMEROON, FRENCH; FRENCH EQUATORIAL AFRICA; FRENCH GUIANA; FRENCH INDIA; FRENCH INDO-CHINA; FRENCH WEST AFRICA; GUADELOUPE; MADAGASCAR; MARTINIQUE; MOROCCO; NEW CALEDONIA; NEW HEBRIDES; OCEANIA, FRENCH; RÉUNION; ST. PIERRE AND MIQUELON; SOMALILAND, FRENCH; SYRIA AND LEBANON; TOGO, FRENCH; and TUNISIA.

**Religion and Education.** With the exception of about 1,000,000 Protestants and a few thousand Jews, the French people profess the Roman Catholic faith. At the 1931 census there were 2,286,273 persons of five years or over (7 per cent of the total) unable to read or write. The school enrollment was: Elementary (1937-38), 5,436,554; higher elementary (Nov. 15, 1937), 257,597; secondary (November, 1938), 268,043; universities (July 31, 1938), 74,832.

**Agriculture.** About 38 per cent of the working population is directly supported by agriculture, 31 per cent by industry, and 11.5 per cent by commerce. There were 50,148,088 acres of arable land (36.84 per cent of the total) in 1937. Yields of the chief products in 1938 in metric tons except where otherwise indicated were: Wheat, 7,800,000 (1939); rye, 811,100; barley, 1,290,800; oats, 5,457,400; corn, 578,600; potatoes, 17,314,500; beet sugar, 930,000 (1939); olive oil, 4800; wine, 61,000,000 hectoliters. Livestock on Jan. 1, 1939, comprised 2,692,000 horses; 135,000 mules; 185,000 asses; 15,622,000 cattle; 9,872,000 sheep and lambs; 7,127,000 pigs; 1,416,000 goats.

**Mining and Manufactures.** Mineral and metallurgical production in 1938 in metric tons was: Coal and lignite, 47,557,000; iron ore, 10,100,000; pyrites, 147,000; potash (K<sub>2</sub>O content), 582,000; bauxite, 683,400; pig iron and ferroalloys, 6,049,000; steel ingots and castings, 6,174,000. Silk production (1939) was 41 metric tons; rayon, 25,500 metric tons; alcohol (1937), 109,701,000 gal.; vessels launched, 47,700 gross tons (1938).

**Foreign Trade.** Merchandise imports in 1938 were valued at 45,981,000,000 francs; exports at 30,586,000,000. For the first eight months of 1939, imports were 32,539,000,000 francs; exports, 23,832,000,000 francs. For distribution of trade in 1937 and 1938, see the 1939 *YEAR BOOK*.

**Finance.** Civil budget revenues for 1939 were 63,657,000,000 francs and expenditure appropriations 106,377,000,000 francs. Defense appropri-

tions, covered entirely by borrowings, totaled about 80,000,000,000 francs. The aggregate deficit was thus about 123,000,000,000 francs, or approximately \$3,000,000,000 at the average exchange rate of \$0.0251 for 1939. Civil budget estimates for 1940 placed revenues at 79,951,183,112 francs; expenditures, 79,889,137,098 francs. At the beginning of 1940, the defense budget for that year was estimated at 249,000,000,000 francs, all of which was to be borrowed; it was almost equivalent to France's entire national income in 1939. The French Treasury reported the total public debt on Aug. 31, 1939, at 445,000,000,000 francs. See *History*.

**Transportation.** The French railway network, comprising seven large systems with about 26,427 miles of line, incurred an aggregate deficit averaging about 2,500,000,000 francs annually previous to the European War. On Mar. 14, 1940, the Minister of Public Works reported that the railways were operating with a small excess of receipts. Highway mileage (1939), 393,761 (see *ROADS AND STREETS*). Inland waterways carried 45,006,000 metric tons of freight in 1938. Operating statistics of Air France, which virtually monopolized air transport, were for 1939: Length of services, 27,823 miles; miles flown, 5,838,917; passengers, 91,469; mail, 1,774,243 lb.; freight and excess baggage, 1,897,718 lb. Previous to the European War (q.v.) the leading ports by volume of freight handled were Marseille, Le Havre, Cherbourg, Dunkirk, Rouen, Boulogne, and Bordeaux. In June, 1939, the French merchant marine had a gross tonnage of 2,952,975.

**Government.** Under the Constitution of 1875, with its amendments, executive power was vested in the President, acting through a ministry selected by him but responsible to Parliament. Legislative power was vested in the Chamber of Deputies and the Senate, members of which jointly elected the President for seven years. The Senate in 1940 had 314 members, all 40 years or more of age and chosen by electoral colleges in each department for nine years, with one-third retiring every three years. The Chamber of Deputies had 618 members, elected by direct manhood suffrage for four years. President, Albert Lebrun (re-elected Apr. 5, 1939). The Cabinet at the beginning of 1940, headed by Edouard Daladier (Radical Socialist), was appointed Apr. 10, 1938, and reorganized on a war basis Sept. 13, 1939. The chief members were: Premier, Minister of National Defense, War and Foreign Affairs, Edouard Daladier (Radical Socialist); Armaments, Raoul Dautry; Blockade, Georges Pernot (Socialist and Republican Union); Justice, Georges Bonnet (Radical Socialist); Interior, Albert Sarraut (Radical Socialist); State, Camille Chautemps (Radical Socialist); Finance, Paul Reynaud (Radical Socialist); Colonies, Georges Mandel (Independent Republican); Education, Yvon Delbos (Radical Socialist); Air, Guy La Chambre (Radical Socialist); Navy, César Campinchi (Radical Socialist); Public Works, Anatole de Monzi (Independent Socialist); Commerce, Fernand Gentin (Radical Socialist); Agriculture, Henri Queuille (Radical Socialist); Transport, Jules Julien (Radical Socialist); Labor, Charles Pomaret (Socialist and Republican Union). For political changes during 1940, including the overthrow of the Republic in July, see *History*.

#### HISTORY

At 6:50 p.m. on June 22, 1940, Gen. Charles Huntziger of France and Col. Gen. Wilhelm Keit-

el, chief of the High Command of the German armed forces, signed an armistice that marked the most humiliating setback for France since the end of the Napoleonic wars.

The French peace delegation was received on June 21 by Adolph Hitler in the same railway dining car in the same spot in the forest of Compiègne, France, where General Foch, commander-in-chief of the Allied armies, received the unconditional surrender of the Germans on Nov. 11, 1918. There the armistice was signed the following day. On June 24 France also capitulated to Italy; General Huntziger, as head of the French peace negotiators, signed a Franco-Italian armistice pact in the Villa Incisa 12 miles from Rome. Both agreements went into effect, and simultaneously fighting stopped, at 12:35 a.m. (French time) on June 25. The armistice reduced France to impotence, leaving her virtually at the mercy of the Rome-Berlin Axis.

France's surrender followed the crushing defeat of her armies in two great battles that began with the German invasion of Belgium, Luxemburg, and the Netherlands on May 10. Her fate was sealed when Italy entered the war on June 10 while French defense lines before Paris were crumbling under the fierce assault of German armored divisions. See *EUROPEAN WAR* for a complete account of the military operations.

**Armistice Terms.** The armistice agreements (see p. 231) exacted from France every concession that might be useful to Germany and Italy in prosecuting their struggle with Britain. German troops occupied more than half of France, including the entire coast on the English Channel and the Atlantic (see map on p. 232). This area comprised all the coal mines and virtually all the war industries of France. All factories, mines, and transportation facilities in this region were placed at the disposal of the occupying forces. Germany and Italy held all French war prisoners pending conclusion of a permanent peace, but France was required to release its war prisoners and also all German and Italian subjects, particularly refugees, designated by the victors. Moreover the Reich reserved the right to denounce the armistice if, in the judgment of the German Government, France did not fulfill all of its terms.

**Political Developments.** The collapse of French military defenses was accompanied by the fall of the Third Republic, born during the travail of the Franco-Prussian War. It not only discredited the parliamentary system and the politicians charged with responsibility for maintaining French security, but also opened the pathway for the ascendancy of the Fascist, pro-German and pro-Italian elements in France and the crushing of Leftist political influence. Coincidentally there began a reorientation of French foreign policy that brought the government into closer collaboration with France's victorious foes—in the hope of obtaining more favorable peace terms—while widening the rift with Britain that began with the French capitulation to Hitler.

Premier Daladier, by utilizing the extensive powers granted his government by Parliament in 1939 (see 1939 *YEAR BOOK*, p. 287 f.), managed to curb political and class antagonisms during the first part of 1940 and to present what seemed like a united front to the enemy. The censorship was further tightened and other repressive measures taken to end the defeatist and pacifist propaganda assiduously circulated by German agents and sym-

pathizers on the one hand and by Communists and pacifists on the other. On January 25 the ban against expressions tending to weaken French morale was extended to remarks made in public or on posters and placards. Severe measures were taken to curb the activities of spies and traitors. Dr. Karl Roos, leader of a pro-German Alsatian autonomist movement, was executed for espionage on February 7.

**Drive on Communism.** The government's drive against communism was extended. In mid-January both houses of Parliament by overwhelming majorities passed a law excluding Communist representatives from Parliament and from municipal offices throughout France. Those Communists who publicly repudiated their party's policies before Oct. 26, 1939, were exempted. Expulsion of 60 of the 72 Communist members of the Chamber of Deputies was consummated on February 20. On March 19 Minister of Interior Albert Sarraut reported to the Senate that in addition to the 60 Deputies, 2778 Communist members of municipal councils had been suspended, 620 Communist labor unions dissolved and 675 other Communist organizations banned. In all, 3400 Communist agitators had been arrested up to March 7, he said.

After a secret trial, 36 Communist Deputies who signed a letter to Edouard Herriot, Speaker of the Chamber, urging acceptance of Hitler's peace terms in the fall of 1939, were sentenced on April 3 to five-year prison terms, fines, and loss of civil rights for five years. Eight others, who fought for France in the World War, received suspended sentences. On May 3 some 200 Communist leaders were interned on islands off the French west coast. Nazi sympathizers and agents also came in for severe punishment, particularly during May and June when France was fighting with her back to the wall. Five Paris newspapermen were arrested June 5. There were numerous executions of French and foreign spies. Many of the latter entered France among refugees from Belgium and the Netherlands and played an important role in disrupting French communications and morale.

**Fall of Daladier.** In the effort to end defeatist and pro-German propaganda and to prevent the Germans from obtaining useful information, the censorship was administered with a rigidity that had unfortunate effects upon the French people at large. Little information was given to Parliament or the public concerning the administration and progress of the war. The resulting restlessness found expression early in February in demands from many Deputies for a report on the progress of armament industries, on military operations, and on the government's economic and foreign policies.

Premier Daladier sought to still this unrest by giving the desired information to the committees of the Chamber. But the Deputies were not satisfied and on February 9 they voted 262 to 227 for a secret session of the Chamber to hear a full explanation of the government's war policies. M. Daladier's convincing statement of his government's progress earned him a 534-0 vote of confidence in the Chamber on March 10 after a two-day debate. The resolution expressed the Chamber's confidence in ultimate victory. But belief in Allied supremacy, and with it the fortunes of the Daladier Government, soon began to wane.

A parliamentary barrage of criticism against the inept handling of the censorship led Daladier

on February 27 to create a Ministry of Public Information for the co-ordination of published information, broadcasting, propaganda, and censorship. With the signing of the Finnish-Soviet peace treaty on March 12 and the consequent German diplomatic and strategical gain, criticism of Daladier's conduct of the war gained strength. On March 16 he obtained a vote of confidence in the Senate, 240 to 0, after another secret debate, but 60 Senators under the leadership of former Premier Pierre Laval abstained as an expression of their disapproval. Laval was said to have demanded a "white peace" with Germany "to offset the Red danger."

The Socialists on the Left and the Republican Federation on the Right seized the opportunity to press for representation in the Cabinet, which was largely composed of Radical Socialists. There was also sentiment for more aggressive prosecution of the war. The impression began to gain ground that while the French army was sitting tight behind the Maginot Line at a cost of a billion francs daily, the Allied cause was losing ground on the diplomatic, military, and economic fronts. On March 19, in another secret session of the Chamber, only 239 Deputies voted to support Daladier while 300 abstained. The Premier immediately presented the resignation of his cabinet.

**Reynaud Cabinet Formed.** President Lebrun called upon Paul Reynaud, the politically independent Minister of Finance in the Daladier Ministry, to form a new cabinet. Reynaud was an ardent foe of those elements in France favoring further appeasement of Hitler and a compromise peace. He had handled France's difficult financial problems with exemplary vigor and success. He proceeded energetically to form a new government with wider political backing—seven parties from the Socialists on the Left to the right wing of the Center were represented—and to reorganize the cabinet system for more efficient prosecution of the war on all fronts.

The composition of the Reynaud Ministry formed March 21 was as follows: Premier and Foreign Minister, Paul Reynaud; Vice Premier, Camille Chautemps (Radical Socialist); National Defense and War, Edouard Daladier (Radical Socialist); Justice, Albert Sérol (Socialist); Interior, Henri Roy (Radical Socialist); Finance, Lucien Lamoureux (Radical Socialist); Information, Louis-Oscar Frossard (Republican Socialist); Navy, César Campinchi (Radical Socialist); Air, Laurent Eynac (Left Democrat); Education, Albert Sarraut (Radical Socialist); Colonies, Georges Mandel (Independent Republican); Commerce and Industry, Louis Rollin (Left Republican); Public Works and Transport, Anatole de Monzie (Republican Socialist); Labor, Charles Pomaret (Republican Socialist); Merchant Marine, Alphonse Rio (Republican Socialist); Supplies, Henri Queuille (Radical Socialist); National Economy and Agriculture, Paul Thellier (Left Republican); Armament, Raoul Dautry (non-party); Public Health, Marcel Héraud (Republican Socialist); Pensions, Albert Rivière (Socialist); Blockade, Georges Monnet (Socialist).

A number of much-criticized members of the Daladier Cabinet were dropped from the Reynaud list, including Minister of Justice Georges Bonnet, advocate of appeasement, and Air Minister Guy La Chambre. In the interests of efficiency, the cabinet was divided into a War Committee of five; a War Cabinet composed of the Premier, Vice Pre-

mier, and Ministers of War, Navy, Air, Finance, Armaments, Blockade, and Colonies; and the Economic Committee to co-ordinate all economic activities, comprising the Ministers of Interior, Commerce, Agriculture, Public Works, Supply, and Merchant Marine.

The Reynaud Ministry got off to an inauspicious start. It was confronted from the start with the political opposition of the extreme Right, which was not represented, and of part of the Radical Socialists, who were resentful of the overthrow of the largely Radical Socialist Daladier Ministry and the loss of three key cabinet positions. There was also growing opposition from the appeasers led by Laval, Bonnet, and Pierre-Etienne Flandin while the underground Communist movement continued to give the government trouble. Reynaud scraped through the first test in the Chamber with a majority of only one vote but he proceeded to organize his government to "wage war in all fields." Nevertheless the strength of the opposition indicated that the Premier might be overthrown in secret hearings scheduled before the Senate on April 9 and before the Chamber on April 11-12. His overthrow would have greatly increased the demand for peace with Hitler on the basis of the status quo.

**Effect of Norway Campaign.** Before dawn of April 9 the Germans launched their surprise attack upon Denmark and Norway and the "sit-down war" that had done so much to sap French morale came to an end. Without a dissenting vote, both houses of Parliament decided to give the Premier a free hand to carry on during the Norwegian campaign. A week later, however, he was called upon to give a full report of his progress both at home and abroad. His statements before secret sessions of the Senate and Chamber did much to revive confidence and he received unanimously favorable votes in the Senate on April 18 and in the Chamber on April 19.

Little news of the Norwegian campaign reached the French people until May 2 when the disheartening announcement was made that the Allied forces had been evacuated from the Trondheim region. The Reynaud Government then came in for some of the criticism that forced the resignation of Prime Minister Chamberlain in Great Britain. The stability of the cabinet was again in danger when the German onslaught against Luxembourg, Belgium, and the Netherlands on the morning of May 10 inaugurated the decisive battles on the Western Front.

**The Struggle for Survival.** Again the parties and groups hostile to the government withheld their criticisms and temporarily abandoned their partisan maneuvers to support the government in meeting France's supreme test on the field of battle. Premier Reynaud moved to widen the government's support by adding to the War Cabinet as Ministers of State two extreme Rightists, Louis Marin (Republican Federation) and Jean Ybarnégary of the pro-Fascist French Social party. A month before their parties had refused to join the cabinet because of their unwillingness to co-operate with the Socialists.

Reynaud, with the support of a majority of the government, made heroic efforts to check the military debacle that began with the quick collapse of the Netherlands, the piercing of the main Belgian defense lines before Allied troops could reach their assigned positions, and the fatal German break through the French defense system along the

Meuse between Namur and Montmédy on May 15 (see EUROPEAN WAR). On May 16 Paris was placed under military rule and Premier Reynaud warned the Chamber of Deputies and the French people that new "methods and men" might be necessary. On May 18 he took over direct control of the War Ministry from Daladier, to whom he transferred the Foreign Affairs portfolio. The aged Marshal Henri Philippe Pétain, famous organizer of French resistance at Verdun in the World War, was called home from his Ambassadorship in Madrid to become Vice Premier and chief adviser to Reynaud in the conduct of the war. Georges Mandel, disciple of Clemenceau and an able administrator, was appointed Minister of Interior to carry out the Premier's orders that weakness be punished by death. Armament and airplane factories were placed on a 24-hour basis, while strong measures were taken against spies, saboteurs, and slackers.

On May 19 Gen. Maxime Weygand was hurriedly recalled from Syria to replace Gen. Marie Gustave Gamelin as commander-in-chief of all French armed forces. With the inexorable German advance continuing, Premier Reynaud told the Senate on May 21 the full story of the disaster that was overtaking French arms. "The truth is," he declared, "that our classic conception of warfare has run counter to a new conception. The basis of this conception is not only in the massive use of armored divisions and of fighting airplanes; it is in the disorganization of the enemy rear . . ." He declared the German forcing of the Meuse was achieved as a result of "unbelievable faults which will be punished." These revelations and Reynaud's appeal for a super-human effort to save France awoke the ill-informed nation from its complacency, but last-minute efforts to remedy the situation proved unavailing.

The surrender of the Belgian army by King Leopold and the defeat of nearly one-third of the Allied forces in the Battle of Flanders, which ended with the German capture of Dunkirk on June 3 (see EUROPEAN WAR), lent impetus to demands of defeatist elements for immediate peace negotiations. However Premier Reynaud resolutely rejected talk of surrender. On June 6, the day after the Germans launched their offensive against the hastily improvised Somme front, Reynaud reorganized his government to eliminate the defeatists and others. He took over the Foreign Affairs portfolio from Daladier, who was dropped, and named Jean Prouvost, France's leading newspaper publisher, as Minister of Information. Maj. Gen. Charles de Gaulle, long an unheeded advocate of mechanized warfare, became Reynaud's chief assistant in the War Ministry, and Paul Baudouin, president of the Bank of Indo-China, was chosen to assist the Premier in the Foreign Office. Albert Sarraut, Lucien Lamoureux, Anatole de Monzie, and Marcel Héraud were replaced by Yvon Delbos, Marcel Bouthillier, Louis Oscar Frossard, and Georges Pernot, respectively.

In the face of the steady German advance, the Premier made a final effort to rally all French forces to avert catastrophe. Ably aided by Minister of Interior Mandel, he took further measures to punish slackers, fifth columnists, and other pro-German elements. At the same time he named Eirik Labonne to the vacant French Embassy in Moscow in an effort to gain Soviet aid. The "miracle" for which Reynaud strove failed to materialize, however. On June 10 his government was forced to leave Paris for Tours. Italy entered the

war on the German side the same day, eliminating hope that the beaten French armies might make a successful stand in southern France. The attitude of Spain also became threatening. On the night of June 13 the government fled from Tours to Bordeaux, and the following day German troops occupied Paris.

**Fall of Reynaud.** These tragic events reinforced the peace faction in France. Members of the cabinet demanded that the Premier open negotiations for an armistice. Hoping to win sufficient American support to remain in office and prosecute the war to the bitter end, the Premier on June 10 sent a personal appeal to President Roosevelt for "material support by all means 'short of an expeditionary force.'" He declared that if his government were driven out of France "we shall establish ourselves in North Africa to continue the fight and if necessary in our American possessions."

By June 12 Reynaud's position was gravely endangered. President Lebrun presided over a cabinet session in the Château de Cange, Tours, that day. Premier Reynaud called in General Weygand, who in "the most dramatic meeting of any government in the French Republic's history" informed the ministers that the military position of the French armies was hopeless. The cabinet unanimously decided to ask Prime Minister Churchill to come to France for consultation. Churchill arrived at Tours on June 13, accompanied by Foreign Secretary Halifax, Lord Beaverbrook, Minister of Aircraft Production, and a cabinet secretary. They conferred with Premier Reynaud and Minister of Interior Mandel.

Reynaud asked the British Prime Minister to release France from her obligation not to open peace negotiations without Britain's consent. According to Churchill's account of this interview, given before the House of Commons on June 25, he refused his consent but agreed that if the United States failed to guarantee sufficient aid to enable Reynaud to continue the struggle, he would reconsider his decision. He also undertook to send all possible British aid to the hard-pressed French armies. According to a statement of the Pétain Government issued June 24, Reynaud informed the cabinet after his conference with Churchill that the latter had stated that Britain would not blame France if events forced her to seek an armistice.

That same evening Premier Reynaud (June 13) broadcast his final appeal to the United States for "clouds" of war planes. He frankly admitted that the Battle of France was lost and implied that France could not continue the war without the "hope of a common victory" through American aid. President Roosevelt replied on June 15 that his administration would redouble its efforts to supply the Allied war needs as long as they resisted, but that only Congress could make military commitments. He added that the U.S. Government would not recognize infringement by force of the "independence and territorial integrity of France."

On June 16 Reynaud advised Churchill that the President's response did not meet France's need. He again requested release from the Anglo-French agreement not to make a separate peace. The British Government's reply stated that while Britain was determined to continue the struggle, it would agree to French armistice negotiations provided the French fleet was sent to British ports and held there during the negotiations. Seeking to induce France to continue the war, the British a few

GENERAL DE GAULLE INSPECTING "FREE FRENCH" TROOPS IN LONDON

hours later formally proposed the "indissoluble union" of the British and French empires, with a constitution providing "joint organs of defense, foreign, financial and economic policies"; the conferring of British citizenship on all Frenchmen and French citizenship on all British subjects; joint responsibility for the repair of war devastation on their territories; a single war cabinet controlling all Anglo-French forces on land, sea, and air; and formal association of the British and French Parliaments.

This offer was rejected. Instead the Reynaud Cabinet, meeting again the same night, voted 13 to 11 in favor of concluding a separate peace. Reynaud immediately resigned and a new government headed by Marshal Pétain was formed to sue for peace. It included Camille Chautemps as Vice Premier, Generals Weygand, Louis Colson, Bertrand Pujo, and Adm. Jean Darlan as heads of the defense ministries, and other officials who had held posts in the two Reynaud cabinets.

On June 17 Marshal Pétain, whose support of Weygand's capitulation proposal had been decisive, announced to his stunned countrymen in a radio address that as Premier of France he had applied to Hitler the previous night for an honorable termination of hostilities. This appeal, forwarded through Gen. Francisco Franco of Spain, was made with full expectation that France's victorious enemies would demand Alsace-Lorraine, Nice, Savoy, and other border areas; Corsica; overseas colonies, and probably the French fleet as the price of peace.

Three high British cabinet and naval officials were rushed to Bordeaux by Prime Minister Churchill to remind the Pétain Government that the condition on which Britain agreed to release France from her alliance obligations—dispatch of the French fleet to British ports—had not been complied with. They received assurances from Admiral Darlan and other members of the government that the fleet would never be allowed to fall into German and Italian hands. Yet the Pétain Government, after some hesitation and debate, authorized General Huntziger to sign the armistice accords, providing among other hard conditions that the French fleet should be demobilized and disarmed under German or Italian control in ports to be specified by the victors.

According to officials of the Pétain Government, they surrendered for the following reasons: (1) To end the slaughter of French troops, the suffering of hordes of refugees driven before the advancing German armies, and the devastation of cities and towns in unoccupied France by German and Italian air raids, (2) to forestall the military occupation of all France and to maintain the government on unoccupied French soil in order to lead the nation through the trials awaiting it, and (3) because Britain and the other French allies were unable to give the aid needed to continue the struggle. Neutral observers asserted that the Pétain Government was composed of persons who believed an early German victory over Britain certain and that a pro-Axis policy was henceforth necessary in order to obtain more lenient peace terms from Hitler and Mussolini than would be possible if France fought to the bitter end with Britain. This view was supported by the inclusion in the government on the day after the Franco-German armistice was signed of former Premier Pierre Laval, who replaced Chautemps as Vice Premier, and Mayor Adrien Marquet of Bordeaux. Both were

known for their marked pro-Nazi and pro-Fascist leanings.

**Split over Armistice.** The Pétain Government's surrender and adoption of a pro-Axis orientation deepened the divisions among the French people. On June 20, while Premier Pétain's order to continue resistance until honorable peace terms were obtained was still in effect, a group of nearly 100 parliamentary leaders, opposed to surrender, sailed from Le Verdon near Bordeaux on the steamship *Massilia* for Casablanca, French Morocco. The group was headed by the ex-cabinet officers Daladier, Campinchi, Delbos, and Mandel. French authorities aided the ship's departure, arousing belief that the Pétain Government was seriously considering continuation of the struggle.

At Casablanca the parliamentarians were welcomed by Gen. Albert Noguès, Resident General of Morocco, who at first seemed disposed to continue the war. However he received orders to detain the *Massilia* and its passengers, and was won over to acceptance of the armistice by Gen. Henri Gouraud, whom Marshal Pétain sent post-haste to Casablanca on June 27. Meanwhile the British Government had sent General Lord Gort and Minister of Information Duff Cooper to Morocco to establish contact with Daladier and his associates and persuade them to fight on with Britain. Through some misunderstanding, they landed by seaplane at Rabat instead of Casablanca. The French authorities at Rabat displayed a hostile attitude and refused to allow the British representatives to get in touch with those on board the *Massilia*.

This convinced the British of the authenticity of a report—said to have been deliberately circulated by the Germans—that an agreement had been reached for the surrender of the French fleet at Oran. The British attack on the French fleet followed on July 3, ending all hope of forming a separatist government in North Africa. The parliamentarians on the *Massilia* were refused transport facilities by the Franco-German armistice commission when they sought to return to Vichy for the July 9-10 session of Parliament (see below). Some of the most prominent were later returned to France under arrest to face trials or court-martials.

Ex-Premier Reynaud also attempted to leave France in order to organize resistance in North Africa, but was turned back at the Spanish border and arrested. Thus the little-known Gen. Charles de Gaulle was left to assume leadership of the numerous Frenchmen at home and in the colonies who refused to accept the armistice and repudiated the Pétain Government. He had gone to London upon the collapse of the Reynaud Cabinet, in which he was Under-Secretary for War, and issued radio appeals to the French people to continue the struggle. On June 23 he announced the formation, in agreement with the British Cabinet, of a French National Committee in London to carry on the war in alliance with Britain. On June 28 the British Government formally recognized de Gaulle as "leader of all free Frenchmen, wherever they may be, who rally to him in support of the Allied cause."

General de Gaulle declared that France could not honorably surrender while the governments of Poland, Norway, the Netherlands, Belgium, and Luxembourg continued to fight as allies of Britain and while France had at her disposal a vast empire with large military forces, a formidable fleet, and a large gold reserve deposited in England and the

United States. In defiance of Pétain's orders, he recruited Frenchmen in Britain, the French colonies, and foreign countries to continue the struggle. The Pétain Government deprived him of his military rank on June 23 and on July 7 a military court in Toulouse sentenced him in absentia to four years in prison for disobeying orders and inciting soldiers to disobedience. On August 2 he was sentenced to death, also in absentia, for plotting against the State.

Punitive measures were taken against other French leaders, within and without France, for their refusal to accept the armistice. After several plots against the Pétain regime had been discovered, street assemblies and demonstrations were forbidden on June 24. However the bulk of the military and political leaders remaining in France rallied behind Marshal Pétain. Largely through the influence of General Weygand, Pétain overcame the strong opposition of French commanders in French Indo-China, Syria, Algeria, and Tunisia to the armistice and secured their pledge of allegiance.

**France Goes Totalitarian.** At the end of June, the Pétain Government moved from Bordeaux to Clermont-Ferrand and then to Vichy. On July 5, Pétain announced that he had designated his new Vice Premier, Pierre Laval, to draw up a constitution giving France an "ultra-modern version of democracy." On July 9, 398 out of the 618 Deputies in the Chamber and 226 out of 314 Senators met in Vichy and approved a draft resolution giving Marshal Pétain full power to promulgate a new constitution. The vote was 395 to 3 in the Chamber and 229 to 1 in the State. There was no debate on the resolution on July 9, but when it came before both houses meeting jointly as the National Assembly on July 10, opposition groups succeeded in inserting a provision for a national plebiscite on the new charter. The resolution was then formally enacted, 569 to 80. It was stipulated that the constitution "shall guarantee the rights of work, family and native country" and be "applied by the Assemblies which it shall create."

Under authority of this resolution, Marshal Pétain issued six Constitutional Acts establishing an authoritarian regime and repudiating the principles and abolishing the institutions which France derived from the French Revolution. By Act No. 1 (July 11), he assumed the functions of the head of the French State and repealed Art. 2 of the 1875 Constitution providing for the election of a President by the National Assembly. By Act No. 2 (July 11), he assumed virtually unlimited powers of administration and legislation, with the exception of the power to declare war. By Act No. 3 (July 11), he decreed that the Senate and Chamber should remain in existence until the Assemblies provided for in the Constitutional Law of July 10 were formed. The Senate and Chamber were ordered to adjourn until further order; they were to convene only at the call of the Head of the State.

By Act No. 4 (July 12), Marshal Pétain provided that Pierre Laval should automatically succeed him if he should be prevented from exercising his functions before ratification by the nation of the new constitution. If Laval were prevented from assuming the office, the Council of Ministers would assume the powers of the Chief of State until they designated someone to fill the post "by a majority of seven votes." Act No. 5 of July 30 provided for the establishment of a Supreme Court

of Justice. A supplementary law of the same date authorized the court to try officials for crimes, misdemeanors, or betrayal of duty and all persons charged with attacks against the security of the State; it was empowered to sit in secret session "whenever the public interest calls for it." All provisions of the 1875 Constitution contrary to these five Constitutional Acts were abrogated.

**The Dictatorship in Action.** In assuming dictatorial powers on July 11, Marshal Pétain in a radio broadcast to the nation declared that labor was France's "supreme resource," that "international capitalism and socialism exploited and degraded France" and must be excluded from the new order, that an "elite corps" of leaders must be created, and the family strengthened and preserved. He stated that the government was preparing to return to German-occupied territory and had requested "that Versailles and the ministerial quarters in Paris be vacated for us."

On July 12 he named a new cabinet with Laval as Vice Premier and the other Ministers as follows: Defense, Gen. Maxime Weygand; Interior, Adrien Marquet; Foreign Affairs, Paul Baudouin; Finance, Yves Bouthillier; Justice, Raphael Alibert; Youth and Family, Jean Ybarnégary; Agriculture, Pierre Caziot; Communications, Deputy François Pietri; Colonies, Sen. Henri Lemery; Public Instruction, Sen. Emile Mireaux. The Marshal also announced that he would appoint governors for the 12 French provinces, giving them a large measure of personal responsibility and authority.

Under the direction of Pétain and his Ministers, the complete reorganization of France along totalitarian lines was gradually carried into effect. The process was by no means completed by the year's end and the promised new constitution was still in the process of formulation, but the main outlines of the new State had been shaped. Municipal elections were provisionally abolished in 2722 towns and cities having more than 2000 inhabitants in order to end municipal politics and electoral strife. Administration of these communities by technical experts along the lines of the American city manager system was planned. On December 15 Marshal Pétain announced his intention of creating a Consultative Assembly. A decree of December 25 made the prefects the supreme authorities in the departments, subordinate to the provincial governors but with authority over all local officials. There was a sweeping reorganization of the personnel of the prefects, judiciary, police, and virtually all other governmental services. The new Supreme Court, created to fix war responsibilities, and the Summary Court, to curb subversion, commenced operations.

**Church and Educational Reforms.** Secret societies were abolished, their headquarters closed and their properties confiscated in a move aimed chiefly at Freemasonry. All government officials were required to take an oath barring membership in secret societies. Jews were barred from directing positions in the government and from some professions. The influence and some former privileges of the Roman Catholic Church were restored. Public church processions, banned for many years, were resumed in August on Assumption Day. In September the Cabinet abrogated the law of 1904 forbidding religious orders to teach in France, and the law of 1901 discriminating against religious associations.

The educational system was reorganized both as

to personnel and methods. Liberal and radical influences were eliminated and inculcation of the love of family, home, and country was made a major objective. Physical education and sports were emphasized, Latin was made compulsory in lower grades, and normal colleges for training teachers of primary schools were abolished. A youth program was initiated "to prepare youth morally and physically to meet the painful exigencies of existence." To replace the former conscript system, abolished by the armistice, all youths in their twenties were required to enroll for six months in a compulsory National Service organization, modeled on the German labor camps. All private youth organizations were placed under government supervision. In an effort to strengthen and encourage the family, various State subsidies were given parents of large families. Divorce was made more difficult. The education of girls was revised to stress preparation for family life, and moral and legal barriers were erected against women in the professions and in industry.

**Censorship Measures.** A partial prohibition law, banning strong drinks in the afternoon, was introduced. State supervision was established over the medical profession, the motion pictures, the press, and other forms of communication and propaganda. Foreigners were barred from French journalism and advertising, and publicity as well as news and editorials were strictly censored. On November 3 the government took over the Havas news agency. At the same time severe penalties were established for listening to foreign radio stations broadcasting "anti-national" propaganda and for the publication of slurs or attacks upon the Chief of State. A government Office of Information was established December 20 to centralize and control the distribution of all news in France.

**Economic Reorganization.** The dictatorship also undertook the reorganization of the economic system along corporative lines. Labor unions, employers' associations, and trusts were dissolved. The regime of economic liberalism was abolished. New federations of workers, employers, and professional men were established under strict government control and supervision. Each industry was placed under a standard organization attached to a cabinet Ministry and a permit system made membership in the organization and observance of its rules and regulations a virtual necessity. State control over production, marketing, and consumption of industrial goods was established September 12. The French Line was reorganized under government control on December 15. The rebuilding and electrification of the railway system was undertaken.

The franc was detached from the pound sterling and placed on a managed currency basis. The task of framing the 1941 budget was placed in the hands of a committee of 13 members appointed by Marshal Pétain. Standard prices were imposed for stable foods and other necessities and this, together with rationing regulations and the control of production and distribution, maintained prices on a fairly stable level. Foreign commerce was severely regulated and conducted mainly on a barter basis.

Particular care was taken in reorganizing agriculture on a corporative basis. Local syndicates of peasant families were grouped into regional unions functioning through regional councils, charged with supervision of insurance, health, etc. Delegations from the regional unions were to form a national council, charged with supervision over the

regional units. In addition the national council was to control special groups of peasants, organized by categories of production, to promote agricultural progress. A back-to-the-land movement was initiated, with the direct assistance and under the organized control of the government. The State assumed power to give landless farmers nine-year concessions to land that had been idle for more than two years. It undertook the organization of "farm crews" to aid in the seasonal activities of sowing and harvesting. Some hundreds of thousands of demobilized soldiers and unemployed workers were mobilized to aid in the reconstruction of war damage and other State activities.

**The New Army, etc.** The army was demobilized in accordance with the armistice terms and then reorganized on a volunteer basis. Large numbers of officers were retired. The new army law of October 9 provided for terms of service varying from three to 15 years, according to the branch of service. Recruiting of a "quality force" of men between 18 and 25 was begun in November. The liberties and privileges accorded foreigners in republican France were withdrawn and many of anti-Nazi refugees from Germany and German-occupied territories were turned over to the Gestapo under the terms of the armistice. Increasingly harsh measures were taken to curb underground activities of the Communists, who had played a prominent part in the demoralization and defeat of France. On October 25, 1000 "Communist militants and propagandists" were arrested in the Paris area and elsewhere and a number of arms caches were raided.

Meanwhile the government gradually brought order out of the chaos that resulted from the French military collapse. Most of the 10,000,000 refugees, who had fled into Southern France before the advancing Germans, were repatriated. (Over 3,000,000 persons had left the Paris area alone.) The number of unemployed was reduced to about 800,000 by the year end. Some 2,000,000 demobilized soldiers were returned to their homes.

**The Food Problem.** The food shortage became increasingly acute, notwithstanding the progressive tightening of the rationing system introduced on October 1. In August an American Red Cross official reported that the "situation throughout France now is worse than in Belgium after the World War and is growing still worse." The Germans shipped large quantities of foodstuffs from France to the Reich and in addition the army of occupation requisitioned much French produce. The disruption of the French transportation and distribution system also made it difficult to distribute existing food supplies. However some food shipments were received from the French North African colonies and a small quantity of American relief supplies were allowed through the British blockade, which cut France off from most of the outside sources of supply. As a result, actual famine was averted during 1940 although the shortage of food, fuel, and clothing caused widespread hardship.

**Purge of Opposition Leaders.** While laying the foundations for a Fascist France, the Pétain Government undertook a "moral purge" of the opposition leaders. The Supreme Court of Justice, created under the Constitutional Act of July 30, convened at Riom on August 8. After a secret investigation into the alleged "crimes and misdemeanors" of governmental officials held responsible for France's involvement and defeat in war and

others charged with attempts against the security of the State, indictments were returned on September 5 against former Air Ministers Guy La Chambre and Pierre Cot, both of whom were then in the United States.

On September 7, ex-Premiers Daladier and Reynaud and General Gamelin were taken into "administrative internment" under Daladier's decree of Sept. 3, 1939, providing for the internment of persons regarded as dangerous to public security and the national defense. Former Minister of Interior Mandel was brought from Morocco and confined under the same law on September 11. On September 15 ex-Premier Léon Blum was confined with the four other notables in the Chateau de Chazeron near Vichy. Subsequently many other leaders of the Popular Front and of the Daladier and Reynaud Governments were interned.

The public prosecutor assigned to the Riom court asked the indictment of Daladier and Gamelin on September 18. Daladier was accused of declaring war without consulting Parliament and of failing to equip the army properly while serving as Minister of War. General Gamelin was charged with blundering in his conduct of French military operations. On October 19, the prosecutor asked the indictment of Blum for "betrayal of the duties of his charge" as Premier in the first Popular Front Government; of Mandel for "corruption and speculation on the value of the national currency;" and of Reynaud for "embezzlement of public funds."

On November 17 Gamelin, Daladier, and Blum were formally arrested and transferred from the Chateau de Chazeron to the detention center at Bourrasol near Riom. A few days later Reynaud and Mandel were moved to Pellevoisin, where a dozen lesser political figures and airplane manufacturers were being detained. At the end of December, preparations were still being made at Riom for the formal trial of the indicted men.

Vichy officials stated that the purpose of these trials was to apportion responsibility for France's entrance into the war and subsequent defeat. General de Gaulle, in London, charged that "the wretched people who betrayed France by capitulating are trying to divert attention from their own crimes." Neutral observers in France reported that the Riom trials had two major objectives—to discredit the defunct Republic and its still influential leaders, and to prove to the Germans that a few politicians and not the French nation as a whole were responsible for France's participation in the conflict. It was hoped in this way to temper the harshness of the terms that the Germans were believed likely to impose in the final peace settlement.

Meanwhile punishment was meted out to many prominent Leftist politicians, journalists, bankers, and others—many of them Jews—who had taken refuge abroad and continued to oppose the Pétain Government and its program of collaboration with Germany. The Vichy Government during October revoked the citizenship and confiscated the properties of 34 leading exiles. A military tribunal at Clermont-Ferrand tried others on military charges arising from their support of General de Gaulle's "Free French" movement or from the ill-fated effort of Daladier and his associates to continue the war from North Africa. Jean Zay, who resigned his post as Minister of Education to join the army when war was declared, and Pierre Viot, Under-Secretary of State for Foreign

Affairs in the Blum Government, were convicted of desertion for going to Morocco on the *Massilia*. Two former aides of Premier Reynaud were convicted in absentia of desertion and removing war documents. Some de Gaulle officers arrested for rebellious activity at Dakar, Senegal, were awaiting a hearing at the year's end on treason charges before the Summary Court established to try speculators and traitors.

**France and Germany.** Marshal Pétain's capitulation to Germany and his program for the reorganization and reconstruction of France was predicated largely upon his conviction that a German victory over Britain was inevitable and that France must come to terms with the new master of Europe. Hitler likewise anticipated the early collapse of British resistance. The terms of the armistice imposed upon France were based on that assumption. When the British fought off the German air invasion during August and September and later launched successful offensives against the Italians in Africa and the Mediterranean, the Vichy and Berlin Governments were both forced to revise their policies.

British tenacity strengthened Pétain's hand in resisting German demands, while at the same time it undermined the prestige of his government among Frenchmen and made his policy of limited collaboration with the Reich more and more dangerous to the unity of the nation and of the empire. Support for General de Gaulle's "Free French" movement gained momentum with each British and Greek victory, making it increasingly difficult for Vichy to hold the French colonies in line. Simultaneously Hitler's anxiety to win French collaboration against Britain increased, and the Germans resorted increasingly to a combination of threats and promises to secure the Vichy Government's co-operation.

**Loss of Alsace and Lorraine.** Beginning late in July the Germanization of Alsace and Lorraine commenced under German civil administrators appointed by Chancellor Hitler. National Socialism was introduced a step at a time, while all elements of French culture were rooted out through repressive legislation, the deportation of French-speaking inhabitants, the closing of French schools, etc. Toward the end of the year, it was formally announced that Alsace and Lorraine were being re-incorporated in the Reich.

**Conditions in Occupied Area.** In the remainder of the occupied area of France, German measures became progressively more onerous while the long-drawn-out negotiations with Vichy proceeded. Anti-German and pro-British individuals were imprisoned or removed from their positions. On June 27 severe penalties were imposed for the possession of arms or radio-sending apparatus, for listening to non-German radio broadcasts, spreading anti-German reports, holding meetings or demonstrations, and for either the dismissal of employees or the quitting of work by employees in order to harm German interests.

Factories in the occupied area were put to work on German war orders wherever possible. The machinery of others was shipped to Germany. On July 28 a ban was imposed on traffic and communication between the occupied and unoccupied areas, while a mounting barrage of criticism was aimed at the Vichy Government by official German spokesmen and by the press, which had been placed under rigid German control. French producers and storekeepers were forced to exchange their goods

for paper marks, printed especially for the army of occupation and not exchangeable outside of the occupied area. On August 10 all banks and other financial institutions in the occupied zone were placed under German supervision.

The efforts of the Vichy Government to return to Paris in accordance with the armistice terms were repeatedly rebuffed. Marshal Pétain, in a broadcast on August 13, announced that the German Government informed him on August 7 that it could not permit the transfer to Paris "for reasons of a technical nature and so long as certain material conditions had not been realized." From various sources it was indicated that the Germans wanted the co-operation of the Vichy Government in obtaining the French gold reserves in the United States. They demanded the elimination of suspected anti-German individuals from the Vichy Cabinet and the restriction of French authority in the unoccupied area. Foreign Minister Baudouin was denounced for his alleged efforts to form an Italo-French-Spanish bloc as a counter-weight to Germany.

**Pétain Reorganizes Cabinet.** The Vichy Government made efforts to conciliate the Germans and relieve this mounting pressure. Vichy suspended relations with the refugee Dutch and Belgian governments, interned all British subjects, and reorganized the personnel of the Foreign Service to eliminate persons unacceptable to Berlin. Moreover all of the former parliamentarians in the Pétain Government except Vice Premier Laval were eliminated in a cabinet reorganization on September 6. Laval, who had conducted negotiations with the German Ambassador in Paris, obtained greatly increased powers. He secured control of all means of propaganda and communication along with the duty of co-ordinating the work of the various governmental departments.

Important changes in the cabinet included the replacement of the influential Adrien Marquet as Minister of Interior by Marcel Peyrouton and of War Minister Maxime Weygand by Gen. Charles Huntziger. Weygand was sent to French North Africa as general delegate, armed with full civil and military powers, including command of all France's armed forces in North and West Africa and Syria. The purpose of his mission was not only to keep the colonies loyal to the Vichy Government but also to back up Marshal Pétain in his negotiations with the Germans. The other members of the cabinet were either military-naval men or experienced civil servants sympathetic to Pétain's program of national reconstruction.

The foregoing measures failed to appease the Germans, who were becoming more insistent upon control of unoccupied France and the use of French air and naval bases in North Africa, West Africa and Syria. On September 14 travel and communication between the occupied and unoccupied zones were further restricted. Deportations from Alsace-Lorraine and other parts of the occupied zone were increased and the whole machinery of German control was tightened. Hundreds of thousands of French war prisoners were sent to Germany to augment the labor force.

In a message to the French people on October 10, Marshal Pétain appealed to Hitler to make "a wholly new peace of collaboration" rather than "the traditional peace of oppression." He said that France would collaborate with the Reich on an honorable basis but that "if all roads are closed to us, we shall know how to suffer and wait."

**Hitler and Pétain Confer.** This statement was followed by a new effort to arrive at a settlement with the Germans that would ease the tragic position of French war prisoners and the whole civil population. Vice Premier Laval was entrusted with the negotiations. On October 21 Pétain announced through the French press that his government had decided to change its foreign policy. On the following day Laval conferred with Hitler in Paris. He reported to the cabinet at Vichy and was returning to Paris for further discussion with the German Fuehrer when Marshal Pétain decided to intervene directly. Laval was recalled to Vichy and a communiqué was issued stating that under no circumstances would France fight against Britain or turn over her fleet or armaments for war purposes. It was indicated that Laval had agreed to such conditions in his talks with Hitler and that Pétain had repudiated Laval's stand.

There followed on October 24 a historic meeting between Hitler and Marshal Pétain near Tours in occupied France. Two days later the Marshal informed his cabinet that after discussing means of "reconstructing peace in Europe" they had "come to agreement on the principle of collaboration. Methods of application are yet to be examined." The cabinet approved this decision and on October 28 Vice Premier Laval replaced Paul Baudouin as Foreign Minister to carry on the negotiations with the Germans for application of the accord. However Pétain sent War Minister Huntziger to Paris with Laval to participate in the negotiations. In a radio broadcast to the nation on October 30, which hinted at dissensions within his government, the Marshal called upon the nation and the colonial empire to follow his leadership. He said he had accepted only the principle of collaboration with Germany and that such collaboration "might" lighten France's burden by improving the status of the war prisoners, reducing the cost of the German occupation, and relaxing the barrier between occupied and unoccupied France.

**The Pétain-Laval Split.** The conflict between Pétain and Laval over the extent of French co-operation with Germany rapidly widened in subsequent weeks. Before conferring with Hitler on October 22, Laval had asserted in a press interview in Paris that he was staking the future of France on collaboration with the Reich, that he was convinced democracy was doomed everywhere, and that he hoped for the complete destruction of the British. He apparently was determined to turn over French metropolitan and colonial bases to the Axis, to cede part of the French fleet, and even to join openly in the war upon Britain. Pétain firmly rejected these proposals, which threatened to throw the French colonial empire into the arms of General de Gaulle and the British and to provoke civil conflict within France. There were serious anti-German demonstrations in Paris on Armistice Day (November 11).

With the support of the Germans, Laval strengthened his position at Vichy in preparation for an attempt to oust Marshal Pétain and swing France over to a policy of full co-operation with the Reich under his leadership. Meanwhile the German occupational authorities continued to tighten the screws on Pétain and the French people generally to force acceptance of Laval's policies. The tightening of German controls was varied with occasional minor concessions to aid Laval in his struggle with Pétain. Among such gestures was Hitler's announcement, on the centenary of the return of

Napoleon's ashes from St. Helena to Paris; that the remains of Napoleon's only son, the Duke of Reichstadt, would be returned from Vienna to Paris. Marshal Pétain was invited to attend the ceremonies in connection with the reinterment in the Invalides (Napoleon's tomb) on December 15.

Laval apparently conspired to take the Marshal into custody in Paris and seize control at Vichy. The plot was said to have been discovered by Minister of Interior Peyrouton, who denounced Laval to Pétain. The Marshal confronted Laval at a cabinet meeting in Vichy on December 14 and ordered him placed under arrest. In a radio address to the nation that evening he announced the dismissal of Laval from the cabinet and the revocation of Constitutional Act No. 4, designating Laval as his successor. Announcing that Pierre-Etienne Flandin had been appointed Foreign Minister, the Marshal declared that he had taken action against Laval "for high reasons of interior policy . . . in no way connected with our relations with Germany."

**Pressure on Pétain.** The detention of Laval and the eradication of his influence at Vichy was a severe setback to German plans in France. The Nazi press and official statements from Berlin adopted a more threatening tone toward the Pétain Government. On December 16 Otto Abetz, German Ambassador in Paris, arrived at Vichy with a guard of picked German troops and demanded the "moral rehabilitation" of Laval. He obtained Laval release, and after an interview with Pétain the former Vice Premier took up residence in Paris. Laval's friend, Fernand de Brinon, was named chief liaison officer between Vichy and Paris and the palace guard organized by Minister of Interior Peyrouton was dissolved. But the Marshal up to the end of the year stubbornly resisted German demands that Laval be readmitted into the cabinet.

On Christmas Eve Pétain sent Adm. Jean Darlan to Paris to resume negotiations for limited collaboration with Germany. No progress was achieved up to the end of the year, however. The cost of the German army of occupation amounted in September to 400,000,000 francs a day or half the cost of prosecuting the war. On December 22 the total provisional non-interest-bearing advances from the Bank of France to the State to defray the cost of supporting German troops were increased to 73,000,000,000 francs. No progress whatever was made toward liberating the war prisoners in Germany and occupied France. The food situation throughout France was becoming increasingly acute. How long the Vichy Government could resist Hitler's demands under these circumstances remained problematical. But all signs pointed to a stiffening of French morale and a revival of hope for liberation as Axis difficulties multiplied.

**"Free French" Activities.** Throughout the critical months following Pétain's capitulation, General de Gaulle's "Free French" forces slowly gained strength and prestige as the prospects for successful Allied prosecution of the war brightened and as German mastery in France became more onerous. On August 7, the British Government undertook to bear the cost of de Gaulle's armed forces in so far as necessary, and to permit them to retain their French character and leadership under nominal British control. At the same time Prime Minister Churchill pledged the "full restoration of the independence and greatness of France" when an Allied victory was gained.

This enabled de Gaulle and the French officers who rallied to his cause to reorganize the military, naval, and air units that had escaped to Britain during the debacle in France. Those desiring to return to France were repatriated, but their places were taken by Frenchmen who escaped from France or the Vichy-controlled French colonies or who volunteered from British Empire and neutral countries. One "Free French" military force was organized in Britain, with a nucleus of veterans of the Narvik campaign and of troops evacuated from Dunkirk. Many French pilots flew their planes across the Channel from unoccupied France, while others stationed in French North Africa flew to Gibraltar or Egypt to join the British and "Free French." Large units of the French forces in Syria crossed into Palestine rather than accept the armistice terms and in December participated in the British offensive in North Africa. On November 29 de Gaulle claimed that his forces comprised 35,000 trained troops, 20 warships, 1000 aviators, and 60 merchant ships.

Beginning in August some of the lesser French colonies ousted their pro-Vichy officials and threw in their lot with General de Gaulle, while similar movements in other colonies were repressed with difficulty. The New Hebrides and New Caledonia in the Pacific, French Cameroon and most of French Equatorial Africa repudiated the Vichy Government in August and smaller colonies in French India and the Pacific followed suit. On September 23 "Free French" forces under the personal direction of General de Gaulle, supported by a British naval squadron, attempted to capture the strategically important port and capital of French West Africa at Dakar. The attack, which was designed to bring all of French West Africa under "Free French" control and encourage the movement in French North Africa, was beaten off.

This fiasco delayed the progress of the de Gaulle movement temporarily. But on October 10 his forces landed at Duala, capital of French Cameroon, and shortly afterward began a military campaign that brought the rest of French Equatorial Africa under "Free French" control early in November. Meanwhile on October 27 General de Gaulle issued a proclamation from Leopoldville, in the Belgian Congo, declaring that "since the French Government and the representation of the French people do not exist normally and independently of the enemy, the powers formally performed by the Chief of State and by the Council of Ministers will be exercised by the leader of the Free French forces assisted by a Council of Defense."

While consolidating his position in Equatorial Africa and preparing to aid the British in Egypt and East Africa, General de Gaulle returned to London and in a series of radio broadcasts attacked the Vichy Government for its anti-Jewish measures and other anti-democratic legislation and aims. He appealed for resistance to German pressure and for the aid of the colonial military forces under Vichy's control in driving the Italians out of Africa.

Supported by General Weygand in French North Africa, the Pétain Government sought to counter de Gaulle's efforts by rounding up his adherents, curbing their propaganda, replacing doubtful officials in the colonies with pro-Vichy appointees, and revoking the limited powers of self-government exercised by some of the colonial assemblies. On November 25 Jean Chiappe, former prefect of the Paris police and a well-known Rightist, was

Oran on July 3 was followed by French air attacks upon Gibraltar and on July 8 by Vichy's severance of diplomatic relations with London. Their respective embassies were closed on July 17, but it was agreed to exchange agents to liquidate the important economic matters still outstanding between the two former allies.

During July Vichy directed a series of angry protests to London against the Oran affair, the requisitioning of French merchantmen in British ports, the bombing by the R.A.F. of German-held bases in France, the distribution of propaganda leaflets by British aircraft over French territories, etc. The revolt of the French colonies was also attributed to British influence. While enforcing the blockade against Vichy-controlled colonies, the British purchased the surplus products of the colonies under "Free French" control and extended other economic support. The joint "Free French" and British attack on Dakar brought another retaliatory bombing of Gibraltar by French planes based in Morocco.

When the negotiations between Laval, Hitler, and Pétain appeared to be nearing a conclusion, Prime Minister Churchill on October 22 broadcast a radio appeal to the French people to continue the fight against the Germans and not to hinder Britain in the prosecution of the war. On October 23 the British agreed to permit medical supplies to enter occupied and unoccupied France through the blockade. About the same time King George VI sent a message to Marshal Pétain expressing sympathy for French sufferings and assuring him that France would share in Britain's ultimate victory. The Marshal was reported to have replied by curtly pointing out the unfortunate effect of British attacks on Frenchmen at Oran and Dakar. A minor air attack on Marseille, attributed to a British airplane, brought another French protest on November 25. In December it was revealed that French warships were convoying foodships between Marseille and French North Africa without British interference.

**Influence of United States.** In their efforts to prevent the Vichy Government from collaborating with Germany, the British and "Free French" received influential support from Washington. French assets in the United States valued at more than a billion dollars were "frozen" by order of President Roosevelt on June 17 to prevent their acquisition by the Germans. A large stock of French gold was transferred from France to the United States on a U.S. cruiser during the same month. American authorities delayed giving the Vichy Government access to any of these funds until they received assurances that French collaboration with Germany would not go to the extent of impairing American interests.

An announcement at Vichy on September 30 that the defenses of the island of Martinique in the West Indies would be strengthened was frowned upon in Washington, and the State Department made futile efforts to regain about 100 American airplanes that had been taken to Fort de France, Martinique, by the French aircraft carrier *Bearn*. The disposition of some \$200,000,000 worth of gold held by the French Government at Fort de France was also at issue. On the day Marshal Pétain conferred with Hitler, President Roosevelt sent him a personal message warning that close military collaboration with Germany would lead the United States to invoke the Declaration of Havana and to occupy the French West Indian possessions.

Pétain replied that France did not intend to go to war against Britain, surrender her fleet to Germany, or permit Axis use of additional French bases.

Through American mediation, an agreement for partial demilitarization of Martinique and the cessation of the British naval blockade was concluded (see MARTINIQUE under *History*). On November 22 President Roosevelt appointed Rear Admiral W. D. Leahy as Ambassador to France. He arrived in Vichy at the beginning of January, 1941.

**France and Italy.** Mussolini's entry into the European War on June 10, when German victory over France seemed assured, marked the final failure of repeated French efforts to conciliate Italy and obtain either her active aid against the Reich or her neutrality without granting the extensive territorial and other concessions demanded by Rome (see YEAR BOOKS for 1935 to 1939). These efforts were pursued by the Daladier and Reynaud Governments during the first part of 1940. Negotiations for a revised Franco-Italian trade pact were begun in Paris February 26, but were never completed. After the Brennero meeting between Hitler and Mussolini on March 18 the Italian press assumed a more threatening tone toward France and Britain. During the campaign in Norway beginning April 9, Fascist threats to enter the war caused the Allies to shift additional naval forces to the Mediterranean and contributed materially to the German triumph.

Nevertheless Premier Reynaud on April 20 again proclaimed France's desire for a settlement of questions at issue with Italy. Adopting Pierre Laval's policy, he declared that his government considered a Mediterranean entente with Italy and Spain to be one of the indispensable bases of peace. This overture met with no response, other than Italian protests at the alleged damage caused Italian industry by the Anglo-French blockade. On June 6, the second day of the Battle of France, Premier Reynaud made a final effort to prevent Italian participation. He called upon Italy to settle peacefully her disputes with France in order "to avoid the hegemony of Germany." But on June 10 the French Ambassador at Rome was informed that Italy was entering the conflict in "fulfillment of her Axis obligations."

On June 20 the Pétain Government asked Italy for an armistice. The Italians carefully avoided drama and humiliating conduct in their negotiations with the French armistice delegation commencing June 23. But their terms were considered severe and were accepted by the French only after extended debate.

For France's relations with other powers during 1940, see BELGIUM, CANADA, CHINA, FINLAND, FRENCH INDO-CHINA, GREECE, IRAQ, ITALY, JAPAN, MEXICO, NORWAY, PANAMA, RUMANIA, SPAIN, SWITZERLAND, SYRIA AND LEBANON, TANGIER, TURKEY, UNION OF SOVIET SOCIALIST REPUBLICS, under *History*. **FRANKLIN INSTITUTE.** The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, founded in 1824, is devoted to the increase of useful knowledge, to the encouragement of invention and discovery, and to the education of the public in the achievements of science and industry. Its very title has always

indicated a desire to do honor to Benjamin Franklin.

The Committee on Science and Arts, formed of 66 members of the Institute, reviews in great detail many of the advances of science and technology. It recommends to the Board of Managers those persons deserving the annual awards of the Institute, which are formally presented at Medal Day Exercises in May. A Franklin Medal, highest award of the Institute, was presented in 1940 to Dr. Leo Hendrik Baekeland, retired president of the Bakelite Corporation, and to Dr. Arthur H. Compton of the University of Chicago for his "brilliant experiments on various properties of X-rays." The Cresson Gold Medal was awarded to Dr. Robert R. Williams, chemical director of the Bell Telephone Laboratories, for his researches on vitamin B1.

The Franklin Institute includes in its activity publication of *The Journal of the Franklin Institute*, established in January, 1826, lectures presented about 20 times a year by distinguished persons in science and industry, and traveling shows which extend its educational influence beyond its walls. From the laboratories of the Bartol Research Foundation and the Biochemical Research Foundation, additions are constantly being made to scientific knowledge. The Institute also operates a seismograph and promotes scientific expeditions. The seismograph and observatory, with Franklin Hall and the Fels Planetarium, together with its 4000 active exhibits constitute the Institute's museum. The library now numbers 121,000 volumes and 40,000 pamphlets, devoted entirely to works on applied science and technology, and is particularly noted for the collection of patent literature.

The President in 1940 was Philip C. Staples; Secretary and Director, Henry Butler Allen. The Institute is located in a new building on Benjamin Franklin Parkway, Philadelphia, Pa.

**FREEMASONRY.** Dedication of the new Scottish Rite Temple in Washington, D.C., occurred on May 12 with elaborate ceremonies. The Order of De Molay for boys (under Masonic auspices) is raising \$40,000 for the erection of a statue of George Washington at the entrance of the Memorial Temple at Alexandria, Va. Under a special dispensation from the Alberta (Can.) Grand Lodge, Ivanhoe Lodge No. 142 at Edmonton, dedicated a 445-lb. granite pillar, to mark the site of the first Masonic lodge meeting in Canada within the Arctic Circle.

**Civic Activities.** The Connecticut Grand Lodge now requires each applicant for the degrees to submit duplicate fingerprint cards, one set for filing with the Department of Justice in Washington. According to the Masonic Relief Association, \$4,670,043 were spent for charity during the fiscal year ending in 1940 by the 49 American Grand Lodges, of which 28 maintain each a Masonic Home for aged and indigent Masons and 7 more maintain two such Homes. Hospitals in connection with the Homes are supported in 17 jurisdictions. The Missouri Grand Lodge, which maintains two Homes, offers the use thereof, together with transportation and education, to 25 European refugee children now, and possibly 15 more later.

"Masonry sees in the coming generations the future promises of our country," said Grand Commander Lopez-Penha of the Dominican Supreme Council in presenting a silver trophy to the winning basketball team of Ciudad Trujillo Normal High School; for some years the Council has do-

nated copy books to the schools. Despite the war, a total of £297,881 was raised by the stewards of English lodges for the three Royal Masonic Institutions maintained by the premier Grand Lodge.

**France.** On August 3 the Pétain government at Vichy, formally decreed the dissolution of all secret societies, including, of course, the Masonic Order.

**Ireland.** "Freemasonry is not banned by the Government," writes J. Edward Allen; "quite the contrary; but lawless bands of Irish from time to time storm and occupy the Masonic Temples . . . When Masons protest they are told that it is possible to stop the lawlessness . . . but that it is strongly advised not to."

**Japan.** The Masonic bodies, whose membership is required to be limited to foreigners, are facing complete suppression, following the dissolution of Rotary Clubs.

**Netherlands.** Masonry has been suppressed by the Nazi military government.

**Norway.** Under date of September 21 it was announced that the Masonic Lodges "had been dissolved," and on November 29, Quisling, the Nazi Fuehrer, issued a decree penalizing continued membership and converting the order's headquarters into a museum.

**Spain.** On March 2, Dictator Franco issued a retroactive decree dissolving "Masonic, communistic, and other secret orders;" but the decree was primarily directed against the first, confiscating property and imposing penalties of six years imprisonment for membership or support.

**Yugoslavia.** As the result of a crusade sponsored by the clerical Minister of Education, Koroshetz, the Grand Lodge, it was announced on August 2, "decided" to dissolve and discontinue its activities.

The Mother Scottish Rite Supreme Council announced in October that no communications had been received from Masonic bodies in Finland, Denmark, or Belgium since their invasion by the totalitarian powers. The most recent estimate of Masons in Europe is 63,050.

**Conventions, etc. (National and International):**

**February 23, 24,** National Conference of Grand Masters at Washington; 8 subjects were on the agenda and a committee was appointed to report on "continuity of administration" at the 1941 conference.

**April 6,** centenary celebration of Illinois Grand Lodge, Jacksonville.

**April 24,** Annual Festival of Grand Lodge of England, Duke of Kent, Grand Master, presiding, Earl of Harewood reappointed pro-Grand Master, 5056 subordinate lodges reported with an estimated membership of 450,000. (Masons in the British Empire, 1,048,426.)

**June 3,** centenary of first Masonic convocation in Missouri, celebrated at Lexington by Lodge No. 149.

**June 11-13,** annual meeting, Imperial Council, Nobles of the Mystic Shrine at Memphis, Tenn. George F. Olen-dorf of Springfield, Mo., was elected Imperial Potentate. Iowa Grand Lodge observed centennial of Iowa Masonry at Burlington; 1500 Masons attended.

**July 15-19,** 41st triennial convocation of Grand Encampment of Knights Templar, at Cleveland.

**September 22,** annual meeting of Northern Supreme Council at Cincinnati.

**October 1,** annual session, Canadian Supreme Council at Montreal; total membership of the 1379 Canadian subordinate lodges is reported as 168,951.

**October 8,** centennial celebration of Louisville Commandery and the beginnings of Knight Templary in Kentucky.

Total membership of the 50 (including Philippine) Grand Lodges of the United States is reported as 2,489,587; estimated grand total of the world, 3,798,451. See *BULGARIA under History*.

**FRENCH ACADEMY.** ACADEMY, FRENCH.  
**FRENCH CAMEROON.** See CAMEROON,  
 FRENCH.

**FRENCH CONGO.** See FRENCH EQUATORIAL  
 AFRICA.

**FRENCH EQUATORIAL AFRICA.** A French colonial territory consisting of the four colonies: Chad (461,202 sq. mi.; capital, Fort Lamy), Gabon (93,218 sq. mi.; capital, Libreville), Middle Congo (166,069 sq. mi.; capital, Brazzaville), and Ubangi-Shari (238,767 sq. mi.; capital, Bangui). Total area, 959,256 square miles; total population (Jan. 1, 1938 estimate), 3,500,000. Capital, Brazzaville. The chief products are palm oil, coffee, cacao, cotton, and wild rubber. Tropical forests of 300,000 miles in area contain trees of industrial value. Ivory is an important item of export. The minerals found include copper, zinc, and lead. A railway, 318 miles in length, connects Pointe-Noire with Brazzaville. Trade, values in old United States gold dollars (1938): Imports, \$5,000,000; exports, \$5,200,000. Budget (1938): Revenue and expenditure balanced at 224,629,000 francs (franc averaged \$0.0288 for 1938; \$0.0251 for 1939). French Equatorial Africa is a single administrative unit under the rule of a governor general, aided by an administrative council.

**History.** French Equatorial Africa was the most important French colony to declare its independence of the Vichy Government during 1940 and throw in its lot with Gen. Charles de Gaulle's "Free French" forces. The secession movement began in the Chad Colony on August 28 and spread immediately afterward to French Cameroon (q.v.) and to Brazzaville, capital of Equatorial Africa, in the Middle Congo district. The pro-Vichy Governor General at Brazzaville was replaced by General de Gaulle's representative, General de Larminat. Officials of the Gabon district remained loyal to the Vichy regime until the second week of November when Lambarene, Libreville, and Port Gentil were captured by "Free French" forces in a short campaign.

See CONGO, BELGIAN and FRANCE under *History*; EUROPEAN WAR under *Effects of the Fall of France*.

**FRENCH GUIANA.** A French colony in South America. Area, 7722 square miles; population (1936 census), 30,906. The penal settlement had a population of 5628 men. Capital, Cayenne, 11,704 inhabitants. Rice, maize, manioc, cacao, coffee, bananas, and sugar cane are the chief agricultural crops. There are large forests rich in various kinds of timber. Gold mining is the most important industry. Trade (1937): Imports, 52,708,646 francs; exports, 36,853,999 francs (franc averaged \$0.0405 for 1937). Budget (1937): Balanced at 17,704,755 francs. The colony is administered by a governor, assisted by a privy council and a general council.

**ININI, TERRITORY OF.** This territory comprises the hinterland separated from French Guiana by the Decree of July 6, 1930. Area, 27,027 square miles; population (1936), 6099. The main center is Maroni. Rose wood and cabinet wood are the chief products. Figures of commerce are included in those of French Guiana. Budget (1937): Balanced at 3,329,542 francs. The territory is under the direct administration of the governor of French Guiana, assisted by an administrative council.

**History.** Although strong sentiment in favor of Gen. Charles de Gaulle's "Free French" movement was reported from French Guiana after the

defeat of France, Gov. Robert Chot and his administration remained loyal to the Vichy Government throughout the remainder of the year. On October 11 a de Gaulle spokesman in London charged the Vichy Government with attempting to introduce a German mission into French Guiana, but this was denied by Vichy officials. To keep in touch with developments in the colony, the State Department in Washington on August 17 announced the opening of a consulate at Cayenne.

See FRANCE under *History*.

**FRENCH GUINEA.** See FRENCH WEST AFRICA.

**FRENCH INDIA.** The five French colonies in India—Chandernagor, Karikal, Mahé, Pondichéry, and Yanam. Area, 196 square miles; population (1938), 300,353. Capital, Pondichéry (50,209 inhabitants). Chief products: Rice, groundnuts, and manioc. In 1938 (at the ports of Pondichéry and Karikal), imports amounted to 79,053,000 francs and exports to 118,446,000 francs (franc averaged \$0.0288 for 1938). All five colonies adhered to the "Free French" movement headed by Gen. Charles de Gaulle following the French capitulation to Germany and Italy in June, 1940. See FRANCE under *History*.

**FRENCH INDO-CHINA.** A French dependency in southeastern Asia comprising the divisions shown in the accompanying table.

<i>Division</i>	<i>Sq. mi.</i>	<i>Pop (1936)</i>	<i>Capital</i>
Annam * . . . . .	57,143	5,656,000	Huê
Cambodia * . . . . .	69,884	3,046,000	Pnom-Penh
Cochin China * . . . . .	25,096	4,616,000	Saigon
Kwangchowan * . . . . .	309	230,000	Fort Bayard
Laos * . . . . .	89,189	1,012,000	Vientiane
Tonkin (Tongking) * . . . . .	44,787	8,700,000	Hanoi
French Indo-China . . . . .	286,408	23,260,000	Hanoi *

\* Protectorate. \* Colony. \* Also known as Kwangchow. Leased from China for 99 years in 1898 (territory increased in 1899) and placed under the authority of the Governor-General of French Indo-China. \* The capital city is Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon.

Chief towns: Hanoi, the capital, 145,491 inhabitants; Binh-Dinh, 147,199; Cholon, 145,254; Haiphong, 122,000; Saigon, 111,000; Pnom-Penh, 102,678; Tchékam, 35,000; Huê, 33,222; Vientiane, 28,000; Battambang, 22,000; Fort Bayard, 12,000. Education (1938): 6934 primary, secondary, and professional schools with a total of 488,821 students enrolled; the university at Hanoi had 631 students.

**Production and Trade.** The most important agricultural product is rice, of which 1,692,000 metric tons were exported during 1939. Other agricultural products were rubber (66,000 metric tons in 1939), maize, pepper, spices, tea, kapok, groundnuts, and copra. Mineral production (1939) in metric tons: Coal (2,544,000), tin (1200), zinc (6000), manganese, wolfram, and salt. Trade (1939): imports, 2,382,000,000 francs; exports, 3,492,400,000 francs (franc averaged \$0.0251 for 1939).

**Communications.** In 1938 there were 22,270 miles of highway and 2093 miles of railway (1,170,727 tons of freight and 12,963,804 passengers were carried). Air services were operated on the following routes: Saigon-Batavia (Netherlands Indies), Hanoi-Vientiane, Saigon-Bangkok (Siam). A radio-telephone service is in operation between Saigon and Europe.

**Finance.** The revenue and expenditure of the

1939 general budget balanced at 1,076,381,800 francs. In addition, the supplementary railway budget for 1939 balanced at 156,438,800 francs. The public debt on Jan. 1, 1940, amounted to 2,444,383,000 francs.

**Government.** The government for the whole of French Indo-China is administered by a governor assisted by a secretary-general, a government council, and a grand council for economic affairs. Cochinchina, which is a direct French colony, is headed by a governor aided by a colonial council, and each of the four protectorates is headed by a resident-superior assisted by a protectorate council and a council of economic affairs.

### HISTORY

**The Japanese Invasion.** The defeat of France by German arms in June, 1940, was the signal for Japan to launch its long-planned attempt to seize control of French Indo-China. The groundwork for invasion had been laid by the conquest of Hainan Island and other Chinese territories adjoining Indo-China during 1939 (see YEAR BOOK, 1939, pp. 290, 394). A foothold in French Indo-China was obtained by concessions extracted from France in the weeks previous to the French military debacle in Europe. On June 20 the French Ambassador at Tokyo agreed to cut off most of China's remaining trade through French Indo-China. (Shipments of munitions had been prohibited since early in 1939.) Moreover the French permitted scores of Japanese inspectors, including military and diplomatic officials, to enter French Indo-China and establish trade control stations at five key points on highways and railways leading into China.

While the control stations were being established late in June, Japanese warships appeared at Haiphong and Japanese troops were concentrated in Kwangsi Province on the Chinese side of the French Indo-China border. An immediate military occupation of the French colony appeared imminent until the British attack upon the French fleet at Oran on July 3 and simultaneous pressure exerted from Washington—and possibly from Berlin, also—caused a change in Japan's tactics. The warships were withdrawn from Haiphong on July 4.

Shortly afterward a Japanese military mission headed by General Nishihara arrived at Hanoi and demanded the right to establish naval and air bases, move troops across Indo-Chinese territory to attack the Chinese in Yunnan Province, and control all trade through the ports of Northern and Central Indo-China. The Japanese insisted on cessation of French defense preparations and close co-operation with Japan in economic matters. The Chinese Government at Chungking, on the other hand, warned Hanoi authorities that they would send troops across the frontier if Japanese forces entered French Indo-China. Early in September Chinese forces did attempt to cross the frontier but they were repulsed in a minor clash.

Supported by diplomatic and military moves by the American and British governments, the French authorities in Indo-China resisted Japanese pressure, including an ultimatum from General Nishihara. Early in September, however, the Vichy Government, under pressure from Berlin, ordered Hanoi officials to grant "limited military facilities" to the Japanese. The Nipponese subsequently increased their demands, and it was not until September 22 that an agreement was reached at Hanoi

providing for: (1) Immediate landing of a limited number of Japanese troops at Haiphong, (2) establishment of three Japanese air bases north of the Red River in Tonkin, (3) the garrisoning of these air bases with 6000 Japanese troops, and (4) maintenance of a "few Japanese effectives" at Haiphong.

At 10 o'clock that night an army of more than 10,000 Japanese troops advanced across the Indo-Chinese frontier from Kwangsi Province in China and attacked French forces at three frontier posts. A battle of considerable proportions raged along the frontier until September 25 when the French were obliged to evacuate the important railway center of Langson. Although the agreement signed at Hanoi had not provided for the entry of these troops, the French accepted the *fait accompli*. Fighting ceased and on September 26 the first contingent of Japanese troops authorized by the agreement landed at Haiphong.

Once in control of the new air bases, from which they raided the Burma Road and Chinese cities that were previously beyond the range of their bombing planes, the Japanese demanded further military bases and economic concessions in the southern part of the colony, particularly at Saigon. In November and December large Japanese forces were concentrated in southern China and on Spratly Island (see map in YEAR BOOK, 1939, p. 392) in preparation for the occupation of all of French Indo-China as soon as the world political and military situation permitted. The negotiations for an economic treaty between Japan and French Indo-China were transferred to Tokyo from Hanoi on December 20.

**Hostilities with Thailand.** While attempting to stall the Japanese advance, the French authorities in Hanoi were obliged to face other threats to France's tenuous hold on the colony. The government of Thailand seized the opportunity presented by French impotence to demand the return of sections of Laos and Cambodia, conquered by the Thai people in the 16th century and taken from them by France in 1893. To reinforce Bangkok's demands, Thai warplanes bombed French military posts in the disputed region on September 28. The French Minister at Bangkok then undertook to negotiate a settlement on orders from Vichy. On October 15 it was announced that France had refused to cede territory in Cambodia and Laos west of the Mekong River but had agreed to arbitrate Thai claims to certain islands in the Mekong and to establish a mixed commission to settle frontier incidents.

Notwithstanding the French offer to send a mission to Bangkok to continue negotiations and pressure from Washington for the maintenance of peace and the territorial status quo, the Thai Government concentrated 100,000 troops along the frontier. Beginning in October Thai raids into Indo-China were resisted by French and native troops. An undeclared border war gradually developed, marked by frequent air raids and sporadic clashes between military and naval forces. Hostilities were continuing at the year end, with no definite outcome in sight. The French meanwhile suspended negotiations with Bangkok pending the cessation of Thai attacks. Japan was said to be encouraging Thailand to continue its aggressive policy in order to make Hanoi more amenable to Japanese demands.

**Native Uprisings.** The French authorities also had to contend with serious native uprisings in

Southern French Indo-China toward the end of November. They were variously attributed to nationalist and Communist elements eager to end French rule, to the activities of pro-Thai or pro-Japanese agitators, and to sympathizers with General de Gaulle's "Free French" movement. Not long after riots and demonstrations in seven southern provinces and in the suburbs of Saigon were suppressed, another native revolt occurred in mid-December northwest of Hanoi in the Langson region. French officials asserted that this outbreak was organized and the rebels armed by the Japanese. The movement was reported to have been crushed by French forces without great difficulty.

The anti-French outbreaks were accompanied by some demonstrations of loyalty to the French regime, particularly in the districts demanded by Thailand. King Sisowathmonivong of Cambodia on December 16 pledged his full co-operation with the French in defending the colony. Thai newspapers reported on July 8 that King Bao-Dai of Annam had been assassinated at Hue.

**Disensions Among French.** The Pétain Government's capitulation to Germany and Italy in June divided French officials, military men and civilians in Indo-China into pro-Vichy and pro-de Gaulle factions. Their struggle for control of the colony further weakened it in facing the onslaught of internal and external enemies. Gen. Georges Catroux, whose sympathies were with the "Free French" forces, was recalled as Governor General about June 26 by the Vichy Government and replaced by Vice Admiral Jean Decoux. This move and the subsequent British attack on the French fleet at Oran ended the co-operation between French and British forces in the Far East that might have delayed the Japanese invasion of French Indo-China.

Following an abortive effort of pro-de Gaulle elements late in August to seize control of the colony, Governor General Decoux was reported to have dismissed "Free French" sympathizers from commands and offices throughout Indo-China. On November 20 another group of de Gaulle adherents were arrested in Saigon in connection with a conspiracy to oust the pro-Vichy government. The Vichy regime made further changes in the colony's administrative personnel on December 13, appointing Henri George Rivoal as Governor General and Emile Grandjean as Resident General of Tonkin.

Meanwhile the cost of living rose sharply, adding to native unrest. Foreign and domestic trade was disorganized, and the colony seemed headed for major political and economic difficulties as well as eventual absorption by Japan.

See CHINA, FRANCE, JAPAN, and THAILAND under *History*.

**FRENCH IVORY COAST.** See FRENCH WEST AFRICA.

**FRENCH LITERATURE.** Literary production in France had been brought to an almost complete standstill in September 1939. The relative calm of the first weeks of hostilities, however, brought about a rapid reaction in France as well as in England; people let themselves be lulled into a tragic illusion that things were to continue that way indefinitely, and literary activity again assumed a quick tempo. This tempo was kept up until the very eve of the invasion and the occupation of Paris in June. Meetings were held as if nothing had happened. The French Academy (q.v.) proceeded to the election of a new "secrétaire perpétuel," André Bellessort, and announced the elec-

tion of Paul Hazard to the "fauteuil" of Georges Goyau; on January 18th, Jérôme Tharaud's belated reception took place with the usual ceremonies; as late as May the annual "séance de distribution des Prix de vertu" was held. Centenaries were commemorated—Daudet, Zola, Rodin. Newspapers and periodicals brought their sizes nearer to normal, and the printing firms resumed their business.

Paris was surrendered on the 13th of June; but on the 1st and 8th the *Nouvelles littéraires* still came out, printing reports of a Charles Péguy commemoration at the Comédie Française, the election as members of the "Institut" of the Villon scholar, Pierre Champion, and of the Balzac scholar, Marcel Bouteron. Books had kept coming from the press, tragically optimistic on the outcome, like Joseph Pesquidoux's *Un petit Univers*—which was the garden of France that one must cultivate in peace to remain faithful to the old mother country; or like G. Duhamel's *Positions Françaises*, a continuation of *Mémoires sur la Guerre Blanche* (1939), with the theory that Totalitarianism is a result of materialism and of the mechanization of life. Roland Dorgèlès, the author of *Croix de Bois*, in his *Retour au Front* returned from the Maginot Line quite certain that the soldier of 1940 was fully as sure of victory as the "poulu" of 1914. And one read with delight the witty and gay pages written by Amédée Pavart, *Pavart s'en va-t-en guerre*, telling of the mobilization of Sept. 6-8, 1939.

Then all of a sudden France is invaded, and illustrious refugees come to these shores—André Maurois, Paul Hazard, Jules Romains, Henri Bernstein, and others. Of course all publications come to a sudden stop, as Pasteur's *Correspondance*, prepared by Robert Valléry-Radot, of which just one volume had come from the press; the great *Encyclopédie*, *La Civilisation écrite* (under the direction of Monzié) was interrupted after the 18th volume; so was François Mauriac's *Journal* after the third volume. Jules Romains's *Hommes de Bonne volonté* could not go on, neither could Henri Troyat's *Judith Madrier* which was to have a continuation of at least one more volume. Of course, *Quatre mois au front*, by Chamson will never be continued.

Some papers and reviews have tried hard to face adversity [and very few copies were received in America]. The *Odyssees* of *L'Illustration* offers a good example of the difficulties to be overcome. The last number distributed was that of June 8; the 15th of June number had been all printed but has remained undistributed; the publishers tried to go to Tours, but could not stay and went on to Bordeaux where three numbers were printed in reduced size; then they tried Clermont-Ferrand and printed nine numbers, again in reduced size; and only since September 14 have they succeeded in coming to normal—but in Lyons.

**Poetry.** In *Le Temps* of January 13, Robert Kemp revealed that Fr. Mauriac, the novelist and playwright, had been in his younger years a poet, and that some of his poetry formed part of his last story *Les Chemins de la mer*. The theme of the philosophical verses is the struggle between Cybèle, who represents nature, and man; nature tries to seduce mortals and tear them away from their aspirations for spiritual redemption. This is indeed the Mauriac of the somber novels he has consistently signed which brought to him the honor of the French Academy. It has been said that the dire consequences of war for humankind brought about

a revival of religious aspirations; this is borne out certainly in the field of poetry. Among the successful poets of the early part of 1940 several are profoundly Catholic; such as Jean Cayrol, author of *Phénomènes célestes* (Cahiers du Sud), and of *L'Âge d'or* (Cahiers des poètes catholiques); or as Raymond Millet, author of a *Poème de la Messe*, which offers a sort of lyric dramatization of the ceremonies of the holy mass: "Introibo," "confiteor," "Credo," "Gloria," etc. It must further be remarked that some of the most important "Prix de poésie" went to religious poets: "Prix Desbordes Valmore," to Rose Malhamé, for a collection called *Au Dieu inconnu*; "Prix Petit-Didier" (15,000 francs) went to Fernand Rivoire, for his general work; also entirely in the most idealistic note, the "Prix Louis Le Cardonnell" (who was a priest himself) to Fernandet, for the latter's collective works. Let us not forget the well known inspired Jewish poet, Edmond Fleg, who as early as 1913 had started on a long epic of the Jewish creed with *Écoute Israël*. He offered in 1940 a second part of his ambitious philosophical poem under the title *L'Éternel est notre Dieu*, and he announces the third and last *L'Éternel est Un*. Other poets are Mme. Marie Cossa, who was awarded the "Prix Blémont"; Philippe Dumaine, who received the "Prix Verlaine"; Paul Prist, who earned the "Prix Allan Poe" (reserved to a non-French poet) for *Messages*. (Paul Prist is a Belgian, editor of the well known *Indépendance Belge*.) A warm welcome was extended to a young woman poet, Andrée Homps, who published a first collection called *Disparates*.

**Theater.** Here as in other domains, efforts were made to continue active as much as possible, in spite of the war. The company of the "Comédie Française" completed a triumphal tour through several European countries, playing especially Racine's *Andromaque* (1939 had been called the Racine year, on account of the tri-centenary of the poet's birth), and Méréimée's *Le Carosse du Saint-Sacrement*. The students of Professor Cohen, of the Sorbonne, the "Théophiliens" as they call themselves, kept reviving medieval plays for scholarly audiences. So little was dreamed of the sudden stop in June that in May, when Edouard Bourdet, the director of the Comédie Française, was temporarily incapacitated by an accident, it was thought expedient to appoint Jacques Copeau as a substitute—a very short-lived function indeed!

The influence of the war was felt, however, on the stage. Fewer new plays were produced, and interest in what they call "revues"—i.e. humorous comments on events of the day on the stage—was more intense than usual. Plenty of material for satire was provided by political and military happenings. The two best known *revuists* in Paris in some years have been Rip, who wrote *Quelque part . . . à Paris*, and De Létraz who offered *Familiare*. In the cabarets, the "chansonniers" shared in this popularity with their witty comments in lines composed on popular tunes. A revival of "Marionette plays," offering distraction to soldiers in the leisurely first weeks of the war, were provided where real actors could not be produced, and from the front the boom of wooden actors passed to the rear of the lines.

As for the plays themselves, one only stood out as an actual war-play, *Eltvire*, by Henri Bernstein, built on the background of the horrors of the ruins brought about by the invasion and the horrid destruction in Czechoslovakia and Poland. A play by

André Savoir, *Banvo*, about air-raids was produced again. The bulk of theatrical activity consisted of "reprises" of successful plays of recent years, such as Balzac's *Le Faiseur* (Atelier), Giraudoux's *Ondine* (Athénée), Racine's *Phèdre* in modern scenery (Montparnasse), Stève Pas-seur's *Je vivais d'un grand amour* (Oeuvre). Of new plays, one may mention Maurice Rostand's *Le Roi de France*, which pictures the Count de Chambord who, in 1873, lost the throne of France because he refused to accept the flag of the Revolution. (Did the author think of the Duke of Windsor, or simply of the recent and sporadic attempts of the royalists in France to re-establish the monarchy?) Sometimes in order to forget the war, the public favored lighter plays, or at least such as would not remind them of war. Jean Cocteau called "comédie légère" his *Les monstres sacrés*, which tells of two stage artists deeply in love with each other, but whose serene life is spoiled temporarily by a mythomaniac. Another play by one of the theater celebrities was *C'était l'histoire de rire* by Armand Salacrou, called by the author "farce dramatique"—an ultra-modern theme treated frankly but with indisputable psychological insight; i.e. married couples who imagine to exchange mates—"histoire de rire." Claude-André Puget, who had earned such recognition in 1938 with his play *Les jours heureux*—hailed as a sort of new Musset or Edmond Rostand on account of the light, charming, witty, youthful spirit of his theater—offered *Ce petit ange n'est rien du tout*; he did not, however, achieve a success comparable to that of two years earlier; the scene is in the artists' quarter in Paris, where, for a time only however, a sort of Ariel appears, called here Myriel. Sacha Guitry's never exhausted vein inspired him with an amusing comedy, *Florence*, preceded by a little stunt—before the curtain rises, Sacha Guitry comes before the public and says that a woman in the audience has threatened to shoot at the actors because she has been told that the marital complications enacted are her own adventure!

**Novel.** A few comments first on some novels which had remained quite unnoticed during the last weeks of 1939 on account of the war but received due attention early in 1940. The "Prix Femina," Paul Vialar's *Rose de la mer*, tells a sea adventure and of rough sailors who experience something that reminds one of the famous Bret Harte story *The Luck of Roaring Camp* (a little child born at sea makes very human beings of those rough men). The "Prix interallié," *Les Figurants de la mort* is a story in which a socialist leader succeeds in enlisting men for a revolutionary coup by making them believe that they are just fighting a mock battle for a film. In view of the war events Varillon's *Massacre des Innocents* has inspired some new debates; the theme is that of Paul Raynal's play *Tombeau sous l'Arc de Triomphe* (1924 and 1929): Has the generation of the first world war not been cruelly sacrificed to the pre-war generation which succeeded in reaping the advantages the 1918 victory?

It was during 1940 that the Canadian writer Ringuelet (real name Dr. Philippe Panneton) came to his own in France; the French Academy had awarded him its "Grand Prix du roman" in 1939 for *Trente arpents*, but political events precluded its success with the public; then in 1940 another award was made, the "Prix des Vikings," and the book which had been at first printed only in Montreal was advertised by the well known Flammarion

firm. (The book was also published in translation by Macmillan, New York.) It is a story of a French Canadian family, somewhat the same milieu as that of Louis Hémon's famous *Maria Chapdelaine*. An honest "habitant" is fairly prosperous in his farm, but has to face the challenge of the new generation which lacks respect for old traditions. Here belongs also Marcelle Tinayre's *Est-ce un miracle?* a keen analysis of a religious soul that reminds one of the novel that made her famous in 1902, *La Maison du Pêché*.

Jules Romains's last published volumes in the collection *Hommes de Bonne Volonté*—what will be the fate of the continuation?—are (XVII) *Vorge contre Quinette*, the story of some unsavory dealings of a bookbinder during the first world war, dealings which had passed unnoticed by the courts, but were taken up after peace had been restored (Vorge is a naïve or a shrewd eccentric who happens to be involved too); and (XVIII) *La douceur de vivre*, which tells of an idyllic liaison at Nice between a young intellectual and a pretty "fleuriste" in the days that followed the strenuous years now over. Roger Martin-du-Gard ends his "roman fleuve" with *Épilogue*, giving the philosophical testament of the old scientist Antoine Thibault; he dies discouraged; his hopes for a "Wilsonian" peace ideal is shattered: Mankind can only try to accept courageously its inhuman destiny. Claude Farrère in his *La onzième heure* takes us to Asia which he knows so well and suggests a faithful psychology of the representatives of the two great nations involved in the gigantic conflict, the Japanese and the Chinese. A similar attempt is made for the two nations at war in western Europe, the French and the Germans; Jacques Moreau, in his *Intelligence avec l'ennemi*, introduces two young men, one from the East, the other from the West of the Rhine, who had become acquainted before 1914, exchanged letters with respect to each other's country, trying to iron out disagreements; both are open minded, the Frenchman, however, after having understood the claims of Germany immediately after the Versailles Treaty, cannot accept the Hitler gospel.

From the novels that have no especial connection with the present wars, the few following may be picked out: Simenon's *Le Bourgmestre de Furnes*, in which the author treats the psychology of remorse as he often has done before. Somewhat in the same vein is the novel by Jean Schlumberger, *Stéphane le Glorieux*—the hero lives in the near East, the lands of everlasting wars; he is considered boastful, but is one day to realize that he has brought about the death of a fellow man, and can no longer free his mind from the remembrance. Jean Cocteau, the cryptic author who is or is not a surrealist, returned to his career. He had published a mystifying novel in 1913, *Le Potomac*, and has now produced a sequence, *La fin du Potomac*, which again can be understood by initiates only.

As was to be expected, the depressing note is not lacking in the 1940 crop of French novels. Reflecting something like a somber anticipation, we are treated to a gallery of despondent people, not seldom cases of morbid discouragement; Jean Guirec (author of the recent *Maison au bord du monde*) writes *Le crime des indifférents*; Christian Mégrét, also known before for his pessimistic outlook on life *Les fausses compagnies*; J. P. Sarthe (author of *La Nausée* and of *Le Mur*), *L'Imagination*; Drieu de la Rochelle, *Gilles*; Bertrand de la Salle, *Monfenil* (conflict between gen-

erations); Germaine de Beaumont, *Les clefs*. Not quite as gloomy, are Louis Aragon, *Voyage sur l'Impériale*; Claude Silve (*C'est De Laforest Divonne*), *Le Palerstin*; A. Colling, *Demain-Relâche*; Pierre Benoit, *Les environs d'Aden*; and, actually written in a light vein, is René Joglet's *Valparaiso*.

Two short story collections might be indicated: Peisson, *La carte marine* (nine moving stories), André Armandy *L'Arc-en-ciel de lune* (six stories).

**Miscellany.** Publications of a strictly timely interest—war—have been mentioned. A few have no direct connection with present day events. Several volumes are souvenirs of early life: Ch. Maurras's *Images de mon enfance*; Ch.-F. Ramuz, the French Swiss writer tells of his student days in *Paris, Notes d'un Vaudois*; Fr. Carco was lucky enough to bring to a conclusion his autobiographical *Souvenir Bohème d'artiste* (vol. 5); F. Baldensperger, *Une vie parmi d'autres*, is printed and was ready for going on sale when the war broke out; Jacques Chadourne, *Chronique privée* is not so much an autobiography as a sort of soliloquy on life—something of the order of Montaigne's *Essais*. The souvenir of Clémenceau, the "Tiger" of the last war was vividly evoked by his great friend General Mordacq. The Jewish problem is taken up by one of the sharpest French pens of our days, Robert Vallery-Radot: *Israël et nous* does not try to hide the seriousness of the question, but, of course, cannot accept for one moment the brutal solution given to it by modern apostles of barbarism; it could be solved if the Christians would endeavor to convert the Jews to their philosophy of life. Auguste Bailly publishes another of his fascinating books of history, *Byzance*. Henri Bordeaux, in *Crimes involontaires*, has three striking stories: "*Marie Ravelle, empoisonneuse*," "*Infanticide*," and "*Paricide*."

**History of Literature and Criticism.** A great collective work, sponsored by the "Nouvelle Revue Française," *Tableau de la littérature française*, could not be finished on account of the war, but stopped with the 18th century. The authors of the different chapters are all men of high reputation, such as Alain, Thibaud, Valéry, etc. Several scholarly books could come from the press before the invasion: A large volume on *Claude Fauchet*, the historiographer of Henry IV, by J. P. Espinet-Scott; three belated books on *Racine*, by Saint-René Taillandier, by Dimier, and by Crouzat; a captivating volume by Georges Mongrédien on *Marion de Lorme et ses amours* (the Marion of Victor Hugo's drama); Vianey offered a new *Psychologie de LaFontaine*. Daniel Mornet, once more gives proof of his formidable erudition in a *Histoire de la Littérature du XVII<sup>e</sup> siècle; ses caractères véritables; ses aspects inconnus*. Two French professors at Hunter College, Henri Dupont and René Taupin, wrote a *France au XVIII<sup>e</sup> siècle*. Two books on Lamartine, one by H. Guillemin, *Lamartine*, the other by a young American scholar, A. J. George, *Romantic Unanimism*. Very interesting is a volume on *Balsac à Fougères*, by E. Aubrée; another, no less interesting, is by Paul Souchon, *Olympio et Juliette, Lettres inédites de Juliette et de Victor Hugo* (Juliette was to Hugo's *Tristesse d'Olympio* what Madame Charles was to Lamartine's *Le Lac*). At last an exhaustive volume (850 pp.) came out on *Alphonse Daudet* (whose centenary was commemorated), by a very conscientious lady, Yvonne Martinet. At the same time Léon Daudet publishes

some *Souvenirs inédits* about his father. A new book on Mallarmé whose fame seems to be still gaining, by E. Noulet, *L'Oeuvre poétique de Mallarmé* (584 pp.). Two works on *Baudelaire*, one by Blin, the other by an Italian, Giovanni Macchia. A study on *La géographie de Marcel Proust*, by André Ferré, and a very important new edition, brought up to date, of René Lalou's well known *Histoire de la Littérature française contemporaine*, bring us to the 20th century.

In closing, let us mention an open *Lettre à l'Académie Française*, by the famous French linguist, Albert Dauzat, asking for spelling reform. It was in *Le Français moderne*, April number, and came after several articles in the same review giving in detail the arguments for resurrecting the old problem.

ALBERT SCHINZ.

**FRENCH SOMALILAND.** See SOMALILAND, FRENCH.

**FRENCH SUDAN.** See FRENCH WEST AFRICA.

**FRENCH TOGO.** See TOGO, FRENCH.

**FRENCH WEST AFRICA.** A French colonial federation made up of the colonies shown in the accompanying table

Colony	Sq. ms.	Pop. (1937)	Capital
Dahomey .....	43,232	1,289,128	Porto Novo
Dakar*	60	126,929	Dakar
French Guinea.....	96,886	2,065,527	Conakry
French Sudan .....	590,966	3,635,073	Bamako
Ivory Coast .....	184,174	3,981,459	Abidjan
Mauritania .....	323,310	370,764	St. Louis*
Niger .....	499,410	1,809,576	Niamey
Senegal. ....	77,730	1,666,374	St. Louis
French West Africa	1,815,768	14,944,830	Dakar

\* Including dependencies    \* The lieutenant-governor of Mauritania resides in St. Louis, Senegal

Chief towns: Dakar (the capital), 42,000 inhabitants; Kaolack, 39,981; St. Louis, 35,927; Porto Novo, 27,483; Bamako, 26,182; Abidjan, 26,143; Thiès, 18,915; Bobo-Dioulasso, 18,589; Kayes, 16,036.

**Production and Trade.** The principal agricultural products are groundnuts, maize, rice, palm kernels and oil, cottonseed, coffee, cotton, tobacco, sesamum, and cacao. Gold was the chief mineral produced. Trade (1938): Imports, 1,627,200,000 francs (textiles, fuel oil, machinery, foodstuffs, and beverages were the chief items); exports, 1,416,100,000 francs (franc averaged \$0.0288 for 1938; \$0.0251 for 1939).

**Communications.** In 1938 railways extended 2453 route miles. There were 8314 miles of telephone line and 21,457 miles of telegraph line. The road mileage in 1939 was 33,565 and the number of motor vehicles was 15,783.

**Finance.** The various budgets in the financial estimates for 1938 balanced as follows: General budget, 335,000,000 francs; local budgets, 498,162,000 francs; supplementary budgets, 293,102,486 francs.

**Government.** The federation of French West Africa is under the general rule of a governor general, aided by a council. Each colony is administered by a lieutenant governor, subject to the governor general at Dakar.

**History.** French West Africa was one of the main theaters of the struggle for control of the French colonial empire that broke out between the

Vichy Government and the adherents of Gen. Charles de Gaulle's "Free French" movement following the capitulation of France to the Axis powers in June, 1940. On September 23 a de Gaulle expedition, supported by British and "Free French" warships, attacked Dakar in an attempt to wrest control of the capital and chief port from pro-Vichy officials. The attack was repulsed by shore batteries and warships loyal to the Vichy Government. Numerous adherents of General de Gaulle were arrested and imprisoned. The pro-Vichy authorities in French West Africa, headed by Gov. Gen. Pierre Boisson, were still in control at the year's end.

**GAMBLING.** See FLORIDA and ILLINOIS under *History*.

**GARBAGE AND REFUSE DISPOSAL.** Incineration of garbage and refuse continues to increase in favor, but this method is far from taking care of all of the huge aggregate of these materials gathered by municipal and private scavengers. Much garbage and refuse is dumped unceremoniously on vacant land; a few cities have such dumps under engineering control, covering the waste material with ashes or earth, thus forming sanitary fills and converting mosquito breeding or other idle spaces into park or building areas. The country over, a large percentage of the garbage collected is fed to hogs. For the most part this is done by private collectors under as inadequate engineering control as is exercised at the
